REPORT

OF

THE COMMISSIONERS

APPOINTED TO INQUIRE INTO THE

SEA FISHERIES OF THE UNITED KINGDOM.

Vol. II.

MINUTES OF EVIDENCE AND INDEX.

Presented to both Houses of Parliament by Command of Her Majesty.

LONDON:
PRINTED BY GEORGE EDWARD EYRE AND WILLIAM SPOTTISWOODE,
PRINTERS TO THE QUEEN'S MOST EXCELLENT MAJESTY.
FOR HER MAJESTY'S STATIONERY OFFICE.

8077. 1865.

LIST OF PLACES VISITED.

ENGLAND AND WALES.

Name of Place.	Date of Visit.	No. of Question in the Evidence.	Name of Place.	Date of Visit.	No. of Question in the Evidence.
Billingsgate (London)	18th Nov. 1863	12,402–13,507	London	9th March 1865	58,753–59,022
Boston	28th Nov. 1863	15,156–15,893	„	16th March 1865	59,840–61,041

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SEA FISHERIES COMMISSION.

Cullercoats, Northumberland, 22nd September 1863.

COMMISSIONERS PRESENT :

JAMES CAIRD, Esq., M.P. (Chairman). | Professor HUXLEY, F.R.S.
G. SHAW LEFEVRE, Esq.

The Rev. ROBERT FAULDING WHEELER called and examined.

1. (*Mr. Caird.*) You are the incumbent of this parish, I believe ?—I am the incumbent of the parish of Whitley.

2. How long have you resided in this parish ?—I have been here about two years and a half.

3. Have you directed your attention much to the question of fisheries ?—Very much indeed. Having a population under my care who are chiefly engaged in fishing, I have considered it my duty to make myself acquainted with the subject.

4. Can you tell me what is the population of Cullercoats ?—The population at the last census was 866. I speak of those who are dependent upon fishing. Of course it has very much increased since then.

5. Does that embrace the whole number with regard to whom your attention has been directed in reference to sea fishing ?—Yes, that is the fishing population of Cullercoats.

6. The fishing population ?—Yes.

7. Can you inform me how many boats are engaged in the fishery ?—There are 38 engaged in the 'white-fishing,' as it is called, that is the fishing for haddock, ling, cod, and so on.

8. Is that what is called line-fishing ?—Yes, it is line-fishing exclusively.

9. How many people are employed in each of these boats ?—I believe the boats carry three men, or three men and a boy each.

10. Is there any trawl-fishing upon this part of the coast ?—A few of the older fishermen follow trawling during the summer time for soles.

11. Is that the same description of trawling as that in which we are specially interested, namely, the beam trawling ?—No, the beam trawl used by the Cullercoats men is a very much smaller trawl than that which is used by the men from Hull and other places.

12. How many boats are engaged in that trawl-fishing for soles ?—About six, but I think it is only carried on during the summer time and by the older men. The trawl-fishing here is almost exclusively carried on by the older fishermen.

13. Is there any salmon-fishing ?—A few men occasionally go out during the summer time 'trouting' as it is called.

14. With regard to the herring fishery, is it practised here with any amount of success ?—Yes, the herring fishery forms the harvest, so to speak, of the Cullercoats men.

15. How many boats are engaged in the herring fishery ?—I believe there are about 40 boats engaged during the herring fishery.

16. Does that include the 38 which you say are engaged in the white-fishing ?—No, a herring boat is a rather larger description of boat, but it is manned by the same boatmen as those who are engaged in the white fishery.

17. The same boatmen use both descriptions of boats ?—Yes, the same boatmen generally ; there may be a few engaged in the herring fishery who come from other places.

18. Can you tell us the average product of the white-fishing ?—The average product of the white-fishing, as nearly as I can calculate, is about 5 stones per man per boat.

19. Is that the daily product ?—Yes, daily, and they may go out on an average perhaps four days in a week.

21. How many pounds do you reckon to the stone ?—14 lbs.

22. Then what would the monthly product be ?—About 32,000 lbs. of fish.

23. How many weeks during the year would each boat be engaged in the fishing ?—They would be engaged from about the end of September until the middle of July, when the herring fishery begins.

24. Then from the end of September until the middle of July the white-fishing takes place ?—Yes.

25. And the herring fishery begins about the middle of July ?—Yes.

26. And how long does it last ?—It lasts until about the middle or end of September, according to circumstances. This year it has been rather later than it is some years ; last year, if I remember rightly, it ended about the 15th of September.

27. Are there many different kinds of fish caught by the men here ?—Altogether, I believe, there are about 24 different kinds.

28. Can you name them ?—Yes, I think I can.

29. What are they ?—Haddock, cod, ling, skate, halibut, turbot, whiting, flounders, plaice, thornback (that is one of the ray fish), cat fish.

30. They do not eat cat fish, do they ?—Yes, they are one of the most delicious fish caught on the coast, although I admit they are very ugly to look at.

31. What other fish are caught here ?—Mackerel, soles, crabs, lobsters, gurnet, salmon, trout, 'sea sow' (I do not know what that is), eels, conger eels, wrasse, hake (very rarely), tusk (also rarely), and black jack or coal fish.

32. Can you tell us the proportion of each kind of these fish that is caught weekly ?—I do not know that I can give you the proportion caught weekly.

33. Can you give us the proportion in reference to the whole ?—Yes, with regard to the whole I can. Haddock would stand No. 1.

34. Can you tell us the weight of haddock caught ?—No, I cannot possibly do that.

35. Can you give us any idea ?—No, I am afraid I cannot ; I have tried to ascertain, but I have been unable to succeed. Haddock would stand No. 1 ; cod, No. 2 ; whiting, No. 3 ; ling, No. 4 ; skate, No. 5 ; thornback, No. 6 ; halibut, No. 7 ; flounders, No. 8 ; soles, No. 9 ; plaice, No. 10 ; gurnet, No. 11 ; and eels, No. 12. I think we need not go beyond that.

CULLER-COATS.

Rev. R. F. Wheeler.

22 Sept. 1863.

36. Have you made up any statement with regard to the total quantity of fish caught from the end of September to the middle of July?—No, except a rough one arising from the monthly statement, 32,000 lbs. a month.

37. They fish for about 10 months, or about 42 weeks?—Yes.

38. Then you think it would be a fair estimate of the quantity of fish taken to multiply the number of months from the end of September to the middle of July by 32,000?—Yes.

39. That would amount to 320,000 lbs., or 142 tons in the whole?—Yes; I was very careful in making that estimate, and I strove to be under the mark rather than above it.

40. Are you aware of your own knowledge whether or not that supply is increasing or diminishing annually?—I am not aware of my own knowledge. From the statements I have received from others engaged in the fishery, I believe that the quantity is decreasing, and I believe that the average earnings of the men are decreasing.

41. You have no facts to lay before us to establish the correctness of that statement?—No, I have not.

42. Your own knowledge, or the information you have received, does not enable you to furnish us with facts?—No, I would rather leave it to men who have been engaged in the fishery all their lives to speak upon that subject.

43. Speaking of the herring fishery, can you tell us what quantity of herrings is caught here during the season?—I cannot; but there are witnesses here who will be enabled to give you full information upon that point.

44. What is the bait which is principally used in the white-fishing—the white line-fishing?—Mussels.

45. Do you happen to know the quantity of mussels which is used for bait?—About 16,000 bushels per annum; in addition to that a large quantity of dog-fish, crabs, sea anemones, and sand eels are also used for bait.

46. Where are the mussels obtained; are they got off this coast?—They are obtained chiefly at the mouth of the Tyne and partly from Stockton; they even come so far as from Boston in Lincolnshire.

47. Has anything interfered to diminish that supply of bait?—Some time ago the supply at the Black Middens at the entrance to the Tyne fell short, but it is now increasing again.

48. Was there any particular cause for that?—I think the cause was that the beds were rather overdrawn upon; they used them much too freely.

49. Are crabs and lobsters caught here to any extent?—Yes; there is considerable crab and lobster-fishing during the spring months.

50. Do you know whether the crab and lobster-fishing is improving or declining?—I believe that this year it has not been quite so good as usual.

51. But there has been no marked decline?—Not that I am aware of.

52. Have you any opinion to give as to the injurious character of any particular mode of fishing practised upon this coast?—I believe that the trawl-fishing tends to the destruction of the spawn deposited upon the ground; but I know nothing whatever except from statements which have been made to me.

53. You have no particular knowledge upon the subject yourself?—No, I have no personal knowledge, but there are persons in this room who I believe have been engaged in trawling, and who can give you evidence upon that point.

54. I see a statement made here by you in a paper I hold in my hand in regard to the corporation of Boston. You say that the corporation of Boston imposed some regulations which had the effect of enormously increasing the supply of mussels?—Yes.

55. What were the regulations which they established?—They prohibited the men from taking mussels under a certain size. When the mussels were taken they obliged the men to pass them through a riddle or sieve, and all the mussels which fell through the sieve were rejected; but it was found by the fishermen that the regulation thus established could not be enforced by law, and they now take the mussels indiscriminately. I believe the consequence has been that the supply has again fallen off.

56. Is there any other point you desire to bring before the commissioners?—No, I think not. I have no other evidence which would be useful to you. By-the-by I think I can give the commissioners a return of the number of fishing-boats engaged upon the coast of Northumberland.

57. We shall be very glad to have it. Will you be good enough to state what the number is?—Cullercoats, 38 fishing cobles; Blyth, 2; Newbiggin, 27; Cresswell, 5; Hauxley, 10; Amble, 1; Alnmouth, 7; Boulmer, 3; Craster, 14; Newton-by-the-Sea, 7; Beadnel, say 4; North Sunderland, 15; Holy Island, 16; making altogether 155.

58. In what way have you procured that return?—I obtained it by private inquiry. The information has been given to me by those who are practically engaged in the fishing.

59. Do you think the return is a correct one?—It is as correct a return as can be obtained.

60. (*Professor Huxley.*) I understood you to say that you have known this district only during the last three years?—I have been here only two years and a half. I am the first incumbent.

61. Have you obtained any information as to the condition of the people here during the last 20 years?—I have from conversations which I have had with persons in the district.

62. Can you tell me whether the social condition of the people here (of course I am speaking of the fishing part of the population) is better or worse than it was 20 years ago?—In what respect?

63. For example, with regard to their mode of living, do they live as well now as they did 20 years ago?—Not so cheaply or so abundantly, I should say.

64. That is not what I want to know. I wish to know if they live as well. I do not speak of the money they spend in mere luxuries and drink, as sometimes happens in the case of fishermen, but what I refer to is the substantial comforts of life?—I can hardly answer that question.

65. Has the number of fishing boats increased here.—Yes?

66. And is it still increasing?—Yes; I think it is.

67. Can you give us any idea of the increase?—No, I cannot personally, but I believe there are those in the room who can do so.

68. You doubtless hear a great deal from your parishioners about the social condition of the people and the condition of the trade here; do you think there is any existing law which at all interferes with the prosperity of Cullercoats?—Do you mean in reference to the fishing.

69. Of course, I am speaking in reference to the fishing?—No, I cannot say that any existing law does interfere with the prosperity of the place so far as the fishing is concerned.

70. You do not hear of any complaints on that score?—No; the great complaint which I hear here is of the interference of the trawlers.

71. Then the law as it stands is not complained of?—No, that is a question which never came before us at all.

72. (*Mr. Lefevre.*) Can you tell us whether the fish caught off this place are all brought into the haven here, or are they sent elsewhere?—They are taken chiefly by the women of Cullercoats, who sell them principally in what they call 'creels,' in Newcastle, Shields, and the immediate neighbourhood.

73. Then they are not sent away to distant markets by railway?—I believe that a certain quantity is sent away by railway, but the vast majority of the fish is disposed of in the manner I have referred to.

74. Then there is no mode of ascertaining the relative number disposed of in the immediate neighbourhood and sent to distant markets by rail?—No.

75. Do you know of your own knowledge, whether the absolute quantity of fish taken by the Cullercoats

CULLERCOATS.

Rev. R. F. Wheeler.

22 Sept. 1863.

fishermen has increased?—I should say that the absolute quantity brought in has, but the proportion per man has very greatly decreased.

76. Is the average of 32,000 lbs. which you gave, the average quantity taken during the winter months?—I think it is about the average taken in the whole season.

77. Is the fishing interfered with much by rough weather here?—Yes, sometimes it is put a stop to for days together.

78. The boats used here are small, I believe?—Yes; and they are all open boats.

79. But the winter is a good time for fishing, is it not?—Yes; the winter is the white fishing season. In the calculation I gave you, I only took four days a week as the fishing days.

80. You cannot tell us any mode by which we can compare the quantity of fish caught now with what used to be caught a few years ago. I mean, can you give us any other information than a general calculation made with regard to the subject?—That is the only information I can give you. I have no accurate statistics as to the weight of fish brought ashore on any part of the coast.

The witness withdrew.

ROBERT NICHOLSON called and examined.

R. Nicholson.

81. (*Mr. Caird.*) Are you a native of this place?—Yes.

82. Have you been many years engaged in the fishing here?—Yes; I have been engaged in it for 49 years.

83. Have you been engaged in all the different kinds of fishing practised on this coast?—Yes; all the fishing used in this place I have been at.

84. Have you heard the evidence of Mr. Wheeler?—Yes.

85. I presume that you agree with him as to the period during which the different kinds of fishing last?—Yes. The white-fishing lasts from the end of September to the middle of July, when the herring fishery begins.

86. Do you agree with Mr. Wheeler as to the average quantity of fish caught during that period?—I agree with him as to the quantity caught at the present time, but it is not now as it was in my day, not by a long way.

87. It is not so good at the present time as it was years ago?—No.

88. What is the weight of fish got on the average per man per day now?—On the average about 5 stone a man a day, when it is weather for them to get out to sea.

89. Comparing that quantity with your earlier knowledge, say 30 years ago, how much has that daily average fallen off?—I should say one-half.

90. What was the quantity which each man got at the time to which you refer?—I have known 60 stone got in one coble in the course of the day.

91. How many stones a day are got now?—Not more than 15 or 16.

92. Were the 60 stones you speak of an average during the whole of the season?—No; that quantity was got in the winter season when we could get to sea.

93. Was the season the same as that to which the 15 stone would apply?—Yes, just the same.

94. Do you mean to say that a man 30 years ago could get 60 stones of fish where now, using the same exertions, he could only get 15?—Not one man, but three men.

95. There are three men in a boat?—Yes, three in a boat; and I have known them get as much as 60 stone in one day. That has been the take in one boat with three men.

96. Was that beyond the ordinary average; was it beyond a common day's fishing?—Yes; they were drove in by heavy gales of wind.

97. Are the fish ever driven in now by heavy gales of wind?—There are heavy gales; but as to the fish there are none to drive in. You know they cannot be driven in when there are none.

98. Then it was during the heavy gales of wind that you always got the most fish?—Yes, we often got a good deal of fish after a heavy gale; the take was very often as much as 40 stone in a day in one boat.

99. For how long would the take continue at 40 stone a day?—It would continue up till after Christmas, perhaps till the middle of February, and then they would begin to take off.

100. What would the take fall to then?—They fell away during the spawning season. After Christmas the haddock would be busy spawning, and it was then that they took away, and we got very little until the month of May, when they began to come in again.

101. And then after the month of May how much would you average in a take, I mean in the old time to which you refer?—Sometimes we would get as much as 40 or 50 stone a day in the month of May, and sometimes we should not get so much.

102. Would you on the whole say that a boat and its crew 30 years ago would get double the quantity of fish during the fishing season that it gets now?—Yes, I am perfect on that point.

103. You are quite certain on that point?—Yes, I am perfectly certain that we could get double the quantity of fish that we can get now.

104. You could get double the quantity during the fishing season?—Yes, we could.

105. You are speaking now of 30 years ago?—Yes.

106. What was it 10 years ago?—It has declined little by little, especially during the last six years.

107. Then 10 years ago was the fishing as good as it had been 30 years before?—I daresay it was; there would be little difference 10 years ago. I was then a servant to a gentleman. I was not engaged in fishing, but I had to look after boats that were engaged here, and to send the fish off to Birmingham for a fishmonger there, and I should think that many a day I sent off 60, 70, 80, or 100 stone a day to Birmingham, besides 60 or 70 cod fish in the season; but now when I go down on the sands on a morning, I do not think that there is such a thing as a cod fish to be got.

108. How many boats were engaged in fishing there at the time you speak of, 30 years ago?—There would be about 23 or 24 boats.

109. How many men were employed at that time in fishing?—I should think about 70.

110. Then there has been a considerable increase both in the number of boats and in the number of men?—There has so.

111. And have the returns the men have received for their labours been less during the last 10 years than they were during the earlier period to which you allude?—The fish were much larger in those days, and they were sold much cheaper. For instance, I have known the haddocks of those days to measure from 13 to 18 inches in length. Of course 18 inches was rather out of the way, but still I have known them as large as that.

112. Are the haddocks got now-a-day not so large as they were then?—No; they are all taken now before they come to that size.

113. You think they are taken at an earlier stage of maturity than they used to be?—Yes, they are all taken before they get that old. If you had not taken the measures that you did with regard to the salmon, I think you would not have had a salmon at all some years hence, and so it will be with regard to the haddocks. If this trawling is not done away with there will be no haddocks at all. With regard to haddock-fishing, trawling destroys the spawn. The haddock when she lays her spawn lays it along the bottom.

CULLER-COATS.

R. Nicholson.

22 Sept. 1863.

It comes to a ball; then it lies perfectly solid on the ground until it takes life. Now, when these trawls go over the ground, if there was a shilling lying on the ground they would take it from the bottom. The consequence is that they take all the spawn away, and there is nothing left at all to breed from. It is just the same as the locks in the river with regard to the salmon; if those locks were not done away with there would have been no salmon. It is just so with the haddock; if trawl-fishing is not done away with you will have no haddocks in a couple of years more. England will cry out for want of fish if this trawling is allowed to go on.

114. Have you observed since the railways have been extended down to the coast here that there has been a much higher price paid for fish than there used to be in former years?—If there had not been a better price given for fish the fishermen could not have lived at all.

115. Then the price has increased?—Yes, it is more than double what it was in my day. We were nine in family, but my old woman could get a haddock for twopence which would serve for all our dinners, the whole nine of us. I had nine of them in family at home for some years, but she would not get as much now for 9*d.* or 10*d.* as would serve the same number for dinner; the price has a long way more than doubled.

116. Is the increased price, in your opinion, the cause of the increase in the number of the fishermen and in the number of boats to which you refer?—It was sure to do that, for the male population are all fishermen's sons, and they take to the fishing.

117. Can you tell me if you are as well off with that increased price as you used to be when you had a larger quantity of fish and sold it at a lower price?—I do not think I am. I think I was better off in my earlier days than the fishermen are now with the increased price they get. They do not get anything like the number of fish we used to get in my day.

118. Then it is your opinion that although there is an increased number of men and boats there is a diminished quantity of fish on the whole, caught on this part of the coast?—There is not one half of the fish caught now that were caught in my day.

119. Not by all the boats put together?—No, I am not taking one boat more than another.

120. Do you think that the 24 boats which you had 30 years ago, caught more fish than the 30 boats which are now employed in the fishing?—Yes, they caught a long way more.

121. Do you think that there is a destructive mode of fishing practised off this coast?—Yes, I do.

122. Is it practised by any of the fishermen of this coast?—No, not by the fishermen on the coast.

123. None of the people of Cullercoats practise that destructive mode of fishing?—None at all; they all fish with a hook, only at a certain time, when they fish with a small trawl close under low water merely for small soles.

124. Is there any spawn where they fish with the small trawls?—I cannot say if there be any or not, but I know that they do not get any in their small trawls.

125. Did you never see any spawn taken up in the small trawls?—No, I never did.

126. Have you ever heard of its being taken up?—No, I never heard of it.

127. You never heard of any loss to the breed of fish being sustained in consequence of trawl-fishing in shallow water?—No, and for this reason; because, I think, the soles were in-shore, going into the rivers to spawn.

128. Do you speak from your own personal knowledge of the matter?—Yes.

129. And you in practising this system of trawling in shallow water never found that the spawn was disturbed, or that it came up in your trawl?—No, it never came up in the trawl in-shore.

130. (*Professor Huxley.*) In what depth of water do you trawl for soles?—About 3 fathoms.

131. Then in water within 3 fathoms in depth you find no spawn?—No, I think they go up the rivers to spawn?

132. (*Mr. Caird.*) Then who is it that practises this wasteful system to which you attribute the destruction of the fish?—It is the smacks which fish off the coast.

133. Do the smacks come off your shore?—Yes, they do.

134. Within what distance do they come?—They are trawling within 5 or 6 miles, and from that to 8 miles.

135. Do you go out with your lines fishing to that distance?—Yes, some of our men do, and there are persons in this room who have lost all their lines.

136. From what cause?—Why, the smacks have taken them all away.

137. Do the smacks and your vessels go over the same ground?—Yes; but the trawls sweep the bottom. When our lines are stretched out on end the trawl comes down upon them, gets into contact with the lines, and takes them all away.

138. Have you yourself ever lost any of your lines in consequence of the trawls taking them away?—No, I have never been fishing since the smacks came off the coast; but there are others here who have lost their lines.

139. You have not been fishing since the trawling commenced outside?—No.

140. Then, if you have no knowledge yourself of the injury done by the trawling, if you have never fished upon the trawling-ground, you cannot speak distinctly upon that point?—I cannot speak any further than to tell you what I have heard from men who have told me of the loss of their lines.

141. Are there any men here who can tell us what they have seen?—Yes, there are men in this room who have lost their lines by the trawlers, and let me tell you, sir, that we are sure they disturb the spawn and take it all away, and when once it is disturbed it will take no more hold.

142. How are the boats manned here; how many men are there in a boat?—There are three men and a boy in each boat.

143. That is for line-fishing?—Yes.

144. Is one of the three the proprietor of the boat, or does the boat belong to all of them?—In the case of some of the boats one man is the proprietor, in the case of others they join together and have a boat among them.

145. Does the proprietor usually fish in the boat?—Yes.

146. Then, I suppose you share the fish according to the property and the number of men in the boat?—They do not keep their fish together at all, they keep it separate. Every man keeps what he gets on his own line, and then his own wife goes away with them and sells them at market.

147. That, I suppose, is where the ownership of the boat is divided among the men. On other occasions does not the owner get a share for the boat?—No; there is nothing of that here.

148. Then, I am to understand that each man gets what he fishes?—Yes.

149. (*Mr. Lefevre.*) Are any wages paid here?—No.

150. Does the owner of the boat get no advantage?—No, none at all; they have different cobles and they shift about. For instance, one man uses his coble for three months and then another man will use his for three months.

151. Each of them will have his own coble?—Yes.

152. (*Professor Huxley.*) I understood you to say that you have been fishing here for more than 30 years?—Yes, for the last 49 years.

153. Can you recollect when the beam-trawling began outside?—Yes, very well.

154. How many years ago will it be?—It is about six years since they first came here; but I do not know how long it is since they began southward.

155. They began here about six years ago ?—Yes.

156. You mentioned just now, that up to 10 years ago, so far as you knew, there was no particular difference in the catch of fish ?—No.

157. But I also understood you to say that you were not fishing at that time ?—No, I was not.

158. Then you would not be so likely to know as if you had been fishing ?—O yes; I was taking the fish all that time, and I knew as well as if I had been at the fishing. I was taking the fish in and sending them off to a gentleman, a fishmonger at Birmingham.

159. Were you taking in the fish six years ago when the trawling began off this coast ?—No ; I was fishing then.

160. You were fishing yourself ?—Yes.

161. Then you would be in a position to know what the fishing was ?—Yes ; the fish had fallen off to that extent, that the gentleman for whom I was employed could no longer pay the money necessary to send them off to Birmingham ; there was such a scarcity of fish.

162. How long ago is it since the fish began to fall off and obliged the gentleman to whom you refer to give up buying them ?—About five years ago.

163. So that, as the trawling began six years ago, the very year afterwards there was such a diminution in the take of fish that he was obliged to give up his business ?—The men gave up taking the fish.

164. Do you attribute that decrease to the trawling ?—I think that it arose partly from the trawling. The trawling had only commenced then off our coast ; but I do not know how long it had been practised in other parts before that.

165. I thought you said it commenced here six years ago ?—Yes, upon this coast ; but you must understand that all the fish do not breed upon this coast.

166. You say that you know the fish were very abundant up to 10 years ago, and that the supply of fish fell very short about five years ago ?—Yes.

167. About six years ago you say the trawlers began to come upon this coast ?—Yes.

168. That is all within your own knowledge ?—Yes.

169. About six years ago they came upon this coast, and ever since that you say the fish have diminished ?—Yes.

170. Did you ever see haddock spawn ?—No.

171. You mentioned that the spawn of a haddock goes into a ball ?—Yes ; I do not say that from having seen it myself, only from hearsay. I believe it is the same with the spawn of the herring.

172. But you never saw haddock spawn ?—No.

173. Then how do you know ?—All spawn goes into a ball. As soon as the fish shoot the spawn it goes into a ball. I have seen different kinds of spawn from fish, but I never saw haddock spawn.

174. You said just now that every fisherman's son became a fisherman ?—Perhaps not every one, but nearly all of them. Some give their minds to the sea and some to other businesses.

175. Then the number of fishermen must be always increasing, and it increases every year ?—Yes, every year there is some increase.

176. Is it a very large increase ?—It has increased very largely since I came here. When I came here I only made the tenth coble ; there were nine before, and mine made the tenth. That was just after the loss of the lifeboat at St. Mary's Island.

177. That is 30 years ago ?—No, 49 ; perhaps 50 years ago.

178. The fishing population goes on steadily increasing, as well as the number of the boats ?—The boats increase but the fishing decreases.

179. Suppose there were no trawling, do you think that the fishing population would have gone on increasing in that way. If the number of people had gone on increasing would they always have caught the same number of fish ?—That is more than I can say, but we know that when the spawn is taken away there is nothing left to breed from, and there can be no fish come to life where the spawn is taken away.

180. Do you think that there must be a certain limit reached. Suppose, for instance, that 30 years ago you had 50 people fishing, and that now there are 100, do you not think that the time must come when the quantity of fish caught will begin to decrease, because there are more people engaged in catching them ?—No doubt there is a greater advance of people, but there is a larger decrease of fish than the advance of people has been.

181. Do you not think that there may be something in addition to the trawling to interfere with the spawning—the quantity of fish, for instance, may have decreased ?—I do not know; all I can say is, that they do not get the quantity of fish ; they do not get the quantity that even we did.

182. And you do not think that this arises simply from the increase in the number of fishermen ?—It does not arise from the increase in the number of fishermen, but from the diminution in the number of fish.

183. You are quite clear that you never heard of spawn being taken up in trawling for soles in shallow water ?—Not in shallow water; certainly not in water two or three fathoms deep, where the small trawls are used.

184. Then am I to understand that, in your judgment, the trawling in small boats in-shore does no harm to the breeding of fish ?—I never knew it to do so.

185. You were speaking just now of what, I dare say, is a very important matter, namely, the interference of the trawlers with the long lines. I understood you to say that the long-line fishermen lay out their lines, and that the trawlers come up and sweep them away ?—They put them down in the morning, and they lie there all day and night till the next morning. The vessels engaged in trawling over the ground come over them while they are lying there, and they take them away.

186. So that I understand beam-trawling does two kinds of harm—it destroys the spawn, and, in addition, it sweeps away the lines of the long-line fishermen?—Yes.

187. These are the two charges that you make against the trawlers ?—Yes.

188. One of these complaints is of course a question for discussion. With regard to the other, there can be no doubt that injury would be done in sweeping away the fishermen's lines. But have they no remedy? —They have never got any.

189. If a fishing boat were to sweep my lines, could not I summon the men engaged in it before the police magistrates ?—I do not know ; they never have done it.

190. Surely that would be like the destruction of a man's property in any other mode ?—I think the fishermen should have some recompence.

191. In the herring fishery, I believe that if a smack damages the herring-nets the fishermen can recover damages ?—Yes, I believe they can.

192. Then why cannot you do the same thing with regard to the long-lines ?—Perhaps we could if we were there present at the time, and able to get the number of the vessel that did the damage. No doubt in that case we should recover damages. But when we leave our lines there we come ashore with the fish that we may have caught in a previous haul. We leave them in the water until the next morning, and then when we go away to them the next morning we find that our lines are gone, but of course we do not know who has got them.

193. Can you suggest any kind of remedy for that? —I do not think that I can. I don't think that any remedy would do for it except to have this trawling knocked off. That is all that could be done. There is no other remedy.

194. Does it not happen sometimes that the fishermen take up one another's lines—I mean the long-line fishermen ?—I never knew it happen here.

195. I should be glad to hear if you have ever been told that such a thing has been done ?—Perhaps it may have been done, but not upon this coast.

CULLERCOATS

R. Nicholson.

22 Sept. 1863.

196. Then it is not a complaint here?—No, there is no such complaint amongst us as that.

197. Is there much herring-fishing here?—Yes, we have a good deal of herring-fishing.

198. How many boats are employed in the herring fishery?—I believe there are about 44.

199. Do you think that the beam-trawling does any injury to the herring-fishing?—Yes, I do; I think that the vessels which destroy the spawn must destroy the spawn of the herring as well as of other fish.

200. Do you happen to know whether the take of herrings has fallen off of late years?—Yes, the takes have fallen off all over the coast; they are not so numerous as they were in my time, not near hand.

201. Do you think that the herring spawn off this coast?—Yes; I am talking of getting them one night all full fish, and the next night they are all spawn fish.

202. Do you know whether any herrings are caught here in the early part of the year, in January and February?—No, we don't catch any then.

203. Do you set your nets then for herrings?—No.

204. There are herrings here at that time, are there not?—No, not at that season of the year. At the latter end of September we are all done.

205. (*Mr. Lefevre.*) Does the decrease of fish of which you complain relate principally to the white fish or to the herring?—It is a decrease all through; but the herring-fishing is not white-fishing.

206. Have you noticed the decrease more in one kind of fish than in the other?—We have noticed more in the white-fishing than in the herring.

207. Can you tell us whether the whole quantity of herrings caught off this coast is less than it used to be, or whether it is less per boat?—It is certainly smaller according to each boat—it is much smaller according to each boat. They do not catch anything like the quantity now that they caught in my day.

208. Do you think that the whole quantity is smaller?—Yes, or otherwise the boats and the nets they have now would get more, because they have larger boats and larger nets now than we used to have.

209. You have larger nets?—Yes, they are more than one-half larger than they used to be. Some of them have the length of 20 nets now in each coble. Formerly we never carried more than six.

210. The beam-trawlers from the south now compete with you off this coast?—Yes, they do.

211. They catch the white fish, I believe?—Yes.

212. And catch the white fish in very great numbers?—Yes, they catch great quantities in the trawl.

213. And I believe that you can see them fishing sometimes when your boats cannot go out?—Yes, they are constantly fishing. The weather must be coarse if they don't fish, because they are decked vessels, and can go to sea when open boats cannot go out at all.

214. Can you give any idea of the number of beam-trawls that fish off this coast?—Either on Tuesday or Wednesday last week, there were 22 fishing off this coast, and one day there were 28.

215. How long do they stay out? Do they fish all the year round?—There have been more this year than we have ever had before. When they first came here we used only to have a matter of three or four at a time.

216. Where do they mostly take their fish to?—I think they take them to Hartlepool and Sunderland mostly.

217. Do they catch the white fish; the haddock and cod you used to catch?—Yes.

218. Which of the white fish have you particularly noticed are declining?—We find that all the white fish are declining, and especially the haddock and cod. I know that the cod of late years have declined very greatly, because when I took the fish for the gentleman to whom I referred to send to Birmingham, I used to get 60 or 70 cod a day, and now when I go down to the beach I cannot get one at all.

219. Are you enabled to say whether the beam-trawlers catch cod in large quantities?—I do not know, but I believe that the trawls take all kinds of fish in.

220. Have you known men coming here and engaging themselves in the fishing trade who have not been natives of the place?—Yes, I believe there are a few who have married fishermen's daughters and such like. After they have married fishermen's daughters they generally commence the business here.

221. Then the increase of fishermen has not solely consisted of the children of fishermen?—Not of fishermen's sons in every case, but I believe that anybody that pleases to come can fish.

222. (*Mr. Caird.*) Do you know what quantity of herrings is caught in a season here?—No, I cannot say that I do. It is very uncertain.

223. But you know that the quantity has declined of late years?—Yes, it has declined very greatly.

224. But you do not know to what extent the herrings have declined?—No, I do not.

225. You do not know how many thousand less are caught now than used to be caught, say 20 or 30 years ago?—I do not know how many thousand, but there are many thousand less than used to be caught in my time, although we have twice the boats now, and there are more nets. Notwithstanding the larger boats and the greater quantity of nets we do not get the quantity of herrings we used to get in the small boats with less nets.

226. Has the season for herring-fishing upon this coast changed?—No.

227. Has it always been the case that the herrings come here in the middle of July and remain here until the end of September?—Yes.

228. And do they come here at any other time of the year?—No, they come at no other season; they come here in the middle of July and they remain here until the latter part of September.

229. (*Mr. Lefevre.*) I understand you to say that you think they spawn here?—Yes; we get them all full fish one night and the following night we get them all spawn fish.

230. And do you leave off fishing when you find them spawning?—No; as long as we can get any we keep up the fishing.

231. Do the fish sell as well when they have spawned?—No; they are not so good then.

The witness withdrew.

J. Templeman.

JAMES TEMPLEMAN called and examined.

232. (*Mr. Caird.*) Are you a native of this place?—No, I am not.

233. Are you a fisherman here?—Yes, I am a fisherman here.

234. Upon this coast?—I have been a master on this coast, and I have been fishing the herring-fishing for the last 25 years.

235. But you don't live here?—No, I live in South Shields.

236. Have you had a personal knowledge of the fishing on the coast during the last 25 years?—Yes, in every point, both with regard to trawling, lining, and herring-fishing likewise.

237. Have you found in the course of these 25 years that the quantity of fish caught here has diminished or increased?—I have found that in the last 10 years there has been a great decrease in the haddock-fishing, and also in the herring-fishing. It has even declined from here to the Dogger Bank, the Well Bank, the Whiting Bank, and what we call the "Silver Pits."

238. Has the decrease been great in cod and

whiting?—Yes; in cod, whiting, haddock, and ling. All these kinds of fish in the places I have mentioned have greatly declined.

239. And the decrease has chiefly been within the last 10 years?—Yes, chiefly within 10 years.

240. Has that decrease been principally in the size of the fish caught or in the quantity?—There has been a decrease both in the size and in the quantity of the fish. I have been master of a vessel trawling myself, and from experience I can give you some information upon the matter. We go away for about six hours, from tide to tide, and when we go six hours upon a stretch with the trawl we get all sorts of fish, big and small. We sort our fish, put those which are of the largest size on one side, and then we have to shovel overboard quite as much in bulk as we have left for the market. They have, however, been so much injured by the trawl that they are dead, and they are of no more use.

241. They are fish which are not worth taking to the market?—No, they are not worth taking to the market.

242. Do you say that the quantity of fish thrown overboard would amount to one half of the catch in the trawl?—Yes, more than one half what we get for the market. That is very often the case.

243. Then will it, upon the average, amount to half as much?—Generally so.

244. Then one half of the trawl is filled with unmarketable fish?—Yes, they will not look at them in the market.

245. And you say that they are dead when they are hauled up?—Yes, they are quite dead, and they are hove overboard. If we go for live plaice we haul up the trawl every two hours. We then get live ones, and throw the small ones overboard. I have seen an equal quantity. There is quite as much in bulk thrown overboard as we have had of marketable fish.

246. You say you have seen that?—Yes.

247. Then, was it an exceptional case?—No; it generally occurred every time the trawl was taken up. I should say that that is the general rule, and that is the cause why the Torbay fishermen have left Torbay and come here. When they first came off this coast from Torbay they came to Hull. They used then to trawl in the Big Silver Pit, a place I am as well acquainted with as with Cullercoats, and I have got as far as four, five, and six pads of fish. When these smacks first came to Silver Pits they used to get from 50 to 60 pads.

248. What is a pad?—A pad is a basket with a lid to it. Each pad will hold about 27 pairs of soles of fair size, and about 30 of a middle size.

249. Has the take increased or fallen off?—It has fallen off very much indeed. Our boats now go to the Silver Pits, and they cannot get three pads in a tide.

250. And how many did you say they used to get?—When the smacks first came to Hull and Grimsby they used to take from 50 to 60 pads. That was their original catch.

251. Then, in your opinion, there has been a great falling off in the quantity of fish taken off that coast of late years?—There has been a very great falling off of fish indeed. The destruction, both of fish and spawn, that is occasioned by the trawlers, is enormous. I have hove up myself three tons and a half of spawn of all sorts. I am not prepared to say that it was spawn of any particular kind, but I have had that quantity in my net myself.

252. You have had as much as that in one trawl-net in one haul?—Yes, in one haul.

253. Was that off this coast?—It was at a place we call the Smooth Ground, inside the Bank.

254. How many miles would it be from the shore? The bank, I think, is about 62 miles from the shore.

255. Do you refer to the Dogger Bank?—It will be about 60 miles within, inside the Dogger Bank, about 54 miles from the head.

256. Is that the line-fishing ground?—Yes.

257. And do your boats go that distance?—No; our line-boats do not, but the smacks go that distance off.

258. Then your boats do not go on the trawling-ground at all?—No, they do not go there; but last fall, when the herring season was about to close, I had occasion to go to Sunderland upon some business of my own, and while I was there I saw a smack come in, and lay in on the north shore. I saw the skipper of that smack, and I actually heard him offer a man at Sunderland about a ton and a half of spawn (I believe it was principally herring spawn) for sale.

259. What use could he make of it?—In this case it was offered for sale as manure. In addition to the spawn the smack had 20 scores of haddocks, 5 or 6 pads of soles, and a good many brill and turbot.

260. Was that spawn that you speak of purchased as manure?—No; the man to whom it was offered would not purchase it.

261. Have you ever seen it purchased?—No; I have only seen it offered, I never saw it purchased.

262. Are you aware of any boats that bring in spawn to sell as manure?—No, I cannot substantiate that; but in the case to which I refer, I saw the man offer it, although I did not see it purchased.

263. Did you ever see any other case than that, or was that the only one?—That was the only one.

264. You never saw spawn offered for sale as manure, in any other case?—No, but I have seen large quantities of spawn taken up in our trawl-nets.

265. Is it in any particular season that the spawn is so taken up?—It is generally in the latter part of September and in the beginning of October that we get such heavy hauls of it.

266. Is that the best fishing season?—Yes, it is the best fishing season for the trawlers. Large quantities of fish accumulate about the spawn, and the trawlers work about and get the fish. They don't like, however, to haul up the spawn, as it gives them much trouble to heave it up.

267. Have you ever known the spawn drawn up except during that season?—During the time that haddock spawning is going on you will get haddock spawn in your nets just in the same manner.

268. Can you tell what is the time for haddock spawning?—February and March.

269. Is there any other time during the trawl-fishing when the spawn can be taken up except the periods you have mentioned?—Yes; the herring spawn can be taken up now. There (*pointing to the sea*) is a smack trawling out there now, and I warrant ye that he will get a good lot of it.

270. Is there any particular period when the spawn is liable to be broken up and carried to the surface of the water?—The fish deposit the spawn at the bottom of the sea, and the trawls in passing over it are productive of a great amount of evil to the spawn of the fish.

271. Have you been engaged during the whole of a season upon a trawling boat?—Not altogether in trawling. We used to trawl during a certain season, and then we went codding.

272. Were you ever for the whole season engaged in trawling?—No, not for a whole season.

273. Then you cannot tell us whether for a whole season you got spawn in your nets?—No, but a person whom I engaged told me so, and I said that if what he told me was true, the fish would soon be all cleared out.

274. Is the Dogger Bank about 60 miles from the shore?—I believe it is about that distance from Flamborough Head.

275. Do the smacks trawl upon the Dogger Bank?—Yes, upon the Dogger Bank and upon the Well Bank, and upon the Whiting Bank.

276. How long have they been there?—They have been there a long time now.

277. (*Mr. Lefevre.*) Will you give me the name of all the Banks off this coast upon which they trawl?—There is the Dogger Bank, the Whiting Bank, and the Haddock Bank. That bears east from the Humber about 22 miles. The Whiting Bank is just outside that.

CULLER-COATS.

J. Templeman.

22 Sept. 1863.

278. (*Mr. Caird.*) Have you ever seen as many as 50 trawlers engaged in trawling together on the Dogger Bank?—Yes, I have.

279. How many years has that continued within your own knowledge?—It has gone on within my knowledge during the last 10 years.

280. Has the take of fish declined greatly this year?—Yes, it has declined very much on the Dogger Bank. Not one quarter part can they catch now as compared with what they used to catch.

281. In making that statement, do you speak from your personal knowledge?—Yes, from my personal knowledge, both with regard to haddock, cod, brill, and all sorts of fishing.

282. Do you know whether the number of trawl-boats on the Dogger Bank, is increasing?—They have increased within these last few years 10 per cent.

283. They are one-tenth more than they were previously?—Yes, quite that.

284. And yet you say they are getting one-fourth less fish?—Yes.

285. Then they must be making a very bad business of it?—Yes; some of them have been seriously affected. They have made a very bad living of it. They have impoverished all the places they used to fish, and now they have come to impoverish the ground here. The consequence will be that in a very few years there will be no fish here, either herring, haddock, cod, brill, or any other fish.

286. You were speaking of the Whiting Bank, does your answer apply to that?—I have shot my nets there, and have got 10 score of beautiful cod in them. The trawlers have been over them since, and I have often shot seven nets and have only got three score.

287. Do you attribute that falling off to the trawlers coming there and sweeping up the fish?—Yes, they take everything before them; even if there are any stones in their way they take them up.

288. Is it the same with respect to the other banks to which you have referred—the Haddock Bank and the Silver Pits. Do you suppose that the quantity of fish in those places is decreasing in the same way?—Yes. That is what is driving them to this place. This coast was not much frequented by trawlers until within the last five or six years. They used to come up to Hartlepool in the summer time; but most of the trawlers used to go to Iceland for salt fishing. Now they keep their trawlers here because they can make a good deal more money; they can make 4*l.* or 5*l.* a day trawling here, and that pays expenses very well. But the result has been that they have destroyed the fish at Hartlepool and Sunderland. Those fishing-grounds are ruined altogether, and now they have come to the small patch of fishing-ground that lies off here, and they are sweeping it as clean as can be. In a very short time, if this trawling is allowed to go on, fishing here will not be worth calling fishing.

289. How far from the coast do they fish?—About five miles and a-half or six miles, in 32 fathoms of water. They generally commence in about 22½ fathoms. Outside that all is mud, and there is nothing to catch.

290. Is that the ground upon which the line-fishermen here go?—Yes, it is the ground upon which they fish for a living.

291. And I understand you to say that they now find it very much interfered with by these trawl-fishermen coming in there?—Yes, undoubtedly. They go as far as Souter Point, and if they get a westerly wind with an ebb tide they sweep it clean. They go over it again with the flood. I counted 28 one day off this place. Their beams would be from 34 to 35 feet in length. They would soon scour the whole patch of ground clean, for it is only about four miles broad.

292. (*Mr. Lefevre.*) What is four miles broad?—The ground the trawlers run over where they get the principal part of their haddocks. In point of fact, they can only get them here because all the rest is hard ground.

293. How far off is that ground?—About six miles.

294. How many men are there in these vessels that you speak of?—Three men and a boy.

295. How many men are there in your boats?—Three men and a boy.

296. What weight of fish will a trawl-boat catch in the course of a day?—Why, some of them will catch 10 cwt. of fish in a day.

297. Will they get that quantity of marketable fish?—Yes, of marketable fish.

298. And they will obtain that by the labours of three men and a boy?—Yes.

299. And what weight of fish will a line-fisher catch in the same time?—They consider themselves to do very well if they get four or five stone in a boat.

300. Five stone as compared with 10 cwt.?—Yes.

301. Is that the same kind of fish?—Yes.

302. And equally marketable fish?—Yes. The line will not take fish which are not marketable. They may get a few small ones occasionally, but nothing as compared with what the trawlers get.

303. Are the fish caught by the trawlers in as good a condition for the market as those which are caught by the line?—No, their insides are all broken and burst, and the gall is spilt upon them.

304. Can you tell me whether the fish caught by the trawl would fetch a lower price in consequence of the deterioration of quality?—Yes, they fetch a very inferior price. They have to take the gut out of them as soon as they catch them, while the fish caught by the fishermen here are taken into the market in a fresh state.

305. What would you, as a practical fisherman, do if you had the power and desired to effect an alteration in the matter in order to restore line-fishing—what legislation would you adopt?—I would pass an Act of Parliament to do away with trawling, and I would substitute line-fishing in its place.

306. Would you oblige a man to fish in a certain way?—Yes, I would oblige a man to fish with hooks and lines.

307. Do you think that the effect of establishing such a regulation would be to increase the supply of fish for the consumption of the country generally?—Undoubtedly it would. The young fish would not then be taken. They would not take the hook, and they would be allowed to come to maturity before they were caught.

308. Is it not your opinion that if you were to do away with 10 cwt. of fish, and put only 5 stone in its place, that you might decrease the supply to the market?—No, I don't think there would be any decrease whatever. The supply would be generally large, because, at present one-half of the fish that the trawlers catch they are compelled to heave overboard.

309. But I understood you to say that about 10 cwt. was marketable fish?—Yes, but if they have calm weather the boats cannot get to the shore so rapidly as they could wish with their fish. The consequence is that when the fish comes in it is not in a fresh state, and is not fit for the market, whereas the men with the boats who fish with the long lines can always get to the shore and bring in their fish.

310. Yes, but the long-line fisher is fishing 5 miles off instead of 50?—That is one reason why the difference takes place. When the weather is calm, if the trawler hauls up he has no wind and finds he cannot get to the shore.

311. If you were to limit yourself to 5 miles distance surely you would not be able to catch as many fish as you would if you extended the limit to 50 miles?—No, that is true; but what I say is this: If this trawling is to be permitted in British waters there will soon be that decrease in the quantity of fish that there will be none for the market at all.

312. Is there any law or any restriction imposed by

CULLER-COATS.

J. Templeman.

22 Sept. 1863.

the law which, in your opinion, injuriously affects you as a fisherman?—Yes, there is, and I mean to say it is a very bad one too.

313. What law is it that you refer to?—It is that which at the present time permits the Frenchmen to approach too nigh our coasts. The consequence of allowing them to come so near is that they deprive us of our living. They fish with herring-nets much heavier than ours and we dare not go near them. What with the Frenchmen and the trawlers we can scarcely pick up a living, whereas before they came here we were able to catch plenty of herrings. At that time we only got 15*d.* per 100 for the fish, but we could make a better season with that low price than we can make now when we get 2*s.* 6*d.* per 100 for them.

314. What kind of fish do the Frenchmen fish for?—Herring.

316. Do they fish with the same sort of nets as yours?—No, they are not like ours.

317. Are they better nets than yours?—They are considerably heavier.

318. But are they better adapted for catching fish?—We cannot compete with them. They can heave their nets faster than we can do.

319. Are they more active men than you?—No, but they have a capstan and 20 or 30 men upon each boat. They can work their capstan at such a speed that almost at one turn they will heave a vessel far ahead. In that way they have a considerable advantage over the fishermen who are working in the cobles.

320. Then I understand that they are superior to you in the use of machinery?—The reason they do us so much damage is simply this, the law of England permits them to come in among the small boats and take away our fish from us. That is exactly the grievance we have.

321. Do they come in within the limits prescribed by the law?—The law says that they are to keep three miles off, but they come within two miles and a mile, and shoot their nets. They shoot their nets wherever we shoot ours.

322. And is it in consequence of that that they take the herrings that would otherwise be caught by the fishermen in shore?—Yes.

323. Do the Frenchmen come here in large numbers?—Two or three French fleets of enormous length will go among a shoal of herrings.

324. What is a fleet?—I mean a fleet of nets.

325. What length will a fleet of nets be?—Perhaps will be 200 or 150 nets, as the case may be. The French will go in with nets like that among a shoal of herrings. Perhaps 10 Frenchmen may go in. The consequence is that they cut the shoal up, and the fish take off.

326. Then they fish with larger nets than you are in the habit of using?—Yes.

327. Is that in consequence of the larger size of their boats?—Yes; if they had not larger boats they would draw near the land, and catch no fish at all.

328. If you employed larger nets, could you not catch more fish?—No; we have nets in proportion to our boats.

329. The nets then must be regulated by the size of the boats?—Yes; but I may add that many fishermen have larger nets than they have a right to use according to the size of their boats.

330. When you spoke of a fleet of nets, how many French fishing boats would they belong to?—I have seen 30 or 40 boats fishing off here at a time.

331. Were they fishing off here during the time that you were fishing?—Yes, they were fishing off here during the whole of the time there were any herrings to catch. Then as soon as they found there were none to catch, they were off. As long as the herring was here, the Frenchman was here, and when the herring went away, he went away; I have seen their nets upon the shore in Blyth Bay.

332. (*Professor Huxley.*) But that is illegal, is it not?—I know it is.

333. (*Mr. Caird.*) Did nobody object to it?—No, not one. If we do object, there is no one to take notice of us.

334. Is there not a fishery vessel employed here?—Yes, I believe there is, but she is good deal more often in harbour than on her own post.

335. Have you never made complaints?—Once I had a net destroyed by a Frenchman. The gun boat fetched him on board, and I got a small remuneration, but nothing in comparison with what I had lost. As a general rule the fishery boat is to be found nowhere except at Shields, Sunderland, or Holy Island. A fisherman had his back broken by a Frenchman not very long ago because he wanted to take his number.

336. Practically you say that of all the herrings caught off this coast, the French take one half?—Yes, I should say the French take two-thirds, and leave one-third for us.

337. And is that within the limit of three miles from the shore?—Not always. If you were fishing here close in shore they would come in alongside of you if they thought there was anything to be got by it.

338. Do they take the fish they catch to France?—Yes, they salt them, and they get a premium for every first-rate cargo of fish taken to France, and they have a French steam boat here to take them very quickly.

339. Do you think that any legislative provision could be made to prevent the Frenchmen from getting so large a share of the fish on the Englishman's ground?—Yes, there ought to have been a law made long since. I am glad you have taken notice of it, and I hope you will do something in the matter.

340. Is that the only ground of complaint you have to make?—No; there is the point of trawling. That I think ought to be abolished entirely if we want our fishing to exist. I speak of the white fishing—haddock, ling, skate, sole, and so on. If that is to go on at all, trawling must be done away with. As to trawling in shore, I don't think much harm arises from that; the meshes of the nets are much larger than those which are used by the big trawls.

341. Have you ever been engaged in trawl-fishing for soles near the shore?—No, I have not been engaged personally.

342. Are there any oysters caught off this coast?—No, I think there are no oyster beds off here.

343. Have you ever fished here for lobsters?—Yes, I have fished both for crabs and lobsters in one year.

344. Do you find that the supply of crabs and lobsters is increasing or diminishing?—They are decreasing very greatly. We can get but few now.

345. They are not upon the ground which is fished over by the trawls, are they?—No, they are upon the rocks.

346. Can you tell us what is the reason of the decrease?—No, I cannot say. I have often thought about the matter. I cannot say whether the suggestion is true; but I believe there is a great quantity of nuisance imported from the Tyne into the water; the refuse of alkali, for instance, finds its way into the sea, and I believe that it is very destructive to white fish. It is taken out from the Tyne and deposited in between 14 and 15 fathoms of water.

347. How long is that ago?—Why it is going on at the present day.

348. And do they continue to take out that refuse now?—Yes, I believe they do, and they throw it out in 14 fathoms of water, even so low as 10 fathoms sometimes.

349. Do you partly attribute the destruction of fish to that?—Yes, especially with regard to the shell-fish.

350. Is it shell-fish alone that it destroys?—Yes, it does most damage to them. I believe it has destroyed them greatly.

351. Are there not as many shell-fish here as there used to be?—No; in former years I have in one day got as many as from two to three scores of nice saleable lobsters the proper length for taking to market; but for the last year or two there has been very little to catch.

CULLER-COATS.

J. Templeman.

22 Sept. 1863.

352. (*Professor Huxley.*) You are a long-line fisherman, I believe?—Yes.

353. And you have done a good deal in that way?—Yes.

354. What is the length of line that you commonly use here?—Four fathoms go to a half piece; there are two of them to a piece; six of them in a line, sometimes only five.

355. How many snoods are there on a line?—Some have two fathoms only in a piece.

356. How many hundred hooks are there on a line?—There are 1,500 or 1,600, but I should say there are 1,000 on the average.

357. How many lines have you in a boat when you are white fishing?—Every man has one. In Scotland I believe every man has two.

358. You bait them and lay them out?—Yes.

359. How many fish did you get in former years?—When I was a young lad I have seen us get as many as 50 score on a line.

360. That would be a fish upon every hook?—No; I mean upon two lines. I have seen 250 score got in a boat.

361. That would be with two lines each in a boat?—Yes.

362. (*Mr. Lefevre.*) You say you have seen 50 score caught in a boat?—Yes, upon two lines. I have often seen 50 score upon two lines.

363. (*Professor Huxley.*) That is a fish for every other hook?—Yes, about that.

364. Do you commonly get all the fish that have been caught on your hooks; do not the dog-fish destroy a great number?—Yes, the dogs take a good many from us. They will eat them very fast, and pick the bones too.

365. I believe that sometimes you get only the head of the fish on the hook?—I do not know that I have brought up the lines with only the heads upon the hooks, but I brought them up with the fish very much eaten sometimes.

366. Then sometimes a large proportion of the fish brought up on the lines will be damaged, destroyed, or unsaleable?—Yes, by dog-fish and suckers.

367. I suppose that sometimes a whole night's fishing or the larger part of it is ruined?—That is generally the case when the dogs are on the coast. We commence hauling at the other end whenever we know the dogs are about, and we don't give them time to eat the fish. But if we let the lines lie in the water the dogs will commence eating the fish off the hooks as they are lying in, and very often they will take away the snood too.

368. Then a good deal of fish is wasted in that way?—Yes, a good deal.

369. You were speaking just now of bringing up large quantities of spawn. Now is it not the case that fishermen call many different things spawn?—No; practice makes perfect. A man who has been much engaged in fishing soon knows spawn from anything else.

370. Then I suppose you know what spawn is?—Yes, I do.

371. Now I have been a sailor in my time and I have heard sailors call all sorts of things spawn. I daresay you have too?—Yes; but when you are going along with a trawl and you take spawn up, if you examine it with a glass you will soon see that there is life in it. I have a large glass at home and I have examined various things with it which I have got at the sea bottom, and I have seen spawn with actual life in it. There is a sort of skin over it. It is very hard, and you would be surprised at the impression it would take to remove that skin. But I believe that when it is once removed the spawn becomes dead.

372. Have you ever seen any herring-spawn?—Yes.

373. If ever you have taken herring-spawn and placed it in a bucket and let it remain there for a short time, the spawn will get set to the bottom so that you can hardly scrape it off?—Yes, I am aware of that.

374. Well, that fact will show you that fish spawn adheres very firmly to the bottom?—Yes. Whelk-spawn adheres to the rock, I believe. The spawn of ling is generally deposited in the mud.

375. In trawling with the beam-trawl, you have the beam about 30 or 40 feet long?—Yes, 37 feet long.

376. At each end there is, I believe, a large thing made of iron, like a crutch?—Yes, they are the heads.

377. And the mouth of the net is upon that?—Yes.

378. And it is made fast to the heads and you haul it astern?—Yes.

379. Can you tell me what is the use of the heads?—Yes, it is to keep the trawl off the ground.

380. It keeps the beam to a certain extent from the ground?—Yes.

381. Then the beam does not absolutely touch the ground?—No, it is about $2\frac{1}{2}$ or 3 feet above the ground.

382. So that the fish are caught in it by being disturbed, and they run into the net as the vessel sweeps along?—Yes; if you give a vessel good way and heave a good press of canvas on her, and give a good deal of rope, then your trawlheads will come quite down, level with the ground; but if you let your vessel lie dormant while you are shooting the trawl net, the net will likely turn upside down. If you carry a press of sail the trawl goes down because it is of great weight.

383. I suppose there is something attached to the beam to keep it from going upon the ground?—Yes, there are trawl heads.

384. How many knots an hour do you drift?—Generally about three, allowing the ebb to take us a knot and a half. If we go faster than that, we call it 'swimming the trawl,' and we get nothing but haddocks then.

385. Have you ever been out oyster dredging?—No, I never went oyster dredging.

386. If you make a knot an hour, it is the outside?—Yes.

387. I suppose the dredge bites the ground?—Yes.

388. (*Mr. Lefevre.*) Do you take the trawl against the tide?—No, we work it with the tide.

389. (*Professor Huxley.*) Would it not be impossible to drift your trawl at the rate of 3 knots an hour, if you bit the ground?—No, we could not do it.

390. The beam is round, I believe?—Some are made of oak and of ash, and they are very crooked.

391. But they are round, like the barrel of a quill?—Yes.

392. I perceive it is your object to have the least possible bite upon the ground?—Yes, as long as we keep it to the bottom of the ground, that is all that is required.

393. Have you ever seen any large stones brought up in a trawl?—Yes, I have seen very big ones, and we have been very glad to get them up in sight, so that we could cut a hole in the net and get clear of them. The ground rope of the trawl is made in four pieces. Then there is a chain, the same as in a mackerel-net. They are then welded with a large piece of rope. If we catch a rock with that the ground-rope may break, and yet you will not lose the whole of your net. You may split your ground-rope, but still save your net.

394. Then the weight of a ground-rope acts as a scraper to a certain extent?—Yes.

395. You stated that you had seen large quantities of spawn brought up in that way?—Yes, I once saw 3 tons brought up.

396. What was done with it?—We hove it overboard as soon as we got it. I cannot tell how long it had been in the trawl; it might have got in six, or 11 or 12 hours before.

397. Then you are quite of opinion that the trawling does bring up a considerable quantity of spawn on the average?—Yes, it brings up large quantities. I should say that the trawl is very destructive to spawn.

398. Have you any reason to believe that all that spawn is dead when it goes back?—Yes, I think it is quite dead.

399. Why do you think it is dead?—I think it is because it is so much jumbled together, and the skin is so much broken.

400. But a friend of mine had some herring spawn dredged up, about two years ago. He took it home and examined it, and found it all alive?—That is quite possible, but it would have been according to the time it might have been dredged along with the trawl. The trawl might not have been in long enough to have done much damage; but if you get an immense weight of fish in the trawl, and also a large quantity of spawn, I imagine you may have 6 or 7 tons in the trawl at one time. You have to heave it all up. You have then to get hold of the bag and take it forward to the windlass and heave that tight. That operation cuts through a certain portion of the fish. You have then another rope which you call the cod-end rope. You put it on a break and heave it up. You shake it out, make the ends fast again and run it out and heave it. You do that five or six or seven times, until you get your nets cleared.

401. So that you consider the spawn is a good deal bruised in getting the contents of the trawl nets into the boat?—They will often get haddock and other fish quite cut through.

402. Do you get fish in large quantities in the trawl?—Yes, in very large quantities sometimes. Upon the Dogger Bank I have occasionally made one haul, and it has been so large that I have come straight home with it.

403. Do not the flat-fish feed a good deal upon spawn?—I do not think they do.

404. Why do you arrive at that opinion?—Because when the spawn is upon the ground I am convinced it can hardly be broken by the mouth of a flat-fish. A flat-fish has not sufficient power in its jaw to do that.

405. Have you ever been informed by those who have obtained flat-fish and cod and the like, that their stomachs are found full of spawn?—I have seen spawn in the whiting.

406. Have you ever found a turbot full of spawn?—No; I have found haddock and whiting in his maw, but no spawn.

407. Then I may tell you that there have been flat-fish sometimes found with 2 or 3 pounds of spawn in them?—I never knew such a case. I once caught a halibut weighing 14½ lbs. and he had a cod in his mouth, but I never found any with spawn in them. I believe that the whiting destroys a great deal of spawn. They have got long teeth, and they can tear it to pieces. They are as injurious to spawn as any fish with which I am acquainted; they have, as I said, such powerful teeth.

408. Do you know when the whiting spawns?—Yes, I believe they spawn about the same time as haddocks.

409. When is that?—In the months of February and March, and then they commence being good in May again. That is the time for whiting, haddock, and ling, but the ling is a little later in spawning than the haddock.

410. Then would it meet your views if trawling was prohibited during the time that fish are spawning?—If trawling were prohibited here, and upon the coast altogether, I believe it would tend materially to increase the number of fish.

411. What I speak of is this; would your views be met by prohibiting trawling at the time the spawn of haddock and other fish is on the ground?—I believe it would be very beneficial.

412. I do not understand you to mean that trawling does any harm when the spawn is not upon the ground?—Oh yes, it does; it must do harm when it takes all the small fish in. I have seen one half of the catch taken out and thrown overboard, and of course as they were dead they never came to life again.

413. Why were they thrown overboard?—They were thrown overboard because they were so small that they were not fit for the market.

414. Then there is a second objection. If there were only the objection that the trawling takes the spawn you might put a stop to that by prohibiting trawling when the spawn is upon the ground. Now with regard to the second objection, could it be met by the mesh of the trawl being fixed at any particular size?—It might, but who is to attend to it?

415. You know what has been done with regard to herring-nets; if the herring-nets are not 36 meshes to the yard they may be seized and forfeited?—I have nets with 33 meshes to the yard, and that is a long way from that. I have been in Scotland and have had them examined. They have told me that the meshes were very small, but the men who examined them never said—put them out.

416. We will put aside for a moment the practicability of carrying out the law. Suppose that it was well carried out, do you think it possible to make the mesh sufficiently large to permit the small fish to pass through and not be destroyed?—You might do so to a certain extent, but when the vessel is going at the rate I mentioned I cannot help thinking that it would very materially injure the small fish. How are they to get out through a large body of fish such as you often have in a trawl? They cannot press their way through such a body of fish. There are only two egresses, one on each side; there is none at the bottom. I am not at all prepared to say that the small fish would go out at the sides of the trawl.

417. Do you not think that a limit might be fixed with regard to the mesh which would meet the necessities of the case?—I do not think that would remedy the evil. I have seen the trawl worked, and I have got one up when it had only gone a short distance and I have found it choke-full. I think if the small fish once get in the pressure of water alone would keep them in. They would not be able to get out. I cannot see how they would get out.

418. Then you do not see any way in which trawling can be legalized so as to make it otherwise than injurious to line-fishing?—It should be abolished from the coast altogether, but if it is to be permitted at certain times, limits should be assigned to the trawlers, and yet if that were done there is nobody to keep them within their limits. If such a law were made perhaps they would keep to their limits for a month, and then they would soon come back again.

419. But suppose they could be kept within limits, what limit do you think would be advisable?—I can hardly say. For my part I think they ought to be kept 12 miles outside the Dogger Bank, and if they got no fish there they would go somewhere else.

420. (*Mr. Lefevre.*) Why, that is 60 miles away?—It is 130 miles from here. The Dogger Bank east of this place is more than 30 miles wide. It is about 130 from here off the shore. In my opinion trawling is fast impoverishing the British fishing-waters. It is impoverishing them so rapidly that in a very short period of time, according to my judgment as a fisherman, they will render fishing extinct altogether in the shape of long-line fishing. They have destroyed the Channel fishing entirely. There was a beautiful place at Torbay. They have destroyed that, and now they are destroying the Silver Pit. They cannot make a living there and they come here. If they could get plenty of fish in the Silver Pit they would not come here, because they would have a far better market in the Humber than they have here. At the present time I believe they are going down as far as Scotland.

421. (*Professor Huxley.*) Do the trawlers do you any harm by under-selling you in the market?—Yes; we cannot compete with them. We have three men and a boy who catch so many fish, but the trawlers catch a much larger quantity, and having so large a quantity to sell, we cannot compete with them.

422. The trawlers catch the larger quantity of fish, you say?—Yes, a very much larger quantity.

423. (*Mr. Caird.*) I think the proportion you stated

CULLER-COATS.

J. Templeman.

22 Sept. 1863.

was 5 stone to 10 cwt.?—Yes; what I mean is that in line-fishing we cannot compete with them at all.

424. (*Professor Huxley.*) I presume that you cannot compete with the French boats? Their boats are larger and better boats, are they not?—Yes, they are much larger and heavier than ours.

425. Then why do you not set up bigger boats here?—We cannot do so, because the British Government do not uphold our fisheries like the French Government do theirs.

426. Do the French Government uphold their fisheries?—Yes; they give a large premium for a good cargo of fish; half of the premium so given is set aside and goes to make a fund from which, when a vessel has been 10 or 12 years in the fishery, a new one is supplied. The old one is taken away from the place altogether, the new one is sent in her room, and the premium goes towards paying for it, so that the fishermen themselves are never asked to contribute one farthing towards the expenses of their boats. Now, on the other hand, we are obliged, if we want a new boat, to put our hands into our pockets and pay for it, and of course if we had bigger boats it would be a great advantage to us. With bigger vessels we could prosecute the fishing during the course of the winter. There are some men here who have been constantly at the herring-fishing, and they will tell you that, if they had suitable vessels, they would be able to do much more than they can do at present.

427. What I understand you to say is that the purse of the Government backs the Frenchman, while in this country it does not back the Englishman?—Yes; it certainly does not back the Englishman in the same way as the French Government back their men.

428. But they might back the English fishermen by sending out gunboats to protect them?—Yes, that might be done, but I am sorry to say that those in command of those boats do not do do their duty. We petitioned some time ago for some gunboats to be sent down, and they were sent down in reply to our petition, and did their duty with great vigour for a short time. That is now some time ago, but since then the work has been greatly neglected. I think I have seen one gunboat in Shields this year, but when the Frenchmen have been off the coast breaking the law, there has not been one to be found.

429. Is it not the law that no French vessel shall fish within 3 miles of the coast?—Any French vessel found within that limit can be prosecuted?—Yes, I am perfectly aware that that is the law.

430. Then if that law were strictly enforced do you think that it would give you constant protection against the French?—We should have protection this way; if the herring were lying four miles within the coast, then the Frenchmen would be three miles outside of us again. The captain of a man-of-war who was once in command on this coast told us that the distance was to be measured from headland to headland; that they were to be three miles outside of a straight line drawn between such points. Now, if a parallel line were drawn from Foulness to Peterhead, then the French would be three miles outside of it. If a Frenchman got within that distance he would be seized and fined. The captain to whom I allude said, "That is my code of rules." He added, "I therefore take the parallel of any two heads I may think proper, and if I catch a Frenchman inside the three-mile limit then I can fine him."

431. The French fishing boats can be interfered with and fined if they are within three miles, which is the limit laid down by the law?—Yes; we just want the French to be clear of us; we do not want the bread to be taken out of our mouths altogether.

432. You cannot expect protection in every case in which you may desire it?—All that we want is that a gunboat should be stationed off the coast, and should see that everything is properly attended to.

433. Do you want the French to be three miles outside every shoal of herrings wherever it may be?—No; I cannot say that we want that, but what we want is that they shall not interfere with us in our fishing.

434. Wherever a shoal of herrings makes its appearance within your reach, perhaps at a distance of 10 miles off the coast, what you want is that a gunboat should be employed to keep the French three miles outside of that?—We do not want them to be allowed to come amongst us. I know that if a French vessel catches an English vessel half-Channel over, within their limits, that is to say, if they catch the English vessel within their limits of half the Channel, they will take her to France and not allow her to go out again until the fishing season is over. I have seen that done myself.

435. (*Mr. Lefevre.*) I think, Templeman, you said that you were on board a trawling boat yourself for some time?—Yes; I have been the master of a trawling boat.

436. For how long were you so employed?—I belonged to her for three years.

437. Where did you fish?—We fished upon the Dogger Bank, the Well Bank, and upon the Whiting Bank, and I have also fished off here.

438. How far did you generally fish off this coast?—I once had a haul within about six miles of this coast. I think that that was about all.

439. How long ago was that?—It would be about four years ago.

440. Then I suppose that you left trawl-fishing to come back to the fishing in which you are now engaged?—No, I did not leave it; the vessel was sold, and then I came back to long-line fishing.

441. Then practically you did come back to this fishing?—Yes, I did.

442. Will you be kind enough to inform me what your earnings were; your average earnings on board a trawl-boat?—I was paid by the week, and not by a share.

443. What did you earn in a trawl-boat as compared with what you earn now?—I earn more now than I did then; my wages were 12*s.* a week and poundage.

445. Was the trawl-boat provided by a company?—Yes, by a firm.

446. And now you have got your own boat here? Yes.

447. And you say that you make here more than you did when you were employed as a trawler?—Yes; because the whole gear in the boat I use now is my own.

448. You say that the Dogger Bank extends above here in this direction?—Yes; part of it will be about 60 miles from Flamborough Head.

449. Do the line-fishermen go as far out as that to fish?—The line-fishermen do not go out as far as that with their small boats.

450. But the trawl-boats fish off there?—They go into, I should say, 25 fathoms of water. They go right away to the other side of the bank.

451. I understood you to say that there was a channel about six miles, or probably about five miles from this coast where they also come in their trawls?—There is a piece of ground there called the 'smooth ground' or the 'hard edge,' which runs to about 30 fathoms, and I have seen the trawls all the herring season upon that piece of ground.

542. Is the width of that piece of ground from four to five miles?—Not quite so much, it is only about three or four miles.

453. Then I take it that, between that piece of ground and the coast, there is a considerable space of ground upon which the line-fishermen can work?—Yes, there is.

454. And they can work beyond that also?—Yes.

455. Where the trawlers cannot work?—Yes.

456. In that channel do they get most of the fish which they take?—Yes, that is the place where the Cullercoats fisherman principally get their living.

457. Is it there that the fish spawn?—Yes.

458. What kinds of fish spawn there in particular?—Haddocks.

459. Do the herrings spawn there?—No, I think they come further in shore to spawn.

460. Then the trawlers do not interfere with the herring spawn?—The smooth ground to the southward of the Souter runs closer in there than it does here. All that I know is that where a large shoal of herrings spawn the smack goes directly over.

461. I understood you to say that there was a bank six miles broad, on which the men cannot use their trawls, and where the herring spawn?—The trawlers trawl anywhere.

462. But I thought you said that they could not trawl upon the rough ground?—As a general rule they use their trawl anywhere,

463. But as a general rule they confine themselves to the smooth ground, do they not?—Yes, as much as possible.

464. And they keep some six miles off from here?—Yes.

465. And the herring come in within that distance, and spawn within that distance?—Yes.

466. Then I take it that, as a general rule, the trawling does not interfere with the spawn of the herring?—No; perhaps it does not interfere so much with the herring spawn as it does with the spawn of other fish.

467. Now, as a practical fisherman, I would ask you another question. Do you consider that there has been a great diminution in the herring fishery here?—Yes, I think it has fallen off a very great deal.

468. Do you mean that there has been an absolute diminution of the whole quantity caught, or that each boat has caught less than each boat formerly caught?—I think there has been a decrease in the whole quantity caught.

469. Do you attribute that to the trawling?—I believe that that is one cause of the decrease; but I believe also that allowing the Frenchmen with a large number of nets there to fish, is another, and perhaps the greatest cause of the falling off.

470. Can you tell me whether the number of French fishing boats has increased of late years?—Yes, it has increased more than 10 per cent.

471. Within the last how many years has that increase taken place?—I should say that it has increased as much as that within the last 10 years.

472. Do the French fishing boats use larger nets, now, than they used to do?—Yes, they use much larger vessels, and a greater number of nets.

473. Do they catch more fish now than they used to do?—They catch a much larger quantity of fish.

474. Do they catch now more than they did 10 years ago?—Well, I think they do. I have seen some of them load their vessels in two hauls.

475. Do you consider that the diminution in the catch of fish is owing, mainly, to the French fishermen, or to the use of trawls?—In my opinion it is owing to both.

476. Do the French ever use the trawl?—No, they only use the net, and do not fish for white fish at all.

477. What I mean is, do they not ever catch haddock, cod, and ling?—No, I believe that they do further south, but they do not off this coast. I have been told that they have been off the coast of Ramsgate, and there have been great complaints of the destruction committed by the French fishermen there. Large quantities of fish are taken by the Frenchmen off that coast. I have myself seen 40 Frenchmen trawling at a time off Ramsgate.

478. Can you say whether the French fishing interferes with the catch of haddock, cod, or ling?—No, I cannot.

479. Then the diminution in the take of those fish you consider to be owing to the trawlers?—Yes, they have diminished the haddock, cod, and ling, the skate, the halibut, and such like. They have diminished that description of fishing more than 15 per cent.

480. Taking into consideration the quantity of herring caught by the French, should you say that there is a diminution in the number of fish caught here?—Yes; we have never had such fish of late years as we used to have here; the number of French boats has increased so largely that wherever there is any fishing near us they always come in, and we cannot get a place among them.

481. Do you think that, having regard to the quantity of fish caught by the French, the absolute quantity caught off this coast has increased or not?—I think it has decreased, and the Frenchmen are the probable cause of the decrease. They sweep the whole sea, and we have no chance.

482. Then you cannot say whether the quantity caught altogether by Frenchmen and Englishmen has increased or not?—The French take nearly all; you cannot compete with them; they get quite round the shoals, and if you put your nets in you will soon find the Frenchmen heaving them aboard, and if you go near them to ask them what they are doing with your nets they will break your head with an oar.

483. How far do your line-boats go out to fish with the line from Cullercoats?—In the summer time, during the time that the long-line fishing lasts, they will go away in the morning and sail six or seven hours before they set their lines. Perhaps in that time they will go 22 or 23 or 24 miles.

484. I suppose that in bad weather they will not go so far as that?—No, not in coarse weather.

485. In bad weather do they see the trawls coming nearly in shore?—Yes. They have altogether impoverished that ground. That place is now swept literally clean, the same as if a man had been sweeping a house with a besom.

486. Have you seen any of the trawlers still fishing here?—Yes, I have.

487. Do they continue to make large catches of fish?—No; but I have seen them come into Shields with 52 baskets of fish. They have inquired if I would purchase any fish of them. I asked them, for curiosity, how much they had got, they said they had 52 baskets; then I told them to go somewhere else with them. I looked at them, but would have nothing to do with them at all.

488. Was that in consequence of their being so much damaged with the trawl that you declined to purchase them?—Yes; they were very much injured; they had no scales on them, and they looked as if they had been washed about in the sea for a week; many of them had no fins.

489. Then, was it because they were damaged or because you had a disinclination to buy fish from the trawlers that you declined to take them?—Well, I never buy from trawlers.

490. I understood you to say that the trawling boats go to the Dogger Bank because there is a great accumulation of fish there about the time of spawning?—Yes, they accumulate there to spawn.

491. They are not attracted by the spawn of other fish?—No, I think not.

492. Then you are of opinion that they do not go there to feed on the spawn of other fish?—I do not think they do.

493. Can you tell me whether the herring spawn there?—I believe that they are about to commence going on that ground in order to fish for herrings.

494. I think you said that there had been a great increase in the number of trawls on this part of the coast?—Yes, there has been a very great increase.

495. Are you sure that they have deserted the ground further south?—Yes; there were plenty of fish there some time ago; but there are none there now.

496. Do you think there has been a diminution of trawlers further south?—Undoubtedly there has; they used to come down here six or seven years ago after they had been fishing on the south ground, but now you will not see them on the south ground at all, because they have entirely cleaned it out. They are trawling at the present time as far north as St. Andrew's Bay, in Fifeshire.

497. Do you think it would not answer to trawl

CULLERCOATS.

J. Templeman.

22 Sept. 1863.

from here?—No, I believe it would not answer the fishermen to trawl from here.

498. Why not. Would it require larger boats?—No, it is not that. It would require much more capital, and there is nobody here to uphold that capital.

499. But supposing that the capital were provided, and the boats were built, would it answer then?—No, I think not.

500. Do you think that there are not sufficient fish o catch, or that the fishermen here could not compete with the men further south?—If the men had trawls and trawling vessels they would be obliged to have them as big as the others, and I think that there is not that quantity of fish to catch that would maintain three or four trawlers all the winter, and three or four would not be sufficient to maintain all the fishermen here. Then again, they would very speedily clear the fishing ground; they would take away all the fish there are off here, and they would have to go further to seek for fish. They would gradually impoverish the place, and the consequence would be that they would have to go further afield to seek a living.

501. I understood, from what you said, that there has been a considerable increase of trawlers upon this coast latterly?—Yes, there has been a great increase.

502. Then, suppose that the trawling boats were sent from here, would it not be more convenient than to send them from Hull and further south?—That is very good, but will the fish increase as fast as they can catch them?

503. I presume that the trawlers must catch fish or they would not come at all?—That is a question I cannot answer.

504. Now, supposing that the capital were provided and the boats built, do you think that it would answer for the people of Cullercoats to adopt trawling?—No; they would not do it; they could not make anything out of it.

505. Why not?—Because they have no harbour to put their boats in.

506. But there is a harbour close at hand; could they not go into Tynemouth harbour?—Yes, they could do that, but there is no fish to supply them and they would impoverish the ground.

507. You think it would not answer here because there is not enough fish to catch?—There are not enough fish to keep them continually trawling; they would catch them all very rapidly, in the same way as they have caught them at Torbay and off the Humber.

508. Then how do you account for the fact that the trawlers come from the south and fish here?—Why they come and fish here because there is nothing south for them to fish.

509. Then, in your view, the fish southward of this have diminished to such an extent that the fishermen are obliged to come here to fish?—They will augment again further south when the herring fishery commences.

510. According to your opinion the fish in the south has very greatly decreased?—Yes; they send the trawls away here because they cannot find enough for them at their own place. In winter time they send them here; in the summer they are obliged to send them to Iceland and Faroe. I speak of these boats now because they have been making great catches of cod, and have been going out again; but in a few years there will be nothing left for them.

511. How long have they been off this coast?—For about two years. To my knowledge they have been trawling here for two years.

512. Do the fishermen here occupy themselves all the year round with fishing?—Yes, they have no other occupation.

513. Then they do not go alternate voyages?—Some do, but not always.

514. The general occupation of the men is fishing?—They fish all the year round; they take the herring season and the haddock season, and then they fish for white fish generally. The greater number of them do that.

515. They do not go small voyages and go back again, but they fish for the greater part of the year?—Some of them may go for short voyages, but generally they are fishermen and engaged in fishing all the year round.

516. Do any of them belong to the naval reserve here?—Yes, I believe that a good few do.

517. Can you say how many belong to the naval reserve?—No, but I believe about eight.

518. (*Mr. Caird.*) At what rate do the trawl-boats drag the trawl through the water?—If there is a strong wind it depends upon the kind of fish you are expecting to catch. If you want to catch soles you must not go fast because you have to get them out of the mud; and if you want haddocks and plaice you must let the vessel go at a greater speed. You cause your vessel to go according to the fish you desire to take and the ground which the fish inhabits. If you want plaice or haddock you must make the boat go fast through the water.

519. At what rate would the vessel go when you are engaged in plaice or haddock-fishing?—A knot and a half, or two, or even three knots an hour.

520. Would not that cause a strong stream in the net?—Yes; the net is all bulged right out until she gets her weight into her.

521. Would not the stream be so strong that small fish could not get out through the meshes if they once got in?—I think they might get out until the quantity of fish became so great that it would prevent them.

522. (*Mr. Lefevre.*) Do you think that there is any means of enforcing a close time? Do you not think that the constant fishing without intermission has a tendency to decrease the fish? Would it not be better to require the fish to be caught only at particular seasons?—No, I do not think that fishing with a line requires any regulation. I do not think that it would ultimately prove injurious to the increase of the fish. The greatest destruction of fish is caused by the trawling, because one half of those which are caught are not fit for the market, and they are thrown overboard.

523. And taking the herring fishery, do you think that any arrangement might be come to with regard to a fence time or close time, which might have the effect of increasing the supply of herrings?—I think you would increase the number of herrings caught if you could put an end to the fishing by Frenchmen. They take such very large quantities, and they take them too at spawning time.

524. But that is not my question. I want to know if in your opinion the establishment of any fence or close time would increase the quantity of herrings?—There is one particular time and only one, and that is the winter fishing. Now if that were prevented, say for a couple of seasons, I really believe there would be a large addition to the quantity of fish.

525. What fishing is that?—The Yarmouth fishing and the fishing off the coast. You can go 60 miles off this coast and get a boat load of herrings down to December. I have known the Whitby boats come into the Tyne with very large catches of fish.

526. Are they fish that have spawned?—Yes.

527. In your opinion do those fish spawn in the deep water?—No, there may be some of them that spawn in deep water, but I have caught some very full herrings near the mouth of the Tyne quite ready to spawn. I do not know that I ever saw one on the deck with the spawn running out of her. Now I believe that if something were done to prevent that winter fishing for a few years it would greatly augment the number of fish. What I maintain is that the French fishing boats carry such a large number of nets upon our coast as to destroy our herring fishery.

528. With regard to the diminution in the catches of other fish, you think that the destruction of the fish is mainly attributable to the trawlers?—Yes.

CULLER COATS.

J. Templeman.

22 Sept. 1863.

529. (*Professor Huxley.*) Do you happen to know where soles and turbot spawn?—No; the soles spawn in the river, and I have caught a lot in the river when trawling there.

530. Have you caught large ones there?—Yes; I mean by a "full fish" a fish full of spawn.

531. I quite understand you. When do turbot spawn?—I cannot say when turbot spawn, but I should think about June.

532. Do turbot and plaice go to the banks for the same purpose that the white fish do?—Yes, I think so.

533. But they do not go there at the same time of the year?—No; I have caught them full of spawn, and I have also caught them quite empty.

The witness withdrew.

T. Bolam.

Thomas Bolam called and examined.

534. (*Mr. Caird.*) How long have you been a fisherman here?—I have followed the herring fishery for 21 years, and the white-fishing for about six years.

535. I will speak to you first about the white-fishing. In the course of those six years have you found that the supply of white fish has increased or diminished?—It has diminished a little gradually each year that I have been at it.

536. Has that diminution been in the number of the fish caught, or in the size of the fish caught, or in both?—There has been a diminution both in the number of the fish and in the size, besides which they have not been in quite so good a condition. We have not caught such large fish as were formerly caught here.

537. Have you noticed any marked diminution in the size of the fish?—No, I cannot say that there is any marked decrease.

538. There has been no such marked decrease as to have enabled you to observe it?—No, I think not.

539. You have been longer engaged in the herring fishery than in the white fishery, have you not?—Yes.

540. Then with regard to the herring fishery, in your experience do you find any great diminution in the total quantity caught?—Yes, very much so indeed, there are not near so many caught as there used to be.

541. Can you give us any idea in figures of what the decrease has been?—No, not in figures; but when I first went to the herring fishery 21 years ago, up to 14 or 15 years since the shoals certainly seemed much larger than they now are. We sailed about more; we first put our nets down in daylight, and if not successful we would then haul them in and sail about to find the shoals of fish somewhere else. Now we find them, it may be east, west, or north, and when we come across them they are quite small shoals, they are not one-tenth the size of what they used to be.

542. Then to that diminution in the size of the shoals do you attribute the decrease in the total catch of herrings?—Yes; formerly when we fell in with the shoals we were generally successful, and we would get in 14 or 15 cwt. with a couple of nets. Now we may fish for a month and four or five thousand will be a good take.

543. Is there any cause to which you attribute the diminution in the size of the shoal of herrings?—No, but I consider it is the natural consequence of trawling; the trawl sweeps over the ground, and it is calculated to sweep away the spawn and everything else. That is one great reason.

544. Then you attribute the decrease in the herrings to the trawls gradually impoverishing the ground?—Yes, I do.

545. But you only suppose so, you have nothing to prove that that is the cause?—Yes, that is the only feasible reason that I can see.

546. Have you noticed any difference with regard to the size of the herrings now caught as compared with what were caught formerly?—No, not in the size.

547. Is the season for catching the herring the same as it used to be?—Yes, we commence in July, and this is about the time we generally close the fishing.

548. Do you know whether the herring spawn here?—They spawn here when the weather is fine; at such time the herring will approach the land very closely. In fine weather we have to increase our nets; the fish come in so fast that we have had the nets fastened to the bottom with the weight of the fish in them. We have frequently drawn up the nets full of tangles hard spun.

549. Then you would say that the fish deposit their spawn near the shore?—I think they give the preference to in shore, but they do not entirely confine themselves to in shore.

550. Have you any knowledge as to whether a shoal of herrings comes nearer in shore now than in former years?—The small shoals do not approach the land so near as the large ones. I have generally found that the heavier the shoal is the nearer they make towards the land.

551. (*Mr. Lefevre.*) Do they come near the land for the purpose of spawning?—When the weather keeps particularly fine they approach near the land, but if the weather is at all stormy they keep at a greater distance from the land.

552. (*Mr. Caird.*) With regard to the deep sea trawlers, do they come in shore at all?—If the ground is not hard they come in. We have hard ground here generally speaking up to about six miles off the land; then after that we have a sandy bottom for about three miles east and west, that will give nine miles. The trawlers come all over that three miles of sandy bottom, and four-fifths of our fishing entirely depends upon that ground. At certain seasons of the year we get fish on the hard ground,—well-matured fish. We get there bigger fish than we get upon the smooth ground, but it is only the poor fish that is found nine miles off. After you have passed the smooth ground you come to a clay bottom, a sort of mud bottom where there is nothing but suckers. You get no fish there at all. You frequently find haddock on the bottom about nine miles off.

553. (*Mr. Lefevre.*) Do you think that the herrings take to the smooth ground in preference to the broken ground near the shore?—All I can say is, that we get the herrings on the smooth ground at the commencement of the season and that as the season advances the fish come in upon the broken ground.

554. When the fish begin to spawn do they come near the shore?—At the commencement of the season we get them on the hard ground in very good condition.

555. Then that is before they have spawned I presume?—Yes.

556. Then I gather from that that they come near the shore for the purpose of spawning?—As the season advances the fish come nearer.

557. Do they come on the hard ground before they spawn?—I cannot say that they do. I think they do spawn sometimes on the hard ground. I do not know if they spawn on the smooth ground. At the commencement of the herring-fishing there are no spent fish; it is only towards this month that we get spent fish.

558. (*Professor Huxley.*) You told Mr. Caird that you had to come into the shallows to get your fish. What was the length of your head line there?—Do you mean the float?

559. Yes.—We had none there.

560. What is the depth of the net you used?—Six fathoms. It was allowed to go to the bottom where the fish were.

CULLER COATS.

T. Bolam.

22 Sept. 1863.

561. So that one half of your net would be dragging on the bottom?—Yes, and at each end would be an anchor.

562. (*Mr. Caird.*) Do you find that between one season and another you have a great difference in the catch of herrings? I mean that you have one good season followed by another that may be very inferior?—The fact is that there is a very great difference in the seasons; but within the last few years the seasons generally have been a great deal worse than they used to be in former years.

563. Have they been gradually becoming worse?—Yes, the catches of fish have been gradually decreasing for nine or ten years. There may have been one good season, another middling, another worse than that, but taking it generally there has been a gradual diminution.

564. Do I understand you to say that the whole of the herrings caught off this shore have gradually diminished in quantity?—Yes.

565. Notwithstanding that the boats have increased in number?—Yes.

566. You say that there is not as much caught as formerly?—I think there is not as much caught as formerly if you take both the French and us together.

567. Do you find that the French fishing boats interfere much with your fishing here?—Yes, they interfere with us very much.

568. Do they come in-shore as close as three miles?—Yes, they come in a great deal closer than that; they get in sometimes where they have no water for their nets to float, and they frequently come in with us. We have had our nets down in the water in the fore part of the night when they have come in and shot their nets over them. They have barrels and kegs for floats while we have only bladders, and if their nets come into collision with ours, as theirs are by far the strongest and heaviest, we are under the necessity of giving way to them or we should lose our nets altogether. If there is a strong wind they run down much faster than we do, and then they are sure to come into collision with us, and we are under the necessity of making way for them.

569. Do you agree with the previous witness that of the total quantity of fish caught off this coast the French fishing boats take more than one-half?—No, I do not think that; their nets do not suit the fishing as well as ours. They are heavier and clumsier nets. We have a lighter net, which is more pliable, and we can catch more fish in them; they are under the necessity of having such nets as suit their vessels. If they had nets like ours they would not pay them at all, they would not stand the knocking about they would get in such large vessels. Ours take one-half more the quantity of fish which theirs will.

570. Then you do not agree with the previous witnesses that the French fishing boats take more than one-half of the whole quantity of herrings caught off this shore?—I cannot say that I do; they take a certain portion, however, but our nets being better and more adapted for catching fish I think we get the greatest quantity.

571. Are you able to estimate the proportion which the French fishing boats take?—No, I cannot do that.

572. (*Mr. Lefevre.*) With regard to the French nets, can you tell me if they sink deeper than yours?—I do not think that their nets are any deeper than ours, but at any rate they use a good deal thicker twine. If their nets were similar to ours they would be much more pliable than they are, and they would catch more fish. The evil at present is that their nets being so much stronger, if we come into collision, as we have done very often, we either have our nets driven away or we have to haul them up at a place where there is plenty of fish. If we do not do that the consequence would be that we should either lose our nets altogether or have them fearfully torn. We are therefore forced to give place to them; we dare not come into collision with them. On the other hand, they do not mind anything with regard to us. We do not want to come into collision with them, but they do not care at all what they do with regard to us.

573. (*Mr. Caird.*) You mean that, you being in much smaller boats, they are stronger than you?—I am not speaking of the boats, but the nets. We have bladders for floats while they have barrels, and if our nets come into collision with theirs we are sure to come into collision with their barrels, which will go right through our nets, while our bladders do not interfere with their nets at all.

574. Then I presume that when you see them coming down upon you you have to move?—Yes, we have to move away and give place to them.

575. Does that occur very often?—Yes, and they know better where the fish are than we do. There are certain signs for the fish; they come in where they know the fish are, and when they get in we are obliged to go out of the way of them.

576. Do you think that if the French fishing boats were entirely prohibited within the three mile limit there would be any considerable increase in the supply of herrings to our market?—I think that if they were kept within their limits it would do us a great deal of good. If the law had been adhered to we should not have suffered so much, and I think it would be very much to our interest to enforce that regulation now. Unfortunately hitherto the limit has not been at all attended to.

577. May I ask if there was not a scheme got up here some time ago for carrying on the deep sea fishing?—Yes, there was.

578. I believe there was a certain amount of capital subscribed?—Yes.

579. Are you able to state what was the amount so subscribed?—I do not know exactly what was the amount subscribed, but I believe there were five vessels built which would cost from 300*l.* to 600*l.* each.

580. Were they built here?—They were built in Sunderland and on the Tyne.

581. Can you tell me what came of the scheme?—It proved quite a failure.

582. Did the men of Cullercoats go out in the boats?—Yes.

583. Were they fitted up as trawl-boats?—No, they were not trawl-boats at all.

584. Were they not intended to be used for the same purposes as the Brixham trawl-boats?—They were for line-fishing, not trawl-fishing.

585. They were not for trawl-fishing?—No.

586. Were they intended to compete with the trawl-boats?—Not at all.

587. Did they go to sea?—Yes.

588. And were they not successful in their fishing?—No, they were not.

589. To what do you attribute their want of success?—Well, there was a variety of circumstances. One thing was that they started at an unreasonable time of the year. And then, again, the fish they brought in were stale when they came to the market; they had been caught perhaps three or four days before, and the consequence was that they could get no price for them, and they found that the scheme did not pay.

590. But were they different in that respect from other deep-sea fishing boats?—No, not at that season of the year, but it was not carried out for long.

591. Am I to understand that you found it better to return to your old and usual mode of fishing?—Yes.

592. Are you able to tell me if there is any law or regulation in regard to fishing that in any way interferes with you in prosecuting your business?—No, I think not.

593. Is there any regulation as to the size of the meshes?—I think that there are 42 meshes to the yard in our herring fishing nets.

594. Does nobody come to inquire into the condition of your nets?—No; nobody ever comes here.

595. How do you know that there is such a law?—We do not know anything about it, we only hear of it.

596. (*Mr. Lefevre.*) Do you fish with nets of that sized mesh?—Yes, I do.

597. (*Mr. Caird.*) But I understand that it is not because you are restricted to that particular size by the law that you adopt it, but because you find that a certain size is the best size for catching fish?—Yes; it suits the fish better.

598. Nobody comes here to inquire whether you are breaking the law or not?—No; I have never seen anybody.

599. Is there any restriction for fishing any particular kind of fish?—No; I never heard of any.

600. You have no regulations whatever upon that subject?—No; not as regards white fishing at any rate.

601. Nor any other fishing?—No.

602. Is there any regulation with regard to trout-fishing?—Yes, I believe there is with regard to trout-fishing, but nothing else.

603. Is that by the recent law?—Yes.

604. Are there any regulations in reference to fishing oysters, crabs, or any other shell-fish?—No; shell-fish come at certain seasons, and we always fish for them if they are there.

605. There is no prescribed rule for the regulation of the different sorts of fishing?—No.

606. Nobody interferes or comes to enforce the law?—Not that I know of.

607. No one has come in the course of your experience which extends over a period of 20 years?—No; no one ever came here.

608. And now with regard to the boats. I believe that the Queen's vessels lie off this coast, do they not interfere with you?—No; they only come here to prevent collisions between us and the French fishing boats.

609. Do you think it advisable to have any fence months, or any restrictions as to the size of your nets?—Yes; I think they should be restricted.

610. Would you as a fisherman like to be restricted, or to consult your own convenience, and follow your own opinion?—Well, so far as I am concerned, I should like to have a thing that would suit myself and others.

611. Would you desire the interposition of the law in fixing the size of the meshes instead of allowing you to fix what size you considered to be right yourself?—If the law fixed the size that was right, I would rather have it than allow the fishermen to be left to fix it themselves.

612. Would you rather have it left to you, or would you prefer that the law should step in and tell you what size your mesh should be?—I would rather have the law step in.

613. Would you rather have every fisherman compelled to have his meshes of a certain size than allow him to fix them at what size he chooses?—Yes; because I am sorry to say that most of the fishermen are very selfish. Occasionally, in order to catch more fish, they will do what is not at all necessary.

614. Have you found that any loss has occurred to you from not having a fixed size of mesh?—I cannot say that we have.

615. Then why should you require anybody to interpose and fix the size?—Because what we have fixed ourselves is the mesh that suits the fish, namely, 42 to the yard. I think the law would do good if it fixed that as the size which all fishermen should have.

616. But suppose another fisherman takes another size of mesh, would you be injured in consequence?—No; I do not think it would injure us much. The only result would be that smaller herrings would be got, and that might have a tendency to reduce the quantity of fish. For my part I do not think that the fishermen in general would have their meshes different from what they are now.

617. Are there many shrimps caught off this coast?—Not many.

618. Are there any sprats caught here?—There are plenty of sprats here, but we do not fish them.

619. Is that because you do not find them worth fishing?—They are not found to be beneficial here.

620. Have sprats never been fished off this coast?—No; I think not.

621. You say you are aware that they come here?—Yes.

622. How do you know that?—I have seen them in the water. We get them in the river in large quantities at certain seasons of the year.

623. I understand you to say that it has never become an object for the fishermen here to fish for sprats?—No; but I have frequently seen them quite visible in the water.

624–5. At what season of the year do they come?—Just before the herring-fishing season.

626. Then that will be in June or July?—Yes.

627. In trawling for shrimps, I understood the last witness to say, that he had sometimes seen the spawn of soles destroyed by the trawl?—I cannot say anything about that; I have never been a trawler.

628. (*Professor Huxley.*) Would it be difficult to establish police regulations, by which the French fishing boats might be kept off the shore?—If we had the protection we ought to have, I believe there would be no fear of not having the law attended to. Sometimes we have had vessels down here which have kept the French boats within their limits, but I do not think that any attempt has been made to enforce the regulations as they ought to be enforced.

629. The fishing generally takes place in the night, does it not?—Yes it is all night work in the herring fishery.

630. Then suppose that the Frenchman shoots his nets five miles from the shore, will he not drift with his nets down upon you?—Yes, frequently he does.

631. I understand by that, that if he shoots his net outside the proper limit, then by the force of the tide or the current he drifts in?—Yes.

632. In such a case would you seize his nets and turn him out?—Yes, if he was beyond his limits I would do so.

633. But would it not be very difficult to do so?—I do not think there would be much fear of that if he shot his nets five miles off; the current does not generally set east and west.

634. But suppose there was an easterly breeze?—No doubt it would help it a little, but I have seen boats go out to sea even with an easterly wind.

635. To enforce the regulation would it not be necessary to have boats pulling all night over the fishing ground?—I do not think it would; sometimes we have had men-of-war here, and the French have known as well as we that the shoals of fish were in shore, and as soon as ever it got dark they came in shore and shot their nets among us.

636. Would it not be necessary for a gunboat to have a guard-boat pulling all night?—They must be there all night if they really intend to catch them.

637. Is it enough simply for a vessel to be here on the coast as a guard-ship, or is it not necessary that a guard-boat should be pulled over the fishing ground every night?—Both would be necessary. They would get along with a small boat much better than they do with the larger ones, but one vessel would, in my opinion, be insufficient to keep the French boats at their proper distance.

638. At any rate the vessel should be under weigh every night?—Yes, I think so.

639. In your opinion it would not be enough for the vessel to be at anchor at Holy Island?—No, certainly not.

640. It would not be much to the advantage of the fishing-boats for the gunboat to be lying there when the French boats were breaking the law at Cullercoats?—Certainly not.

641. Do you think that if a gunboat cruised up and down every night that that would be sufficient?—It would be necessary that she should do so, but I think there ought to be more than one vessel. There should always be vessels enough to keep the French boats within their limits.

CULLERCOATS.

T. Bolam.

22 Sept. 1863.

642. Have you any means of knowing what amount of fish is taken by the Frenchmen?—No, it depends entirely on the shoals of fish. There is one thing however in favour of the French, they always have an idea where the largest quantity of fish is to be caught, and they generally make for that place.

643. But you say that you do not know how many they catch?—No.

644. You state that the take of herrings has diminished of late years?—Yes, very much so.

645. Is that owing to the competition which you have had, or has it arisen from any other cause?—I do not believe that any people who catch fish in a fair way would diminish the quantity of fish at all. If there were not some other means of destroying the spawn, I do not think that the fish would at all diminish.

(*James Templeman, the previous witness.*) Three weeks ago I heard of a boat getting 7 lasts, and there are 10,000 in a last. There were none of the boats around but what could haul the same quantity. All those were taken in two or three nights; our boats cannot compete with them at all. In my opinion the Frenchmen catch by far the greatest quantity of the fish taken on our coast.

646. (*Mr. Caird.*) You are speaking of the herrings?—Yes.

(*Thomas Bolam.*) Within late years we have been under the necessity of shooting smaller nets although we have no large shoals; that has been because there has been occasionally a greater strain upon the nets, and we found that a thicker net in some cases would answer a good purpose, though in a general way our nets are thinner than those used by the Frenchmen in consequence of being made of a thinner twine. In large shoals slender nets will sometimes break away, the fish get into them with that force. Taking it as a general rule, however, the nets made with the smaller twine will catch more fish on the whole.

647. (*Mr. Lefevre.*) Is that because the fish see the thicker nets and fail to perceive the thinner?—No, that is not so, but where the nets are made of smaller twine they are much more pliable, and the fish are fastened in them much more securely.

648. (*Professor Huxley.*) Have you seen no signs to show you where it is that the fish breed?—I believe myself that they breed on this coast, but that is only a mere surmise.

649. Have you seen mackerel here?—Yes.

650. Do you fish for them?—No, that kind of fishing is not practised here. We have no nets for mackerel-fishing when they come in.

651. Do you go out habitually in bad weather in January and February?—We go out if the weather will allow us. We have to consider whether we shall be able to stand it or not.

652. I believe that none of your boats are decked?—No, they are not.

653. Then you cannot keep the sea?—As long as the sea keeps from breaking, these cobles are the best things that can be upon the water, but if the water breaks then they cannot keep the sea.

654. Does the quantity of herrings taken from year to year vary very much in other parts of the coast?—Yes, I believe it does.

655. For example, may there not be a very large quantity taken one year, and then very little in another for perhaps 10 years afterwards?—All I can say is, that upon this ground there has been a gradual diminution. Twenty years ago there were very heavy takes, and if the fishing had been prosecuted with the industry with which it is prosecuted now, the takes would have been enormous. I have seen the fish in shoals east and west, north and south, but I never see that now.

656. Is it 10 years since that took place?—There has been considerably less fish taken these last 10 years than there were in the previous 10 years.

657. Do you ascribe that entirely to the trawling?—I do to a certain extent. The trawling destroys both the fish and the spawn, and I think that is the reason.

658. But we hear that there was no considerable trawling on this coast until within the last 6 years?—I do not think that that makes it different. The fish come at certain seasons of the year, and if they are destroyed at other places why they cannot come here.

659. But they have been trawling down south for a great number of years,—for a century or more,—so that the work of destruction should have made itself felt before. I think you all agree that the falling off here only took place about 10 years ago?—Yes, about 10 years.

660. The trawling down south has gone on for a great number of years; are you not aware of that fact?—Yes, but it has not affected the fish here until within the last few years. They have now recently begun to come near our place, and the fish are rapidly diminishing. I think that may be the reason that the falling off has been more noticeable than it was 10 years ago. My opinion is that if the spawn is destroyed it must stop the fish from coming here.

661. (*Mr. Lefevre.*) Have you yourself ever trawled at all?—No, I have not.

662. Then you have no experience that enables you to say whether the trawls do really fish up the spawn or not?—No, I have only the evidence of other fishermen; I think myself that the very nature of the thing must be destructive when we know, and it is acknowledged by all, that the trawls bring up small and immature fish. Surely that is likely to destroy the fish.

663. How far does the fishing off Cullercoats extend?—From Souter End, the south part of the Tyne, to Blyth, and perhaps rather further than that.

664. Do you meet the Newbiggen boatmen there?—Yes, there are no more fishermen until we get to Newbiggen.

665. Do you and the Newbiggen fishermen interfere much with each other?—Sometimes we come into collision with the Newbiggen men, but it is not often.

666. Do you consider that you and the Newbiggen men occupy the ground off this coast?—Yes.

667. I believe that you have had more experience with regard to the herring-fishing than the white-fishing?—Yes; there are various reasons assigned for the fish having fallen off. Some think that there are too many fishermen. Now I do not think so. For instance, there were 10 boats when our friend commenced fishing, now there are 40, and our fishing extends from Souter's End to Blyth. Now if there were only 10 boats, I do not think those 10 would be sufficient to fish the ground over, and if the fish became as numerous as they did before, each boat would be as successful as they were before they were interfered with by the trawlers.

668. You think that ten boats would not be sufficient to occupy the ground, if the fish were as plentiful as they used to be?—Yes, there is that space of sea to fish in, and each would be clear of the other, and there would be no collision.

669. (*Professor Huxley.*) Do you think it would be the same thing if you had 500 boats fishing?—No, there is a medium in everything; but if the fishing were not carried on in a destructive way—if the only fishing practised was the hook fishing we practise—I do not think it would impoverish the sea.

670. Then, you do not think that the decrease in the number of fish is due to the Frenchmen?—No, I do not think so; what are taken by the Frenchmen are as nothing compared with the quantity of fish that are destroyed by the trawlers.

671. Taking into consideration the increase in the number of the French boats, you do not think that the ground is over fished?—No, I do not think so; when we take into consideration the large number of fish that arrive, I think it is only a small portion that would be caught if fished for in a legitimate way.

CULLER-COATS.

T. Bolam.

22 Sept. 1863.

It must be borne in mind that there are large numbers of white fish which feed upon other descriptions of fish themselves.

672. Where did you see that question argued; have you ever seen it discussed?—When we catch a cod fish we frequently find inside him perhaps a score of herrings, and we find as many as that in the inside of a black jack. Now, at times, we take 3,000 or 4,000 fish in a net, and when these fish come into collision with the nets they would take every one of our fish out.

673. (*Mr. Lefevre.*) Is there a large number of dog-fish on your coast?—Lately there has not been so much as there used to be; when we had more herrings off this coast there used to be far more dog-fish.

674. Then your opinion as to the diminution in the quantity of fish having been caused by trawling is rather from what you have heard than from what you have seen?—I understand the nature of trawling, and when I know that in trawling the trawl scrapes up everything, even large quantities of immature fish to be heaved away, I cannot help being convinced that trawling must be destructive.

675. But what do you say with regard to the herrings?—Why, if they destroy the spawn of the herring, then it must have the same effect that it has with regard to other fish.

676. (*Professor Huxley.*) Do you think that all these immature fish you speak of would grow up to be full-sized fish?—I cannot say.

677. Are there not many other fish that prey upon them?—Yes, a great many.

678. Can you form any opinion as to how many per cent. would grow up to be full-sized fish?—No, I cannot say.

679. Nor how many of the eggs?—No, I cannot say.

680. (*Mr. Lefevre.*) With regard to the white-fishing—the haddock, cod, and so forth, do you attribute the diminution in them to the trawling?—I think it is the most reasonable thing to say that it has been occasioned by the trawling. In hook-fishing all the fish are useful when they are caught, but when you get immature fish, spawn, and such things as that, as you do in trawling, it must be fearfully destructive.

681. How far does your fishing for ling, haddock, and cod extend; is it confined within the same boundaries?—No, you have to go further for the big fish. For ling and turbot, and so on, you have to go from six miles to nine. There are six or eight boats that follow the big fishing which go out considerable distances—probably 20 miles from the land.

682. Have you often been out that distance yourself?—No, I have never been out there.

683. Where is it that you have been fishing?—Over the ground that I described before.

684. Have you suffered any injury in consequence of the trawlers carrying away your lines?—Yes, I and the other men in the boat with me came into collision on one occasion with the trawlers, and they took away a piece 68 fathoms.

685. How often did that happen?—Only once.

686. How long is that ago?—That was about two years since.

687. And it has only happened once?—Only once.

688. And that occurred within your own experience?—Yes.

The witness withdrew.

JAMES BAILEY called and examined.

J. Bailey.

689. (*Mr. Caird.*) I believe you are not a fisherman yourself?—No.

690. You are a herring merchant, I believe?—Yes.

691. Do you buy the herrings as they are caught here?—Yes; I buy them here and in different places.

692. Do you sell them fresh?—Yes, both fresh and salt.

693. Have you been long engaged in that business?—Yes, for about seven years.

694. Then do you buy most of the herring that comes ashore here?—I buy a great portion of it.

695. Can you tell us with any accuracy—can you give us any figures—to show us the relative quantity that was caught seven years ago, and in each year since up to the present time?—No, I cannot. I have kept an account for the last two or three years, and I find they have been diminishing greatly. The average fishing per boat last year was 31,000 per boat. That was in the year 1862.

696. You do not know what the average fishing was seven years ago?—No, I do not.

697. Can you tell me what it was six years ago?—No, I did not keep any account then.

698. Nor what it was in any other year except the year you have mentioned?—No.

699. Then you cannot tell us really as a fact what the difference is?—No.

700. But you believe that the quantity has greatly diminished?—Yes, it has diminished very greatly.

701. Can you place any figure on the diminution; has it diminished a quarter or a half?—I should say it has diminished by a quarter.

702. Do you think that the total catch of herring off this coast has diminished one-fourth within the last seven years?—I should certainly say that it has.

703. Was the catch of fish last year a good catch?—No, it was a bad year.

704. Is there any improvement this year?—Yes, there has been a slight improvement, and my calculations will be better this year than they were last.

705. Does the catch vary much from year to year?—It has only varied for the worse. I have found the quantity caught gradually diminishing year by year. I have been connected with the herring trade upon this coast for about 10 years, and every year I have found it getting gradually worse.

706. Has the price of herrings during the last seven years varied much?—It has got a little higher.

710. Seven years ago was there any railway communication here?—Yes.

711. Then there is no difference in that respect?—No.

712. You had the same facilities for getting the herrings to market then that you have now?—Yes.

713. Has the price of herrings increased during that time?—Yes it has.

714. Is the price of herrings much higher than it was seven years ago?—Oh yes, a good deal.

715. Can you tell us how much?—About seven years ago I could have bought herrings, when the fishing was on, for about 10*s.* or 14*s.* per thousand.

716. And what is the price now?—The price at the latter end of the year 1861, and during the year 1862, was never below a pound a thousand except one morning, when it was 18*s.*

714. When did that increase of price begin? In what year?—I think it has been a gradual increase.

715. And has that increase of price been caused, do you think, chiefly by a diminution in the supply?—Yes, I think that has been the cause.

716. Then it is because the supply has been getting less every year?—Yes, the supply has been getting less every year. I was born here, and I have been about the fishing all my life. About 15 years ago the herrings were as low as 3*s.*, and from that to 5*s.* a thousand.

717. But you are giving us your experience of a time when there was no railway communication, and that is hardly a fair comparison?—But there was railway communication at the time I am speaking of. Most of the fish at that time went from here to London.

718. But not by railway?—Yes, they went by railway; they were taken by way of South Shields, and sent on from there.

719. How many years ago are you speaking of?—About 15 years ago.

CULLERCOATS.

J. Bailey.

22 Sept. 1863.

720. What do you say was the price then?—From 3*s.* to 5*s.* a thousand.

721. And the price has gone on increasing until it is seldom under 20*s.* now?—Yes.

722. With regard to the consumption of the fish, are there a greater number of fish consumed in the immediate neighbourhood, or is the majority sent away?—There is a great number consumed in the neighbourhood, and a good deal is sent to Carlisle, Liverpool, and other places.

723. Are there any herrings caught on this coast except during the months of August and September?—Yes.

724. So the market is always supplied with herrings during the other months of the year?—Yes, it is.

725. Where do the herrings come from then?—They come from different parts. They sometimes get them north of the Forth, and sometimes from the Isle of Man, and from different parts of the coast.

726. Is it fresh herrings to which you refer?—Yes; there are fresh herrings in the market nearly all the year round.

727. Has there been any appearance of herrings here when in winter they have been caught in the Firth of Forth?—No.

728. Then you never saw them come here except in what is commonly known as the herring season?—No.

729. (*Mr. Lefevre.*) Do they come from the north down here?—My opinion is, they do not travel the island. They come out of deep water, they deposit their spawn, and then go back again.

730. (*Professor Huxley.*) Have you ever heard of herring appearing here in the months of January or February?—I have heard fishermen say that they have seen a shoal for a day or two, but they disappeared again, and they have not been seen so that they could be caught.

731. Have there ever been any signs, such as those which usually precede the arrival of herrings,—gulls, and so on?—I can hardly say. I have been told that large shoals have been seen, but they have not been tried for.

732. Have you any notion of the cause of the diminution that has taken place in the quantity of herrings?—I have no notion, except it is, that there is a destructive agency with regard to trawl-nets going on.

733. I understand you to say that the diminution that has taken place has been going on regularly for the last 10 years?—Yes.

734. But we have been told that the trawling has only been going on for the last six years?—I cannot state how long the trawling has been going on.

735. I presume you know that the catch of herrings varies very much even where there is no trawling?—Yes, I believe it does.

736. (*Mr. Lefevre.*) Do you confine your purchases to Cullercoats, or do you purchase from Newbiggen and other places?—I do not purchase from Newbiggen, but I purchase fish at Boulmer and other places.

737. Have you noticed the same diminution in those places as that which you have observed here?—I cannot say that I have, but they have not had boats very long at Alnmouth. At one time it would scarcely pay for the getting of the fish in.

738. Do you purchase other descriptions of fish?—Yes.

739. Have you observed the same diminution in the other fish that you have observed in the herring?—Yes, particularly in the cod fish.

740. Do you purchase them off the coast in the same way as the herrings?—Yes.

741. Have you also noticed the same diminution in the quantity of haddock and ling?—Yes.

742. How long has your experience been with regard to the other fish?—About four years.

743. To what do you attribute the diminution in the case of the white fish?—I attribute it to the same cause, namely, to the spawn being destroyed by the trawlers.

744. We understand that the beam-trawlers do not bring in their fish to these parts?—No.

745. Then you have had no opportunity of purchasing ling, or haddock, or cod of them?—No.

746. Then you do not know what they have caught on the average?—No; but I was over at Sunderland the other day and they wanted me to purchase a number of fish that had been caught by the trawlers, but I would have nothing to do with them.

747. Did you look at them?—Yes, I examined them, but I did not think them fit for the market.

748. You do not know what the quantity caught off this coast by the beam-trawlers is?—No, but taking into consideration the fecundity of the fish I should think it must be very great. But at the present time there must be at least 100 per cent. destroyed, or even more than that; there are more destroyed than the quantity of fish taken and sent to the market. The destruction years ago compared to the present time was very small indeed.

749. Do you mean the destruction years ago by the trawlers?—No; I mean the destruction with regard to the fish taken by the hook, but if you calculate that 100 per cent. of the fish were destroyed you would find that there ought to be a still greater quantity of fish than is caught here.

750. I want to know what is the quantity caught by the trawlers, not by the line-fishers?—I cannot say what is the quantity that is caught by the trawlers.

751. (*Mr. Caird.*) In your experience has the size and weight of the fish diminished of late years?—Yes, it has.

752. Have you noticed that perceptibly?—Yes, in the haddock and in the cod particularly.

753. Are there more immature fish taken?—They are not so large as they used to be.

754. Probably they are younger fish?—Yes, of course.

755. Are they in the same condition?—No, they are not. Both this season and last season I could scarcely get a cod at all.

756. But you say that you buy nothing of the trawl-fishers at all?—No, I buy nothing of the trawlers.

757. (*Mr. Lefevre.*) Do you know whether the trawl-fishers caught many cod fish last year?—I have not heard much of cod being taken by the trawl.

758. (*Mr. Caird.*) You speak of the size having diminished, what would be an average-sized fish? What would it weigh?—We consider that a good cod weighs a stone, or a stone and a half; some weigh more than 3 stone.

759. But the average would be from 14 to 21 pounds?—Yes.

760. Do you think that fish of that size has greatly diminished?—Yes.

761. Then you are not getting so many fish now weighing from 21 to 30 pounds in weight as you used to get in former years?—No.

762. What do you think the average size is?—From 14 to 21 pounds.

763. And they used very often to exceed that?—Often, previously. But in point of fact they are much smaller here than they are further north.

764. Has the price of cod increased?—Yes, very greatly so.

765. Can you tell us what the difference is within your experience since you began to deal in fish?—Since I began to sell, the price has gone up from 20*s.* to 25*s.* per score.

766. What was the price 20 years ago?—It would be about 20*s.* per score.

767. What is the price now?—Twenty-five shillings.

768. (*Mr. Lefevre.*) The codfish follow the shoals of herring, do they not?—Yes, you get cod now wherever the herring is.

769. Do they remain off the coast all the winter, or do they leave it when the herring leaves?—They leave it when the herrings leave.

770. (*Mr. Caird.*) What may be the weight of a

score of cod?—Why a score is simply 20 fish; 18 inches from the tail to the head, we call that a size fish.

771. Then you sell them without relation to the weight of the fish?—It would only count as one even if it were as large again.

772. Has the standard altered at all?—No.

773. But if the size has diminished, surely it ought to have been altered?—There ought to be an alteration, but the fishermen get so few fish now that they will not allow it.

774. But it would be rather to the interest of the fishermen to diminish the standard?—I should think it would be, but it would not be to the interest of the buyers. They have taken off 4 inches from what it used to be 20 years ago; it used to be 22 inches, and now it is only 18.

CULLERCOATS.
J. Bailey.
22 Sept. 1863.

775. Then there has been a change?—There has been no change for some time. Further north there is a difference, I believe.

776. There has been no change in the standard here?—No.

The witness withdrew.

EDWARD CLARKE called and examined.

E. Clarke.

777. (*Mr. Caird.*) Do you live at Cullercoats?—Yes.

778. How long have you been engaged in the fishing here?—About 27 years.

779. Is your occupation solely that of fishing?—My occupation is solely that of fishing now.

780. Then for 27 years you have been engaged in white-fishing and herring-fishing?—Yes.

781. Do you fish for soles?—Yes; close in at the Castle where we can do no harm. The trawlers in the deep sea take away the spawn, but no spawn lies where we fish.

782. How far do you lie off the shore?—About a quarter of a mile.

783. In what depth of water do you fish?—Six fathoms is the greatest depth; sometimes it is only two fathoms.

784. In what manner do you fish for soles?—We fish with a trawl similar to that which the smack has.

785. But a trawl of a lesser size?—Yes, a smaller size.

786. At what seasons do you fish for the sole?—We begin about the month of July, and we fish as long as we have a mind to continue.

787. And how long is that?—We are thinking about knocking off now. They will be going more into fresh water now.

788. Do you ever find that you bring up any spawn in your nets?—No, I have never seen such a thing. There is nothing there but just the bare fish at all.

789. Nothing but the sole?—Nothing but flat-fish and sole.

790. Do you get any small fish—young fish?—No; we sometimes get a gurnet or two. We got two gurnets this morning.

791. Do you not fish at any other season than from July to September for soles?—No, we only fish about four months in one year.

792. Has there been any complaint made against you for disturbing the spawn?—No, I never heard of any.

793. Do you ever fish for shrimps?—No, never.

794. Do you ever fish for sprats?—No.

795. Do you ever see any sprats off here?—Yes, sometimes in great numbers.

796. Do you not think it worth your while to go for them?—No, they would go through the nets just the same as shoving a needle through.

797. Have you no nets adapted for catching sprats?—No.

798. Then they come here and go away without being caught?—Yes.

799. When you have seen them, were they in large numbers?—Yes, in very large numbers. We sometimes get them close in shore to bait our lines with when we are going for sandeliers and such like as that.

800. Do you catch them with nets?—No, with our hands, when they are tied in entirely.

801. Do you mean when they are stranded?—Yes.

802. And now with regard to soles, how long have you been catching soles?—I have been at it for about 20 years.

803. In the course of those 20 years have you found that the number you take has diminished? Do you catch less now than you used to catch?—Yes, a great deal fewer than we used to catch, and there is not half the immensity of fish there used to be in the haddock-fishing.

804. Are the soles about the same size they used to be, or are they larger?—They run very small. This year they are smaller than I have seen them for many years.

805. Do they run smaller some seasons than others?—In some seasons I have got 40 and 50 pair in a night, and in the whole of the 50 pair there has not been any pair over a decent size.

806. You are speaking now of this year?—Yes.

807. With regard to last year was it the same too?—Yes.

808. The year before that—was there much difference in that year?—I cannot say; they might run a little bigger, but they have been uncommon small these few years past.

809. What do you think has been the cause of it?—There have not been such great quantities as I have seen. I have seen greater quanties also of haddocks than come now. The sole-fishing has also decreased.

810. How many boats are employed in the sole-fishing here?—There have been only 4 engaged in sole-fishing this year.

811. Were there more than 4 in former years?—There have been 9 or 10, and I have seen as many as 14; but the men have got more into the way of going herring-catching with their big boats now. The young men go into the trawl-fishing, and us old men keep to the sole-fishing.

812. Does the other fishing pay better?—I should think so.

813. You say that you have also been employed for a considerable time in the line-fishing?—Yes, for 27 years.

814. Do you fish the line-fishing when you are not fishing the sole?—Yes.

815. Is it at a different season?—Yes.

816. When do you begin the line-fishing?—In about a week's time from this.

817. And do you continue it during the whole of the winter?—Yes.

818. Do you get as many fish now as you used to get?—No; not one half or one quarter the quantity. When I first came into the boats we used to carry 28 pieces of line. I have gone off and just shot half of my lines in coarse weather and I have got 15 creels. Six or seven of the boats now will not bring the same quantity ashore. If we had shot all our lines we should have got 30 creels.

819. What time is this of which you are speaking?—Do you mean when we could have caught 14 or 15 or 30 creels?

820. Yes?—It would be about 14 or 15 years ago.

821. When did the fish begin to fall off?—About eight or nine years ago.

822. Were there more caught then than there are now?—Yes.

823. When did they begin to fall away perceptibly?—I believe about six or seven years ago.

824. Do you find that the size of the fish you catch now is larger or smaller than it used to be?—They are smaller fish. We have got 30 creels of fish

CULLER-COATS.

E. Clarke.

22 Sept. 1863.

each of which would be as much as one woman could carry, and we have also caught nearly as many as 40 large haddocks. Two or three of our boats may go off now, and they will not bring four creels among the whole of them, and what they do bring are quite small things, just half-grown haddocks.

825. Have the cod equally fallen off in size?—No, I do not see any difference in the codfish.

826. Are they as large as they used to be?—Yes, they are just about the same size.

827. Then is it only the haddocks that have fallen off in size?—Yes; I know there is a vast deal of difference in the big haddocks from what there used to be.

828. What do you think is the cause of the fish falling off?—I can blame nothing but the trawl-fishing. They are trawling exactly on the ground on which we used to shoot our lines, and if we were to fish there we should run the chance of losing the whole of our lines because they trawl right across where we should fish.

829. Do not the trawlers generally trawl outside of where you shoot your lines?—No, they do not, sometimes we have to go outside of them into 26 or 27 fathoms of water.

830. How long is it since these trawl-fishers came upon your ground?—I cannot tell how long it will be.

831. Is it two, three, or four years since?—I do not know. It may be more than that, but they have been more here this summer than they were known to be before.

832. And have you caught fewer fish than usual this year?—There is nothing to get now but a few small whiting, and that is a fish which swims between the top and the bottom. The haddock swims close to the bottom, but the whiting swims betwixt the top and the bottom.

833. And they are not in the way of the trawl?—No; but the trawlers take away the spawn of the fish. There is no fish but that has to leave its spawn. I believe they leave all their spawn in deep water and none in the shallow water.

834. (*Professor Huxley.*) Do you trawl habitually?—Yes.

835. Do you bring up your trawl pretty full occasionally?—No.

836. Have you done so in former years?—We have got a long way more in former years than we do now.

837. Is the fish which you bring up with the trawl spoiled?—No; there is not over 10 minutes between set and set till such time as the trawl will have taken the fish and we heave it into the boat.

838. Do you mean that your trawl is not overboard more than ten minutes at a time?—No.

839. Do you ever find that you get fish with the gall bladder burst?—No.

840. And you have no spoiled fish?—No.

841. Have you ever been out trawling in the deep water?—No.

842. Do you know of your own knowledge whether large quantities of fish are spoiled by that mode of trawling?—Yes, it has been known that they have heaved tons overboard.

843. What do you ascribe that to?—I think it is owing to the trawlers making such a long continuance before they haul their trawls aboard.

844. Is the mesh of your net the same size as the deep-sea net?—I cannot say.

845. What is the size of your net?—It has a mesh that runs from about an inch to an inch and a half.

846. Do you ever catch small fish in your trawl?—No, none.

847. That is to say, that although the size of your mesh is not large you catch no small fish?—All we catch are in shallow water; they are generally soles, except a chance time, when we get a chance gurnet.

848. Do not you catch small soles as well as large ones?—Yes.

849. Then what do you do with the little ones?—We take them all away to market.

850. How do they get out of the net if the mesh is not more than an inch and a half wide?—I only catch them so big (*measuring*); they must come to more perfection before they come into shallow water.

851. Then, in trawling in-shore you never catch small fish?—No, we do not.

852. Did I not understand you to say that you caught sand eels?—No, never. I catch sandeliers.

853. What are they?—They are a sort of flat-fish.

854. Then, the fact is, with your trawling in-shore you never get small fish?—Never smaller than what I told you.

855. What is the length of the smallest fish you get in your trawl?—About 5 or 6 inches.

856. Do you ever get spawn in your trawl?—No; it is impossible for us to do so. There is no spawn where we trawl.

857. What is the depth of water where you trawl?—It will be from four to six fathoms in depth.

858. Then you do not believe that the trawling in-shore does any harm to the spawn?—It cannot, because there is no spawn to take from the bottom. We cannot do any harm. Where the fish cast their spawn is not the place where we fish. It is the other trawlers that take all the spawn.

859. I do not, at present, want to know about the trawlers outside; but I want to hear from you what your own experience has been. You say that you never take any spawn in your trawl?—No; during a storm and with a heavy sea the sea will rise and break 12 feet, and no spawn could lie there. It must be in deeper water.

860. In your judgment, at what time do soles spawn?—I cannot tell that; that passes my judgment.

861. When do you get them full?—I cannot even tell you that. When we get this kind of fish we do not open them, and therefore we do not know if there is spawn in them or not.

862. I understood you to say that you are a line-fisherman when you are not engaged in trawling for soles?—Yes.

863. Do you suffer much from the dog-fish?—Yes, a very great deal.

864. How much fish will a dog-fish take?—We have been off and come ashore with only one large fish between a cod and a codling. I have seen every other fish on the hooks destroyed.

865. Did you find the remainder of the fish on the hooks?—Yes.

866. You mean the heads of them?—Yes.

867. How many fish do you think had been caught that night?—I should say as many as three or four women folks could have carried.

868. And all of them had been eaten by the dog-fish?—Yes.

869. So that you are liable to have a good deal of waste even in line-fishing?—Yes, when the dog-fish come in they are terrible things.

870. (*Mr. Lefevre.*) The beam-trawlers do not catch the whiting, do they?—No, we are not in the habit of catching whiting or anything of that sort with a trawl.

871. I mean the people who trawl outside?—Yes, they get everything.

872. Whiting as well as other kinds of fish?—Yes, whiting, haddocks, gurnets, and everything we fish for in the winter season. They take all those fish away in the summer season. Whiting are principally on the top; the haddock is near the top too.

873. Have you observed the same diminution in the number of whiting caught as in the other fish?—Yes.

874. Have you yourself lost any lines in consequence of the operations of the trawlers?—I have not lost any myself, but some of our people have lost them even before they commenced the herring season.

875. But you have not lost any yourself?—No, I have lost none, but three or four other people have.

The witness withdrew.

WILLIAM SCOTT called and examined.

876. (*Mr. Caird.*) Are you a native of Cullercoats ?—Yes, I was bred a fisherman in Cullercoats.

877. Have you been long engaged in the fishing here ?—Yes, between 30 and 40 years.

878. And have you been engaged in fishing for all the kinds of fish that are caught off this coast ?—Yes.

879. You have been employed in the herring-fishing ?—Yes, at all kinds of fishing; both herring and haddock, ling and turbot, soles, and all other kinds.

880. Have you ever been engaged in the deep-sea trawling ?—No.

881. In the course of your experience over so long a time, do you find that you cannot catch as many fish now as you used to catch, in the same boat ?—No, not half the quantity.

882. When did the great falling off begin ?—About seven or eight years ago, I think.

883. About seven or eight years ago had the number of fishermen employed in the boats increased considerably compared with what it had previously been ?—Yes, the number had increased but they were getting less fish.

884. Were they still getting a good many fish each boat ?—About seven or eight years ago they were getting a great many fish.

885. Did the quantity of fish taken begin to diminish about six or seven years ago ?—Yes.

886. How much has it fallen off since?—I know that a great quantity of fish were got at that time; 10 or 12 creels of fish were got then where we do not now get half that quantity.

887. Do you mean in the same length of fishing ?—Yes.

888. Then you think it has fallen off one half at least ?—Yes, I think so.

889. Has the size of the fish fallen off as well ?—Yes.

890. That has been perceptibly noticeable ?—Yes.

891. You have no doubt about it ?—No; the haddock we now get are quite small fish They are very small. We scarcely get a large haddock among them.

892. Does the same remark apply to the cod ?—I do not think they are quite as big now as they were then.

893. There is not such an evident falling off in the cod as in the haddock ?—No; I think not.

894. I understood you to say you had had some experience in trawling for soles ?—Yes; I trawl close in here. I go with a brother of mine; we yoke together. I have since gone to the herring-fishing. I have also been trawling and fishing for salmon trout.

895. Can you get the salmon trout in the trawl ?—No; we have proper trawls for that sort of fishing.

896. Do you ever find spawn in your nets ?—No; never in my life.

897. Have you observed that the size of the sole has diminished as well as that of other fish ?—Yes; they are quite small now. We get them in the roadstead where the ships bring up in from two to five and eight fathoms of water.

898. When do you fish for salmon trout ?—In the latter part of May we generally begin, and we knock off in September.

899. How do you catch them ?—With a salmon trout net.

900. What is the size of the mesh ?—Four inches.

901. How do you use it ?—We put one end close to the shore and moor it there. We then lie by the nets.

902. And I presume you lift them when you think there is anything in them ?—Yes.

903. Are the fish caught in the meshes ?—Yes; they are properly meshed.

904. Do you get many ?—Sometimes we do.

905. Have you observed any falling off in them ?—Oh yes; the bag nets and stake nets have been a great injury to us.

906. Does that apply now ?—No; the Act of Parliament has taken them away, but this is only the first year they have not been used.

907. Have you noticed any difference ?—Yes; there has been a little difference this year. There was a bag net off St. Mary's Island. We fish down the river.

908. Was there any bag net at the mouth of the Tyne ?—There used to be on the Hard Sands, but they are done away with now.

909. Has the use of bag nets diminished the quantity of salmon caught here ?—I daresay it has.

910. But you do not know ?—No; but with their being done away with, I think that in the course of a few years the increase will come on again.

911. You will catch them then ?—I think we ought to catch them.

912. Have you had anything to do with the French fishermen on this coast ?—No; in the course of my lifetime I have, but not for many years.

913. Have you been engaged in the line-fishing ? Sometimes I have been, but we do not go so far off as the young men do. We follow in-shore fishing.

914. Have you ever seen large shoals of sprats off here ?—Yes; I have seen them in great quantities.

915. But we understand that they are never fished for ?—No.

916. Do you not fish for them because you do not think them worth fishing for ?—We never made a practice of fishing them. Nobody on this coast ever made a practice of trying for sprats.

917. They are saleable in other places, are they not ?—They may be, but they are not here.

918. Is there any shrimping here ?—Very little; there is not much.

919. Would it improve the fishing if any regulation such as fence months—certain seasons when people are not allowed to fish for certain fish—were established ?—I cannot say.

920. Do you think it would be better to allow you to regulate your own fishing ?—Yes, I think that would be the best way.

921. You have not been interfered with by any fishery officers ?—No.

922. Nobody has ever come to say that you were to make your nets this size or that size ?—No one.

923. Do you desire to have any such interference here ?—I do not know; we can have any kind of hole we choose now.

924. Do you think that that is better than having the mesh fixed at a certain size ?—We are not fixed now at all.

925. I know you are not, but do you desire to be fixed ?—No, it would not do at all.

926. A previous witness said he would like to have such a regulation ?—The general size we have in salmon trout fishing is 4 inches; the salmon net is a $5\frac{1}{2}$ inch hole.

927. Is there any regulation, do you think, that could be adopted, by which the supply of fish could be increased here ?—No, except these trawling boats were done away with; they are the proper ruin of Cullercoats; they are just taking all the fish off the coast, and if something is not done with them it will come to starvation among the fishermen.

928 And what do you think is the best way to remedy it ?—In my opinion the best way would be to knock the trawling boats off.

929. Do you not think there could be a proper limit established within which they might come ?—Yes, if they were kept outside the Dogger Bank.

930. (*Mr. Lefevre.*) That is where there is no fish? —There is plenty there, I believe.

931. You do not fish out as far as the Dogger Bank, do you ?—No, but we go as far as the 50 fathom waters. In the summer season we go with our long-lines to a depth of 50 fathoms.

932. But there is a considerable distance between that and the Dogger Bank, is there not ?—Yes.

933. Would you have no fishing there ?—No.

CULLER-COATS.

W. Scott.

22 Sept. 1863.

934. Then you would confine the fishing of the trawlers outside the Dogger Bank?—Yes; and then they would be out of the way of us altogether.

935. Do you think they injure you?—Yes, they take the small fish, and they get tons of them. Many of them are brought on to the deck all jumbled up together. They are tossed on the deck dead, and then they are tossed overboard.

936. Do they catch the fish you ought to catch, or do they spoil their own market?—They are catching the fish we ought to catch, and they are also spoiling their own market by catching small fish; they spoil their market by catching fish which is not saleable.

937. Have you ever been in one of these beam-trawlers?—No; but I have heard it said that the fish which comes in a trawl-vessel is not saleable.

938. What does it cost to buy one of the boats used here,—I mean one of the cobles?—Do you mean a big class fishing coble or a white line-fishing boat?

939. I mean a herring boat?—It would cost about 25*l.* or 30*l.*

940. And the nets, what would they cost?—They would require perhaps from 14 to 17 nets, and they would run about 3*l.* or 3*l.* 10*s.* a net, before they are put into the sea.

941. How many do you say?—Why some will have as high as 20 nets, some 15, and so on.

942. What does it cost to fit a man up in a herring boat?—I should say about 150*l.*

943. And what is the cost of a line-fishing boat?—That does not cost so much. You can get a good coble for about 20*l.*

944. What would the lines cost?—I cannot rightly say; perhaps every man's line would come to about 2*l.*

945. How many would they want?—There are three men and a boy. The boy has a half man's line.

946. What would it cost to set a man up with proper lines?—Do you mean with lines and boat together?

947. Yes?—Perhaps about 30*l.*

948. I presume it would cost a great deal more to set up one of these beam-trawlers?—Yes, a good deal more for the big ones.

949. You have none of those boats here?—No.

950. (*Mr. Caird.*) Do you ever see any mackerel off here?—Sometimes we see shoals of mackerel, but we do not fish for them at all. Occasionally they get in our nets.

951. What is the reason you do not fish for them? They are saleable, are they not?—Yes, they are, but we never make a practice of it. We have no mackerel nets. I believe a man named Nicholson has.

952. (*Professor Huxley.*) Do you ever catch mackerel with the hook?—Yes.

953. But you do not make a practice of it?—No.

The witness withdrew.

ROBERT CARR called and examined.

R. Carr.

954. (*Mr. Caird.*) Are you a fisherman?—Yes.

955. Are you a native of this place?—Yes.

956. I believe you chiefly deal with shell-fish?—Yes.

957. Do you fish shell-fish?—Yes.

958. And you also buy them?—Yes.

959. What kind of shell-fish do you catch?—Crabs and lobsters.

960. No oysters?—No.

961. Have you long been engaged in that business?—For about three years.

962. Have you been engaged as a fisherman much longer?—It is about 17 years since I first started.

963. During those years have you always been in the habit of fishing for shell-fish?—Yes.

964. Do you find that the number caught now is increasing or diminishing, as compared with what was caught in former years?—The lobsters are decreasing.

965. Are there many boats employed in the fishing?—Yes.

966. I mean in fishing for shell-fish?—Yes.

967. Do you know how many are employed?—There are different seasons, and the number varies.

968. But you think the number is increasing?—Yes, the number of boats is increasing.

969. And yet the quantity of shell-fish is decreasing?—There are more crabs caught, but there are more boats to catch them.

970. Are there more crabs than lobsters?—The lobsters are diminishing. They catch them when they are berry-fish,—in spawn.

971. And do they send them into market in that state?—Yes.

972. Do you think that that has a tendency to diminish the supply?—Yes.

973. Why do you not do the same with the crabs?—Because the crabs are of little value at such times; they have nothing in them.

974. Then you find that the crabs are not diminishing in supply?—No.

975. Is that because the spawn is not injured?—Yes, the lobsters have been decreasing ever since I was a boy.

976. Are they very much fewer?—There are very few now at all. A man may often go and fish and get none at all; in fact, in the summer, when the season was against it, there were none caught.

977. Is the crab fishery valuable here?—Not particularly.

978. Does the value of the fish come to much money in the course of the year?—No, they do not fish long for them.

979. Have oysters been found here?—No, I have seen small ones on a crab's back, but nothing particular to speak of.

980. (*Mr. Caird.*) Have you observed, in fishing for salmon, when the nets are 4 inches in the mesh, that sprats have sometimes been caught in those nets?—I have seen some hundreds in shore at a time in Tynemouth when we have been sweeping for salmon, and we have gathered them for bait.

981. (*Professor Huxley.*) That is when you have been using the net as a dragging net?—Yes.

982. Was there a great quantity of sprats caught in that way?—Yes, some hundreds; we might pick up three or four hundred for bait.

983. (*Mr. Lefevre.*) Do you know where the lobsters spawn?—I think they will spawn up the rocks.

984. They do not spawn far out, do they?—No.

985. (*Professor Huxley.*) Do you know the time of year at which they spawn?—No, I do not.

986. (*Mr. Lefevre.*) Do you believe that the beam-trawlers far out interfere with the lobster's spawn?—No, they cannot.

987. (*Professor Huxley.*) The lobsters carry the spawn along with them, and therefore it cannot be interfered with?—No.

988. In what depth do you catch lobsters here?—Ten fathoms. We do not catch lobsters here.

989. Do you know anything about the time at which soles, or turbot, or plaice spawn?—No.

990. (*Mr. Lefevre.*) What do you attribute the diminution of lobsters to?—I think it is owing to their taking the berry-fish and selling them.

991. Do you think there ought to be some regulation to prevent that?—I think they should be set away in May or June, when they are generally the fullest. If they are taken then they ought to be returned to the water.

992. Are they as good for eating then?—They are about the same.

(*Thomas Bolam.*) When a quantity of fish gets into the trawl net, it drags the meshes together, so

CULLER-COATS.

R. Carr.

22 Sept. 1863.

that any small fish that may have got in cannot get out again.

993. (*Professor Huxley.*) You mean by that, that as soon as the fish get in they pull the meshes together and no small fish can get out?—That is what I mean.

994. If you used a small mesh you would catch more fish, would you not. For instance, if the mesh were half an inch instead of 4 inches you would get a great deal more?—Yes.

(*Mr. Caird.*) We have now exhausted the list of witnesses which has been supplied to us, but if there are any fishermen in the room who desire to add anything to the evidence already given, or who wish to make any suggestion, we should be glad to hear them.

(*William Lyall.*) I wish to make an observation. I do not think it will affect the trawl making the meshes larger, because, if we make them larger the soles will go through. He is a fish which if once he gets his head through he will go right through very rapidly.

996. (*Professor Huxley.*) Does he bend his fins up?—Yes, he seems to bend them up altogether.

996*a*. A sole would not get through this (*showing a net*)?—A sole 6 or 8 inches would. If he once gets his head through his body would quickly follow after him, and if one finds his way out they will pack themselves, and all go through.

997. So you think that if the mesh were enlarged you would not catch any fish?—We might get haddocks, but the soles would go through, and then I do not think it would affect the small fish, because as soon as a weight of fish gets into the net the meshes are drawn together. A small sole would go through while a small haddock would not. With regard to spawning, I believe that the fish do not spawn in shore, but further out. About the month of May and June we get the ling with spawn in them, and I have got haddocks at that time with spawn in them.

998. (*Mr. Lefevre.*) Have you been engaged in trawling?—I generally follow the deep-sea fishing.

999. What do you make at that?—From 20*s*. to 30*s*. a week.

1000. Is that all you can earn?—Yes, on the average.

1001. Is that the average that a young man will earn?—Yes, but those who generally follow the small lines will not make that.

1002. How much do they make?—I cannot say.

1003. Does that include the herring season?—Yes; it includes the herring season as well.

1004. I believe you make a good sum of money during the herring season?—Yes; those who are fortunate do; 70*l*. or 80*l*. is considered an average season for a boat.

1005. And that is divided among three men, or three men and a boy?—Yes, or perhaps one man will get two shares.

1006. Do you think that you make better wages by fishing in this way than by going to sea as a sailor?—Yes, and we are our own masters; but I think we might get more fish here if we had a better harbour to come to. There are plenty of times when we might get fish at sea when we cannot get out over the bar.

1007. And do you see the trawling boats go in during bad weather?—Yes.

ROBERT BLAIR called and examined.

R. Blair.

1008. (*Mr. Caird.*) I believe you desire to offer us some evidence?—I am a sea pilot of the port of Shields, and I think I am able to give you some evidence. I think I am able to tell you something as to the practice of fishing on the north-east coast. I can say this with regard to trawl-net fishing, that I have been practised in the pilot line for the last 30 years, and I have had the privilege of examining the various stations that the trawlers have taken up from time to time up to the present time. When I was a young man, say 25 years ago, these trawlers were not known to fish between Rawcliffe and here; that is, on the Yorkshire coast; since that period they have got down as far as the Tees. For the last 10 years they have fished between there and Seaham, and from Seaham they have now got down as far as Sunderland, and from Sunderland they have got as far as Cullercoats, and even north of Cullercoats. It is evident, according to what I see and understand, that if these trawlers go on fishing with their trawls, the whole of the fishing on the north-east coast will be totally destroyed; and the information I have received from fishermen belonging to Hartlepool, Whitby, and other ports, leads me to believe that the in-shore fishing is entirely done away with, and that the fishermen have no possibility of making a living with their short line fishing along the coast. They say that they have now to go further off the land to attempt to gain a living, and to supply the public market with good wholesome food; and I must say that their efforts have failed to a great extent, for wherever they have gone the trawlers have followed them. Indeed, I have been towing astern of a trawler when the nets have been pulled up, and I have observed the spawn come up in the nets. I have seen the nets almost full of spawn, some of it of a dark red colour, some of it a pale red, some of it blue, and part of it of a salmony-coloured red. I have asked the master of the smacks what was the cause of the difference in the colour of the slime that came up in their nets, and they told me that the spawn which came up of one fish was of a different colour from that of another. They explained to me how it was that the different colours of the spawn belonged to different kinds of fish, but I am not qualified to give you the information from my own personal knowledge. They showed me certain portions of spawn that came up as big as your fist, or thereabouts, and they told me that their trawl net went over and destroyed the spawn; of course, there must be millions of fish destroyed. That is all I know, except that they have got down as far as this place. I think it is quite as possible for an aerial machine to be passed over Great Britain, and to drag all over the land without doing injury, as for these trawlers to continue their fishing on the north-east coast without destroying the fish.

1009. (*Mr. Caird.*) Will your experience enable you to say whether by the gradual advance of the trawlers northwards the in-shore fishing has been diminished?—Yes, I believe it has.

1010. But do you know it?—Yes, I believe it has. When I was a young man, 20 years ago, any two men could take a small boat and go off and get a load of haddocks in a forenoon and come ashore with them. There is nothing of that kind now.

1011. May not that be accounted for by the fact that there are a greater number of men employed?—No, I think it is because the spawn of the fish, which amounts to millions of young fish, is destroyed.

1012. Are there not at the present day a greater number of men employed in fishing than there were when you were a boy?—I believe there are perhaps two-thirds more, but at that time I could get a large haddock for twopence, and now I have to pay upwards of ninepence for one.

1013. You tell us that the trawlers began by coming a certain distance along the coast, and that then in the course of a few years they got a certain further distance, until at last they arrived off Cullercoats; do you know whether, as they have advanced northwards, the people who fished with the lines have been injured in their fishing?—Yes.

1014. Do you know that as a fact?—Yes; I know that at Hartlepool the in-shore fishing has been entirely destroyed by the trawlers. The fishermen cannot get any fish in-shore at all.

1015. How long ago is it since that injury was first done?—Perhaps about 10 years. Since that

CULLERCOATS.

R. Blair.

22 Sept. 1863.

period they have gone across the Tees to Seaham, and they have come now as far as Cullercoats.

1016. Have the fishermen there discontinued fishing?—No, because they cannot live without it.

1017. But the fishing is not so productive?—It is not nearly so productive.

1018. (*Mr. Lefevre.*) When you say that these trawlers have drawn up to the north, do you mean to say that they have deserted the south, or only that they have increased in number?—I believe the trawlers have increased very much of late years. According to my recollection, there used to be not more than five or six off the Tees, and now there are more than 30.

1019. Do they sail from the Tees?—No, from different parts. I know that there is a greater number of them than there used to be formerly. In pulling up towards the Tees I have seen as many as 30 sail of them, and for the last 10 years they have been gradually increasing. They have come down north from Seaham to Sunderland, and from Sunderland here.

1020. You do not say that they have deserted the ground off the Tees; they still continue to trawl there, do they not?—They do not now. I have been several times there and I scarcely see one there now.

1021. (*Mr. Caird.*) You say the trawlers came first off Hartlepool, and that since then they have come further north and north?—Yes.

1022. Did they remain off Hartlepool for any length of time?—No, not long. I believe they have cleared that ground.

1023. Do you believe that there is no fish being trawled for south of Hartlepool?—I do not believe that there is that quantity being trawled south that there is north. There is one remark I should like to make, and that is, that some of our fishermen have stated that there is a small net fishing practised on the north-east coast with regard to old men. Now they only go to this work when they are not capable of prosecuting the deep-sea fishing, and when there is no possibility of the trawlers coming into their water. The nets the trawl-smacks carry would bear no comparison with them. The small coble is only 18 feet in the keel, and can only drag a very small net, and work in a very small depth of water; consequently there is no possibility of their doing any injury there, because we do not believe that any fish of any kind will spawn in water only three or four fathom deep; they must spawn somewhere where the commotion of the water will have no effect upon them.

The witness withdrew.

T. Bell.

THOMAS BELL called and examined.

1024. (*Mr. Caird.*) Have you had much experience of Cullercoats as a fishing station?—Yes, for the last 52 years.

1025. In your experience have you noticed that there has been a change in the quantity of fish caught here?—I can recollect when there were only seven boats, and they would bring in seven cartloads of fish each per day.

1026. Was that an average take?—Yes. I have known sticks put up the sides of the carts to hold the fish in; ling and turbot and so on.

1027. How long is that ago?—About the year 1816.

1028. (*Mr. Lefevre.*) Were they extraordinary takes or were they of every-day occurence?—There were two boats which had nine cartloads of haddocks and different kinds of fish.

1029. (*Mr. Caird.*) What would be the weight of a cartload of fish?—I have seen all the men hailed to shove them up the bank. There would perhaps be near a ton.

1030. Do you think that all the boats now engaged do not bring seven cartloads of fish ashore now?—They do not bring the half of it.

1031. How many years back is it since the diminution in the quantity caught began to take place?—I should think it has been within the last 20 years.

1032. Has it been decreasing gradually within the last 20 years?—Yes, all the time.

1033. There has been no sudden decrease during that time?—No, it has been a gradual decrease.

1034. When did the trawl-boats first come?—I cannot say.

1035. You have not observed them very long, have you?—No, not until lately, and since then there has been the decrease I spoke of.

1036. Have you observed whether the size of the fish has decreased?—Yes; the cod are not so large as they used to be.

1037. And the haddocks?—I could get a haddock the length of that (*measuring*) for a penny.

1038. And you seldom get haddocks that length at all now?—Not often.

1039. (*Professor Huxley.*) Does your impression about the decrease of the fish apply to the herrings as well as to other fish?—As a proof that the fish never are so cheap now as they were then, I have known them at 3*s.* 6*d.* a thousand.

1040. How long ago is that?—Twelve or 14 years ago.

1041. Might not that arise from the want of a sufficiently large market. The price of herrings you know will go down when there is a great take?—But the railway was open then.

1042. Do you think there has been a decrease in the take generally?—Yes, I think so.

1043. Do you think it has decreased in the same way as the white fish and cod?—Yes.

1044. Then you think that all the fish have decreased together?—Yes.

1045. Are you aware that the cod, whiting, ling, and other fish all feed on herrings?—Yes, as a proof of that they always take cod when they are fishing for herring.

1046. Then do you not think that the diminution of herrings may to some extent account for the diminution in the other fish, seeing that they have not had the same supply of food?—I cannot answer that.

1047. (*Mr. Lefevre.*) Do you take into your consideration the quantity of fish caught by these trawl-boats?—I have no knowledge of them at all.

1048. You merely look to what is caught off the coast and brought here?—Yes.

1049. Are you aware that large quantities of fish are caught by the trawlers off this coast?—Yes, I have heard it mentioned by our people.

1050. I suppose you think that ought to be taken into consideration in estimating the increase or diminution of the fish caught off this coast?—Yes, it ought to be.

1051. (*Professor Huxley.*) How long have you known this place?—For 52 years.

1052. And have you been intimately acquainted with the condition of the people?—Yes, I have been thoroughly acquainted with their condition.

1053. Are you a tradesman here?—Yes.

1054. Do they keep accounts with you?—Yes.

1055. Then you will have good means of knowing?—Yes.

1056. From your observations during the last half century, do you think they live as well as they used to live?—I do not think that they do.

1057. Then you do not think that the increase in the price has made up for the diminution in the take?—No.

1058. Is there much pauperism here?—The poor rates are a shilling in the pound.

1059. Do you know how many people are in the receipt of relief?—No.

CULLERCOATS.

T. Bell.

22 Sept. 1863.

1060. I suppose we can obtain accurate information as to that ?—Yes.

1061. Do your accounts run over for two or three years sometimes ?—Yes.

1062. Are the people temperate ?—Yes, more so than they were formerly.

1063. That is to say, that when they got plenty of money they spent it on the Saturday nights ?—Yes.

1064. (*Mr. Lefevre.*) Do you know the general rate of wages paid here ?—No, they do not fish on wages, so I have no idea.

1065. Do you know what a man can earn in a week ?—No, that would be rather difficult to get at.

1066. Do you think 30 or 40 shillings a week is rather a high figure, or would their earnings average that ?—I think that if they got that they would do.

1067. (*Professor Huxley.*) How is it then that the men obtain capital for their boats. For example, a herring boat will cost 100*l.*?—No, it will not cost as much as that; I should say 50*l.*

1068. But you know the boats have increased of late years ?—Yes.

1069. Then the capital for fitting them must come from somewhere; how do they get it?—A good deal of it has been got and never paid for.

1070. Has it been advanced by merchants and traders and never redeemed ?—Yes.

1071. (*Mr. Lefevre.*) Still the fact remains that the number of boats has increased and that the capital has been advanced ?—Yes.

1072. (*Professor Huxley.*) Do you think that a portion of the capital advanced upon these boats has been a loss ?—Yes, I know it has been to me.

1073. (*Mr. Caird.*) Has the condition of the people themselves rather deteriorated than otherwise ?—No.

1074. It has not ?—No.

1075. (*Professor Huxley.*) Are they worse off than they were ?—I think they are.

1076. (*Mr. Caird.*) Is there any legislative enactment or other means by which you think the supply of fish could be increased here ?—I cannot say.

1077. (*Professor Huxley.*) Do you think that trawling does sufficient damage to justify the interference of the legislature ?—Yes, I should say so, judging from the reports the fishermen make.

The witness withdrew.

Thomas Hutchinson Pyle called and examined. *T. H. Pyle.*

1078. (*Mr. Caird.*) You are a medical man, Mr. Pyle ?—Yes, at Hursley, near here.

1079. Have you been acquainted with the condition of the people of this village for some time ?—I have.

1080. Have you observed whether it is improving or deteriorating ?—I think the condition of the inhabitants was much better formerly than it has been lately.

1081. Has there been any recent material decline in their condition ?—Not that I am aware of.

1082. Are the people here on the whole comfortable and well off ?—Their habitations are not very good; their cottages are very small, and so on.

1083. Are they worse than they were ?—I think not.

1084. (*Mr. Lefevre.*) I suppose the cottages are the same they have always been ?—I think they have somewhat improved.

1085. (*Mr. Caird.*) To whom do they belong ?—Some of them belong to the Duke of Northumberland, but Mr. Brown, a grocer, is the principal owner. With regard to fish, I may say that there has been a great falling off both in the size and quantity. I used to be very fond of going down occasionally and looking at the boats when they came to the shore, and I noticed the large numbers of cod and haddock that they used to bring ashore. I have fancied lately that there could not be as good fish in the sea as there used to be, or that if there are our men do not get them.

1086. (*Mr. Lefevre.*) Do you know what wages the men will make ?—No, I have no means of knowing that.

1087. (*Professor Huxley.*) What is the rate of mortality here ?—It is not much greater than at other places. I should say it was rather below the average.

1087. What are your principal diseases here ?—They are principally epidemics.

1088. Have you fevers ?—Occasionally.

1089. Do you have typhus ?—Not much.

1090. Have you had cholera here ?—It was very bad in 1832.

1092. It was bad everywhere then, but is this a place that is visited by cholera ?—Not particularly so.

1093. Is the drainage good ?—It has improved lately.

1094. As to the mode of living, do you know whether *delirium tremens* is of frequent occurrence here ?—Not so much as formerly.

1095. How many cases will you see in a year ?—I very seldom see a case of that kind, but I do not come so much as I did before.

1096. From what you have observed, do you think that the people here live less comfortably than they did 10 years ago ?—I think not. There are great complaints that they do not get so much money as they used to get.

1097. Is there a noticeable difference in the mode of life or in the comforts of the people ?—They complain that they cannot get on as they used to do. They cannot pay their bills, and they do not earn as much as they used to do.

The inquiry was then adjourned until Wednesday, the 23rd September, at Newbiggen.

Newbiggin, Northumberland, Wednesday, 23rd September 1863.

Present:

James Caird, Esq., M.P. (Chairman.) | Professor Huxley, F.R.S.
G. Shaw Lefevre, Esq.

NEWBIGGIN.

William Dawson called and examined. *W. Dawson.*

23 Sept. 1863.

1098. (*Mr. Caird.*) Are you a native of this place ?—Yes, I am, born and bred.

1099. Have you been long engaged in the fishing business here ?—I have been engaged in fishing for upwards of 50 years.

1100. Can you tell me what are the different kinds of fish caught on this coast ?—There are cod, ling, turbot, haddock, sole, skate, herring, mackerel (not much mackerel), and several other kinds of fish.

1101. Are there any shell-fish, any crabs and lobsters ?—Yes, we have both crabs and lobsters.

1102. Are any oysters caught off this coast ?—No, there are no oysters.

1103. Are you still a fisherman ?—Yes.

NEWBIGGIN.

W. Dawson.

23 Sept. 1863.

1104. You are still yourself engaged in fishing?—Yes, but I do not follow deep-sea fishing so much; I only follow in-shore fishing now.

1105. Is that for crabs and lobsters?—Yes, and soles.

1106. Do you trawl for soles?—No, I fish them with the hook and line. We have not used trawls for several years now.

1107. Has the number of fishermen and boats employed in the fishery here increased or diminished within your memory?—They have increased a deal.

1108. How many boats were there employed 50 years ago?—Not so many as are employed now.

1109. How many?—There were not above eight out of Newbiggin in 1808. Three were lost in that year. In the herring fishery there is a larger number, but not so many in the winter time.

1110. How many boats are employed in the fishing now?—I believe there are now about 30; perhaps about 26 go to the haddock and cod-fishing; there are upwards of 40 engaged in the herring fishery.

1111. Were the boats about the same size 50 years ago as they are now?—No, they were not more than half the size they are now, and not so much as that.

1112. Were they manned by the same number of men?—Yes, except that they have a boy extra in the winter now.

1113. Were they manned by three men?—Yes, three men then, and three men and a boy now.

1114. (*Mr. Lefevre.*) There are two men only for the herring fishery. Is not that so?—Formerly there were only two, but now there are three.

1115. (*Mr. Caird.*) Did the boats in the winter time carry as many lines as they do now?—I think they carried nearly the same, but at that time they were not quite so large as they are now.

1116. And when they were going to the net fishing had they as many nets as they have now?—No, not so many; not one third part of them; but they could hardly have carried what they carry now. The boats now used are much larger. The boats used at the time I have been speaking of were scarcely large enough to carry the number of nets they carry now.

1117. You say the boats now carry three times as many nets as they did 50 years ago?—Yes, fully three times as many.

1118. In your experience have you noticed whether the quantity of fish taken by each boat has increased or diminished of late years?—The quantity of fish taken has decreased greatly.

1119. The fish have fallen off, have they?—Yes, they have, especially within the last few years.

1120. Let us speak first of the white fish, not the herring; have they decreased of late years?—Yes, by a very great deal; in 1812, on the 14th of December, which well I remember, I was going to sea on that day, every boat that went off returned loaded with haddock and cod, but there were far more haddock than anything else. There is not a boat living that gets as much now. I am speaking now of 51 years ago.

1121. Then a boat 51 years ago brought in a much heavier load of fish than a boat brings in now?—They brought in as much as they could carry, as much as a cart could carry away.

1122. Was that a regular thing?—I had two brothers lost at sea on the same day. That circumstance makes me remember the date very well. The day before they were lost every boat was loaded with fish.

1123. But what I want to know is this, was that better than a usual day's fishing, or had you such large takes regularly?—Why that was just a common thing then; the boats, however, were small. When we had fine weather we had large takes of fish. In stormy weather the boats did not all get their lines out; if they fished at all they had to fish nearer in shore.

1124. But it is the same now, you have stormy weather as well as fine?—Yes, but there is not as much fish to get.

1125. Having better boats now, do you go more often to sea than you did then?—Our boats are much superior to what they were at the time I am speaking of, but I do not think we go oftener to sea. With regard to the little boats, I think we could handle them better when they were less than we can now.

1126. Then what I understand from your statement is, that a boat half the size brought in a much larger quantity of fish fifty years ago than a boat of the present day?—It brought in quite a superior quantity altogether.

1127. Have you observed any difference in the size of the fish caught now as compared to what they were at the time you speak of?—I think there is very little difference in the size, at the same time I think they are a little smaller; there are more caught young now.

1128. Is there any particular kind of fish that is fallen off more than any other?—There are some kinds which I believe are fallen off very greatly. The haddock-fishing and even the herring-fishing has very much diminished.

1129. Are the haddock of as good a size as they used to be?—I consider that the haddock is a fish that spawns on the coast, but it varies very much, it comes backwards and forwards with the storms and the tide, and sometimes we get much larger fish than we do at other times. For instance, it may be a good spawning season this year for fish; the next year you will see small haddock, but there will still be some large ones among them; the large ones will be those that were spawned a year or two before. They will get mixed up in that way.

1130. But you have noticed no perceptible falling off in the size of the fish caught. The falling off, so far as you have observed it, has been only in the quantity?—It has not been so much in the size, only in the quantity. There has been a great deal of difference in the quantity.

1131. With regard to the cod, are they on the average as good in size as they used to be?—I think they are just about the same, but they are vast scarce to what they were. We have got as many as 100 cod-fish a day on our small lines which we used to catch haddock with, now we cannot get half a score; there is that much difference.

1132. With regard to the herring fishery have you noticed any falling off in the quantity of herring caught on this coast?—Perhaps there may be as many herring caught, but it must be remembered that there are six times the number of boats engaged in catching them.

1133. You think on the whole there are as many caught?—There are nearly as many caught among the whole boats, but in my day there were not one-tenth of the number of men employed in catching them as are employed now.

1134. You think that the small number of men employed then caught as much as the whole of the men employed now?—Yes, and if they had had the nets then which they use now they would have caught a great deal more. There are men sitting here in this room who caught as many then in one boat as are caught now by all.

1135. Does not the herring-fishing vary very considerably year by year?—In some seasons we get them better than at others.

1136. But there is no perceptible falling off lately in the quantity caught?—I think they have diminished a great deal.

1137. When did they begin to diminish?—I should say they have fallen off during the last 10 or 12 years, or perhaps even more than that. I think they have gradually turned worse.

1138. You think they have fallen off within the last 12 years?—I should say so; perhaps it may be more than that, say 20 years.

1139. The yield for each man has got worse, but the total yield continues the same?—Yes, that is through having more boats to catch them.

1140. Now, with regard to mackerel, do you fish

mackerel here?—We catch very few mackerel; we have no proper mackerel nets in Newbiggin. We only take them in our herring nets, or we go hooking for them. We have not sufficient nets for them, and we only get the straggling ones which get entangled in our nets. Some people go out with the line and fish for them, but they are not regular fishermen.

1141. Do considerable shoals of mackerel come off here?—There are large quantities at times, but we have no nets to catch them. We have no mackerel nets here.

1142. Are there any sprats on this coast?—There are plenty of sprats at times, but nobody catches them except the children.

1143. I understood you to say that you do not trawl for soles here?—No, we do not trawl for them; we fish for them with hook and line. They may trawl for them sometimes, but it is not very often. I believe there has been only one boat this season trawling for soles.

1144. Have you any idea of the cause of the falling off in the quantity of fish caught?—I cannot account for it except it is in consequence of their having been destroyed so much south of this place. The fish used to shift backwards and forwards in stormy weather and heavy tides, but as they are all caught now in the south of course they have no chance of coming back again.

1145. You do not think they are caught off this shore?—They may be by the smacks, but it is only within the last few years that the smacks have come on this coast at all.

1146. Did you ever see any of the trawling smacks on this coast before last summer?—No, they never came here before. I do not know that we could perceive any evil to us last summer.

1147. Do you notice them doing any evil now?—Yes, some men have lost their lines and tackle through them.

1148. Do they come on the same ground as that on which you fish?—Yes, they do, and they sweep away our lines.

1149. How far do you go out?—We go out as far as from 12 to 14 miles from the shore.

1150. You say that the smacks trawl over the same ground?—Yes.

1151. Did you never object to their coming on this ground and interfering with your lines?—We have never challenged them with it because our lines reach three miles in length, and when they trawl our lines away at one end we may not be near hand to see them.

1152. You say that your lines reach three miles in length?—Yes.

1153. Are they set across the tide?—Yes.

1154. Are they buoyed up on the surface?—There is only a buoy to every mile.

1155. Then you have three buoys on the full length of line?—Yes, and two in the middle. At one mile we put on a buoy, at the end of another we put on another buoy, at the next mile we put on another, and we steer by it until the line is fished.

1156. Does everybody that goes out from this place carry lines of the same quality and the same length?—Yes.

1157. Do they shoot in parallel lines?—Yes, quite in parallel lines.

1158. What distance will there be between the lines?—They should be about a quarter of a mile apart, but sometimes they get nearer hand, and if they get on the ground they may drag together.

1159. (*Mr. Lefevre.*) You say they are set a quarter of a mile apart?—No, I only say they should be. It is necessary they should be at that distance apart in order to have a fair cast of the sea for fishing.

1160. (*Mr. Caird.*) In talking these matters over here among other fishermen, is there anything that has occurred to you that ought to be done, in order to prevent this continued decline in the supply of fish?—I think we can do nothing for it unless we could get these trawl-vessels stopped.

1161. But the trawl-vessels came here only last year?—Yes, but we never get any supply now. We used to get a vast of fish, and now we never get any except they come from the north side of us. The storms used to send in a large quantity of fish.

1162. You get more from the north after storms than from the south?—We never get any fish now unless the storms send them in from the north, from that side which is not fished by the trawlers.

1163. You used to get fish after a south-east storm?—Yes, we did.

1164. And you do not get fish after a south-east storm now?—No, the weather makes them worse; still we get fish after a north-east storm.

1165. Then you prefer a north-east to a south-east storm?—We think a north-east storm is best for us.

1166. Do you notice any very perceptible difference in the quantity of fish which follow a north-east or a south-east storm?—Yes, we never look for any after a south-east storm now.

1167. When did you begin to give up looking for them after a south-east storm?—Perhaps it may be 20 or 30 years since.

1168. And within your recollection, which goes as far back as 50 years ago, did you find that as many fish used to come in with a south-east storm as with a north-east storm?—An old mate of mine told me there were far more after a south-east storm than after a north-east storm.

1169. But was that so within your own experience?—I know there were fully as many.

1170. (*Mr. Lefevre.*) Are you talking now of the herring or of the white fish?—I am talking of the white fish, not of the herring. It has nothing to do with the herring fishing. At the same time we prefer a north-east storm at Newbiggin for the herring-fishing.

1171. (*Mr. Caird.*) Does anybody interfere with you to regulate the size of your nets or lines? Are you required by anyone to have your nets of certain dimensions?—Nobody interferes much with us in that respect.

1172. Does anybody tell you that you are to have them either this or that size?—A man comes about, I believe, and he reckons us to have 36 meshes to the yard, but I daresay he never interfered and took any away.

1173. Then within your recollection there has been no interference with regard to the size of your nets and the size of your lines, or the time of year at which you should fish?—No.

1174. Have you any fixed close time?—We have different seasons for different fish; the fish come here at different times.

1175. That is not what I mean. Does anybody come here to regulate your fishing?—No.

1176. Do you think it would be of advantage if the Government were to do something of that kind?—I do not suppose but what it might be of some advantage.

1177. Perhaps you would be kind enough to tell me what would be the advantage?—Why, if the Government would make a law that from sunrise on Saturday morning to sunset on Monday there should be no fishing, I think that would be a very great advantage to the herring fishing. I think it would be a very great advantage indeed.

1178. Is there anything else that the Government might do?—If they would make a law that would prevent both Frenchmen and Englishmen from fishing from Saturday morning till Monday evening, that would be about 60 hours, and would give the shoals time to draw together. They get very much broken up in consequence of being fished among both day and night. They get so much broken up that they cannot get together again. I think the want of some such regulation as that is one of the causes why the fish have been diminishing on this coast.

1179. Do you think it necessary that there should be a close time also for white fish?—No, not in the case of white fish.

NEWBIGGIN.

W. Dawson.

23 Sept. 1863.

1180. Is there any other point in regard to which you think the Government might interfere with the prospect of increasing the supply of fish here?—I cannot say that there is. There is nothing else they could do except they could stop these herring vessels, or confine them to their own coast. In 1829 I applied for a licence, and I had a boat or two built, but they would only allow us a licence to fish over a certain distance, 24 miles from the land between Whitby and Holy Island; that was the only distance I was allowed to fish.

1181. Are you at all interfered with by the French fishing boats?—We are terribly interfered with by them at times; they do not mind us a bit.

1182. Have they been here this year?—Yes, they have.

1183. Did they do you any injury in your fishing?—They did not do us so much injury this year as they have done in other years, but still there have been persons injured this year.

1184. Did they come in on your fishing grounds?—Yes, if they see us here they fly off to us together. They come among us just as they like.

1185. Do they know that they should not come within certain bounds?—They know very well that they should not come within three miles of the land.

1186. Do you catch your herring within three miles of the land?—Most of it we do.

1187. Is a large proportion of the herring caught off your shore caught by the Frenchmen? Is a half or a fourth so caught?—They get more than most of our boats get. The French may have had 300 sail on this coast this season, and each vessel will be upwards of a hundred tons burden; most of them I believe have gone home loaded with fish.

1188. I suppose these 300 have not been exclusively on this shore, but have been going about all along the coast?—Yes, they have been fishing all along the coast; they have been shifting along as the herring shifted. They are fish that seldom stay long in the same place. The herring in general comes in on the north coast.

1189. You have been speaking of the whole fleet of French fishing vessels?—Yes, on this coast.

1190. And you think that that fleet of 300 vessels has caught as many fish as the whole English fishermen on this coast?—Well, I do not quite believe that, but they have caught a large quantity. It is not so much what they catch as the way in which they interfere with our fishing. I think they shoot their nets far too soon; there should be no nets in the sea till the sun sets, because they frighten the fish away.

1191. Then do you think it would be a good rule for the Government to establish that no net should be shot until sunset?—Yes, that would be a very good rule indeed.

1192. That herring nets should not be shot till sunset?—Yes, and they should be out again before sunrise.

1193. Is it your custom and the custom of fishermen here never to shoot your nets until after sunset?—We very seldom shoot them till after sunset, unless the fish are very thick together.

1194. And do you find that the French fishing boats shoot their nets without waiting till sunset?—Yes; they constantly shoot them before sunset in order to keep us off the ground.

1195. In order to get possession of the ground?—Yes, for then we cannot shoot as near them as we ought to do; we have nothing but bullocks' bladders for buoys, and they have kegs and barrels.

1196. When the fishery cutter comes round do they decamp and go away?—When any of the Queen's cutters come round they fly off directly.

1197. And they go outside?—Yes, they go more than three miles off the land; but when the vessel goes away they come in again and shoot their nets.

1198. Are you able to state whether shell-fish—crabs or lobsters—have been increasing or diminishing on this coast?—I believe they have diminished a little—the lobsters, not the crabs.

1199. What is the cause of the lobsters diminishing and not the crabs?—I think the lobsters are more taken.

1200. Does it pay better to catch lobsters?—We catch lobsters nine months in the year; we only take crabs for two months.

1201. Then you think that the lobsters are too much fished, and that they are consequently getting scarcer every year?—Yes, I certainly think so; and they have got a different method of catching them.

1202. Do you think that a boat's crew now, in consequence of the increased price of fish, make as much money by fishing as they used to do, when the price of fish was much less?—I do not think that they make as much money now.

1203. Do you think that a fishing boat and crew do not earn as much as they did 30 or 40 years ago?—I do not think they do.

1204. Are the people not as comfortable in their houses, or in their mode of living, as they used to be 30 or 40 years ago?—Their lodgings are a deal better, and they are provided with far superior accommodation.

1205. But you think they do not earn as much money in the course of a year as they used to do?—I do not believe they do.

1206. Can you give us any statement as to what a fisherman would be able to make 40 years ago?—I had a statement of my own as to what I earned in one year. I earned 126*l.* my own self during the whole of a year. The last time I took any account I found I had only earned 78*l.*

1207. Are you speaking of one man in a boat?—Yes, just one man.

1208. And these are the sums that you earned in the course of a year?—Yes.

1209. The first sum was 126*l.*?—Yes, and I kept an account for another year, in which I found I had only made 78*l.*

1210. In what year did you earn 126*l.*?—It would be about the year 1825.

1211. Was that about the average earnings of a fishermen at that time?—No; I believe I had about the best boat at that time. Some would not get half as much as I did. I would not have given my share for some two men's share; but their tackle was not so good as mine.

1212. In what year was it that you made the second calculation?—I don't remember the year.

1213. Was it within the last five or six years?—No; it will be more than that back.

1214. (*Mr. Lefevre.*) The year in which you earned 126*l.* was an extraordinarily good year, was it not?—Yes; it was the best year of which I had ever kept an account. I have had very few better years than that; it was the year 1825.

1215. (*Mr. Caird.*) Can you give us any idea of what your average earnings were 30 years ago?—The best idea I can form is that I might have made somewhere about 100*l.* a year.

1216. And what, on the average, have your earnings been during the last five years?—During the last five years I have not made 20*l.* a year.

1217. But perhaps you are not as able now as you used to be?—In point of fact I am not following the same fishing.

1218. Then it is not a fair comparison to make?—No, it is not.

1219. Cannot you give us something that would be a fair comparison?—No, I cannot exactly say; but I believe there are none of them now at the white-fishing who will make 50*l.* a year; but then they have the herring-fishing besides. They may make another 50*l.* at the herring-fishing.

1220. (*Professor Huxley.*) When you earned 126*l.* was it made principally by the herring-fishing or by the white-fishing?—It was just the white-fishing the year round.

1221. Did you make most out of the herring or out of the white-fishing?—I made most out of the white-fishing.

1222. You were saying that the long-lines are supported by buoys?—Yes.

1223. How big are the buoys?—They are just the size of a sheep's skin.

1224. The size of a whole sheep's skin?—Yes; it is gathered together. It comes round by being tied together. It sticks up six feet high, so that it can be seen two miles off at sea.

1225. Then buoys so large are placed about a mile apart?—Yes. They are placed upon our lines, and perhaps a neighbour's buoy will be not a quarter a mile apart from mine.

1226. Still the buoys are so large that the trawlers cannot help seeing them?—They can see them very well in daylight. The line is lying at the bottom of the water, and when the trawlers sweep in they catch the line and drag it away.

1227. But suppose the trawlers wished to avoid the lines, can they always make sure where the lines are by noticing the buoys?—Yes.

1228. Then if the trawlers were to say that the buoys were so small that they cannot see them their statement would not be true?—If they chose to look for them they certainly would see them. They would not do so, however, at night, and there is a vast of trawling at night.

1229. There is a good deal of trawling at night?—Yes, if they trawl they trawl at night. They never came till last summer on this coast, and I cannot give much information about them.

1230. (*Mr. Lefevre.*) Is your line-fishing at night?—We go very soon in the morning.

1231. (*Professor Huxley.*) Then your great complaint against trawling operations is not that they destroy the fish, but that they take away your lines?—They both destroy the fish and take away our lines.

1232. They do both?—Yes, and they must be kept along their own coast, or done away with altogether, or the fisheries of England will soon be exhausted.

1233. Then I understand that you object to trawling on two grounds: in the first place that it destroys the fish, and in the second that it takes away your lines?—Yes, there is great destruction to the fish, and they also destroy our tackle because they trawl away over our lines, and if they get hold of them we are sure to lose them. The line will break away perhaps half a mile from where they have caught it. It is gone directly, and we never see it again unless some one falls in with it on his lines.

1234. You said that the number of fishermen in this place has increased within the last 20 or 30 years. I think you said it had doubled or trebled?—Yes.

1235. Has the number of boats increased also?—Yes.

1236. What does a new boat cost?—We generally give about 20*l.* for a small boat fit for the line-fishing, and about 30*l.* for a boat such as we use in the herring-fishing.

1237. Does that include fittings?—No, only the hull. With the fittings it would cost nearly double that.

1238. Then it would be 40*l.* for a boat used for the line-fishing, and 60*l.* for a boat used in the herring-fishing?—60*l.* would not fit a herring boat out.

1239. Then shall I say 70*l.* or 80*l.*?—I think it will take 100*l.* at least to fit a herring boat out with full tackle.

1240. That is a good deal of money is it not?—And even that sum is rather low. I think no man can fit a herring boat out for 100*l.*

1241. You say the number of these herring and long-line boats has increased three or four times over within the last 40 or 50 years?—Yes.

1242. Then how have the fishermen got the money to fit out the new boats?—They have done it partly out of their own earnings and sometimes they have found a friend.

1243. (*Mr. Lefevre.*) Where do you remain with the boats when your lines are out?—We set our lines and then we stop at the last buoy.

1244. Until you begin to haul in the line?—We stop for about three quarters of an hour. We stop as long as we think there is any bait remaining on the hooks, and then we draw in the line back again over the same ground.

1245. (*Professor Huxley.*) You say that the men get the money for the new boats partly out of their savings, and that it is partly money advanced to them by their friends?—Yes.

1246. I presume that the people who advance the money will want some return for it?—Commonly they do.

1247. Then the fishermen must have earned enough to pay for the expense of their boats in some way or other?—Yes, some of them.

1248. So that if they have saved enough to double or treble the boats during the last 50 years they must have saved a good deal of money?—I consider they have saved no money at all.

1249. Then how do they get their boats?—They got them to keep their living good. I have had a few boats in my lifetime but I have had no money. As soon as I had got 20*l.* or 30*l.* saved I have had to buy a new boat.

1250. The money has been saved?—Yes, to a certain extent.

1251. Do you lose much fish upon your lines in consequence of its being spoiled or destroyed?—We lose a good deal by the dog-fish; they destroy great quantities.

1252. Does it often happen that you take up your lines and find nothing but the heads of fish on them?—That is when the dog-fish are plentiful. There is also another kind of fish that destroys a great deal; it buries itself in the fish, leaving nothing but the skin.

1253. What will a man lose in a night; how much will he lose by the dog-fish and suckers on the average?—I cannot say.

1254. Do you suppose he would lose one third?—Sometimes I have lost a whole shot.

1255. And sometimes you have lost none at all?—Yes, sometimes none.

1256. Can you give a notion of what your loss is commonly?—No, I cannot give an estimate of that.

1257. Do you happen to know when the haddocks spawn?—Yes.

1258. At what time do they spawn?—They spawn in the month of February or March, the latter end of February or the fore part of March.

1259. When do the flat-fish spawn; plaice and soles?—About the month of June.

1260. When do the turbot spawn?—About July; I think it is about that time.

1261. Do you have herring here in the early winter, say in December or January?—They are here, but there are none fished for. We used to fish them formerly, but since we have got larger boats we cannot manage them.

1262. Did you ever catch them in January or February?—No, but I have caught them in December.

1263. Were they full fish then?—They were fine fish.

1264. Were they getting full?—No, they were not full.

1265. Have you ever seen full fish here about January or February?—No, I cannot say that I have.

1266. Then you never caught any at that time?—No, I have never seen them full at that time that I have taken any notice of it.

1267. Are you sure they are here in January or February?—Yes, I am sure of it.

1268. (*Mr. Lefevre.*) How far does the fishery of Newbiggin extend along the coast?—It extends no distance now. We have no licence now; no licence is necessary.

1269. How far do you generally fish?—To Emmanuel Head.

1270. How far do the fishing boats from here generally go?—They go from Tynemouth Castle to Dunstanborough Castle.

NEWBIGGIN.

W. Dawson.

23 Sept. 1863.

1271. Where do they meet the Cullercoats boats generally?—Between Cullercoats and here.

1272. Then northwards how far do you go?—I cannot say positively; perhaps they stop at Hartley.

1273. I understand you to say that you recollect the fishing here for the last 50 years?—Yes.

1274. Has the increase of the boats been gradual from that time to this?—Yes, it has been gradual. The rising generation increases the boats.

1275. Do you recollect the time when no Frenchmen came off the coast?—Yes, I recollect when there were none at all.

1276. When did they first begin to come here?—I think it would be about 1824.

1277. Did you notice any diminution in the quantity of herring caught immediately afterwards?—No, I cannot say but that the fishing remained good for many years after that, but they did not catch any then. At that time they had 8*s.* bounty. Their own nets were not fit for fishing. They used to buy fish from the boats here, and pass them off in their own country and get the bounty.

1278. The French fish on Sunday, I believe?—All days are alike with them.

1279. Do your boats go out fishing on the Sunday?—No.

1280. Then they put up on Saturday night?—Yes.

1281. Can you tell us what a young man ought to earn at the present time by fishing?—Well, I think he ought to earn 100*l.* a year. He will want a third of that to keep his tackle, boats, and everything else up to what they should be.

1282. Does that include something for his boat?—I include the cost of keeping his boat, nets, and everything else in fishing order.

1283. Out of the remainder can he lay by anything for a new boat?—I do not know; that would depend upon various circumstances.

1284. Do you find that new boats are being built here?—There are none built at Newbiggin; we get them further up.

1285. But are any being bought and brought here for fishing? Is the number increasing?—A very great deal. As the men increase, of course they need more boats to go in, and a boat does not last a very long time. About 14 years is as long as any of our boats will last. We condemn them then; people may go out with them for pastime after they are 14 years old, but they are not considered seaworthy.

1286. Is the increase of fishermen here confined mainly to their own families, or do strangers come among you?—Strangers come and take part in the herring-fishing, but not in the other fishing. Some men will come for half as much as they get, and they buy no tackle or anything else.

1287. How do you sell your fish?—We ask so much money for them in the first instance, and then the price comes down until we effect a sale.

1288. It is like a Dutch auction?—Yes.

1289. To whom do you sell your fish; do men come round the coast and buy the fish as it comes ashore?—There are men in our own town who make a living by buying and selling fish.

1290. How do they send it away?—Principally by railroad now. It generally goes direct. It used to go to Hexham formerly.

1291. How long have you had the railroad here?—I think about eight or 10 years.

1292. Have you lost any lines yourself in consequence of the trawlers carrying them away?—No, I have not; they never came on this coast until last year, but there are some men here who have lost lines. There were only two or three of the trawlers seen here last summer, and there were none except during the herring season.

1293. Do you know of any cases where lines have been lost in consequence of the trawlers?—There are only two or three instances. I believe Robert Jefferson and John Jefferson have lost lines.

1294. How many cases altogether have you heard of?—Perhaps three or four; I believe that William Armstrong lost some.

1295. And those lines were lost within the last year or two?—They were all lost last year; when I come to recollect I think it was not last summer, but this present year.

The witness withdrew.

P. Jefferson.

PHILIP JEFFERSON called and examined.

1296. (*Mr. Caird.*) You are a fisherman here, I believe?—Yes.

1297. And you are cockswain of the lifeboat?—Yes.

1298. Have you been here all your life?—Yes.

1299. How many years have you been engaged as a fisherman?—For about 35 years.

1300. And do you follow all kinds of fishing on this shore?—No, not all.

1301. What do you practise?—I practise the herring-fishing.

1302. Do you practise line-fishing?—Yes, line-fishing, and I fish for salmon, salmon trout, crabs, lobsters. I have caught all these kinds of fish in my time.

1303. Is there any other kind of fishing practised here in addition to those I have mentioned?—We catch no other kind of fish. We have not got mackerel nets.

1304. Have you heard the evidence which has been given by William Dawson?—Yes.

1305. Do you generally agree with him in all that he has stated to us?—No, not in all.

1306. With regard to the increase in the number of boats and fishermen within your own recollection, can you state what that increase has been?—William Dawson has given you an account for 50 years, which is long before my time.

1307. But let us take your time, 35 years ago; can you tell us what the increase has been during that time?—No, I cannot give an account for the last 35 years.

1308. What was the state of the fishing 35 years ago; how many boats were employed in fishing then?—There were 17 or 18 engaged in the white-fishing.

1309. And how many are there employed now?—In the white-fishing do you mean?

1310. Yes.—There are about 26 employed in the white-fishing.

1311. And in the herring-fishing how many boats were there employed 35 years ago?—I think there would be about 20.

1312. And how many are there now?—I should say about as many again.

1313. About 40?—Yes, there are upwards of 40.

1314. Has the size of the boats increased during that time as well as the number?—Yes, they carry more nets now, and more fishing tackle.

1315. And more lines also?—Yes, and more lines too.

1316. Have you observed any perceptible difference in the quantity of fish brought in each boat to the shore after the fishing now, as compared with what it was 35 years ago?—Yes, it has differed very much.

1317. Is there less brought to the shore now or more?—It is less; the quantity has decreased very much.

1318. About what time did that evident decrease begin?—I should say about the year 1843 or 1844. Before then we used to bring as much as each boat could carry—as much as any cart could take away, and we used to have to put straw in to keep the fish in the cart.

1319. (*Mr. Lefevre.*) Is that line-fishing,—white-fishing,—of which you are speaking?—Yes, I have

brought them in and sold them for 1*l.*, and received the money.

1320. (*Mr. Caird.*) Has the decline in the quantity of fish been gradual?—Yes, year after year, until now.

1321. Then from the year 1843 or 1844 it has been gradually getting worse and worse?—Yes.

1322. Has there been no variation; has there been no good fishing at all since that time?—There has been none like what there used to be before.

1323. Then the decline has been a constantly progressive decline?—Yes, it has been going down and down every year.

1324. Have you observed any difference in the average size of the fish as well as in the quantity?—Yes, I think the fish are much smaller now.

1325. Much smaller now than they used to be?—Yes.

1326. Does that answer apply to all the fish, or to any kind in particular?—Yes, it refers to all the fish I have caught. I attribute the falling off in size to the destruction of the spawn. There is no other reason for it that I can imagine.

1327. Is it the fact that all kinds of fish caught here now are smaller upon the average than they were 35 years ago?—Yes, they are much smaller now than they used to be in those days.

1328. You refer to haddocks and cod?—Yes, haddocks, and cod, and skate, and turbot, and ling. They are all very much smaller now.

1329. So that within your recollection there has been a perceptible decrease in the size of the fish, and that decrease has been progressive?—Yes, from that time until just now. There has been a decrease year after year until now.

1330. I presume that you are speaking now of the take of each boat; but taking the increased number of boats that are employed now, as compared with the number that were employed at the time to which you refer, do you think there are as many fish brought to shore now as were brought to shore formerly?—No, I think they brought in far more in former times. We used to bring very heavy loads ashore; very heavy loads of clean haddocks. I have brought a cart-load ashore and sold it for 1*l.*, and now we can only get 5, 6, or 7 stone in a boat.

1331. With regard to the herring-fishing, have you practised that within the period you have mentioned?—I have been constantly engaged in the herring fishery. I have never been out of Newbiggin all my life.

1332. We have been told that the number of boats employed in the herring fishery has doubled during that time?—Yes it has.

1333. And that there has been a proportionate increase in the size of the boats and the nets?—Yes.

1334. During that period have you found that there has been a decline in the quantity of herrings caught?—Yes, very much so.

1335. Has it been a gradual decline?—In my day we durst not put all our nets out. Now we may put 17 or 20 nets in. We used to get 5,000 or 6,000 in a net at one time.

1336. And what do you get now?—Why we scarcely get 5,000 altogether.

1337. How many nets would you have put out at the time to which you refer?—About eight or 10 nets.

1338. And you would get 5,000 in each net?—Yes, we have brought 34,000 ashore in one night, with 10 nets; that is more than 5,000 a net.

1339. No, not quite so much?—Well, we have got that number in a net, and what can we get now. Why we can only get about 2,000, or 4,000, or 5,000 in a boat. Some may have more, but it is not many that have. The highest would be about 10,000, and from that it would range from 8,000, 5,000, 3,000, 2,000, 1,000, down to 800, 700, and 600.

1340. Have you any idea of the cause of that decrease in the quantity?—Yes, it is entirely owing to the spawn having been destroyed.

1341. What is it that you imagine destroys the spawn?—These trawl-smacks. We have every reason to say so.

1342. When did the trawl-smacks first come upon your shore?—Last summer.

1343. Last summer was the first time that they came here?—Yes, and there were only two of them then. I had my turbot nets in, and I was obliged to bring them ashore. A neighbour of mine lost two of his nets with the trawl-smacks.

1344. But if the decline in the quantity of fish has been going on for 35 years, how can you attribute it to the destruction of spawn, which only began last year?—If they destroy the spawn below this how can the fish come to us? If the eggs are destroyed how can we look for the young?

1345. You said that the trawl-boats never came opposite your shore until last summer?—Yes, that is quite true, but what is the reason that they have come now? It is because they have beggared the coast they have been on, and they have now come to beggar us, and to destroy the spawn. How will the fish be able to come to us if the spawn be destroyed?

1346. Have you yourself ever seen any trawling?—I have not actually been on board a trawling vessel, but I have seen it going on.

1347. You have seen it going on?—Yes, I have seen the trawlers fishing close by, and I have been obliged to tell them that they would take away our turbot nets. Indeed we had to bring them out, or else they would have done so.

1348. Do you agree with the former witness as to the difference in the quantity of fish brought upon your shore by a south-east gale as compared with a north-east gale?—Yes, I have seen plenty of haddock come in with a north-east storm and with a south-east storm also. I don't believe that the fish leave their spawn all on one spot. I have been told that in Hartlepool one of these smacks took the spawn not many miles from the land.

1349. Am I to understand that you have not noticed any difference between the effect of a north-east gale and a south-east gale in bringing fish to the shore?—I have noticed plenty of fish come both with a north-east gale and a south-east gale, but I do not notice that they come in now.

1350. Have you any complaint to make with regard to the French fishermen coming upon your ground here?—Yes, we have a very great complaint to make. We have had no protection at all here, and the consequence has been that the French fishermen have taken the fishing ground nearly away from us, year after year, altogether.

1351. Have there been any years in which you were well protected against the French fishermen?—Yes; when Captain Randolph was on board the "Cornwallis," and Mr. Vickers was in the gunboat, we had very good protection, but we have none now. Of late years we rarely have seen a gunboat. In former years they used to come and ask what the fishermen wished to have done, but now none of them come at all.

1352. How long is it since you had good protection?—It will be about two years ago.

1353. Then two years ago, when you had that protection, did you catch more herrings than you do now?—We got more when we were not entangled with the French, but still not so much as we got in former days. If it had not been for that protection we should have been obliged to leave the ground and let the French have it all to themselves.

1354. Then do you consider it a great injury to your fishing grounds that the Frenchmen should come here?—Certainly; we suffer a great deal from it.

1355. Did you ever complain to the men-of-war which have been stationed here?—I have complained to Captain Randolph, of the "Cornwallis."

1356. Since the protection of which you spoke has been taken away, have you complained?—Yes, I have.

1357. Did you complain this year?—Yes, I did, but what is the use?

NEWBIGGIN.

P. Jefferson.

23 Sept. 1863.

1358. Who did you complain to?—To Captain Ord, and he sent us to the "Cornwallis" to have our complaint heard.

1359. Was any notice taken of your complaint this year?—Not a bit.

1360. Has there been any interference with the French fishing boats this year?—I have seen none at all, but I don't know whether any other fishermen have. I have known a gunboat come into the bay and ask what the fishermen wanted to be at, but there have been none now for some years.

1361. Are there any regulations enforced on this coast, or do you agree with the previous witness that nobody regulates the times of your fishing or the size of your nets? Are there any officers authorized to do that?—I have not seen any lately; one used to come, but he has been done away with, and I have not seen him for a few years back.

1362. Do you think it would be of any advantage for the Government to interfere to regulate the size of your nets?—The greatest advantage we could derive from Government interference would be to send us protection against the French, and to do away with the trawl-smacks.

1363. Would it be of any advantage to fix rules as to the time for shooting your herring nets?—Yes, I think it would; they should not be shot until sunset.

1364. Would that be an advantage?—Yes, I think it would do good.

1365. Would all the fishermen think it an advantage?—Yes, I think so.

1366. Then would you be willing to accept a regulation of that kind as an improvement upon the present system?—Yes.

1367. (*Professor Huxley.*) You said that all the fish have become smaller of late years?—Yes, very much smaller.

1368. Much smaller?—Yes.

1369. Do you think that the herrings have become smaller?—I do not see so much difference in the herrings as in the other fish, but I think they all have gone a little smaller; still there are plenty of large ones.

1370. Have you used the same mesh for the last 30 years, namely, 36 meshes to the yard?—Yes.

1371. Then I suppose the herrings cannot have got much smaller?—No, perhaps not.

1372. Have you any notion as to where the haddock and cod spawn?—I believe they spawn on the banks off here—the Dogger Bank for instance.

1373. Do you think that they spawn on the Dogger Bank?—Yes, I think so, but I believe that they spawn at different places.

1374. Do they spawn between here and the Dogger Bank?—I have not been at the bottom to see, but I should think they do.

1375. Don't you think that they probably spawn all about here?—I should think they might, but mostly about the banks.

1376. Do you think, for example, that if the coast south of here were to be well trawled the destruction of the spawn that would ensue would interfere with your fishing here?—Yes, I certainly think it would.

1377. Do you consider that the fish which come off this bay are bred down further south?—I think they come from different parts, both north, east, south, and south-east. I don't mean to say that they come from the west, but I think they come from different parts all along here.

1378. Then you think they are bred out at sea and that they come in here?—Yes, I think so, perhaps they do not come so much north; they come north-east,—free of the land north-east.

1379. Notwithstanding that they are bred in all parts where there is a sea bottom, do you think that the trawling further to the south interferes seriously with the production of fish?—Certainly, it interferes very much with it. The trawl nets will bring up the spawn, and if they destroy the eggs there can be no young; it is a sure thing that. You are well aware that if they destroy the eggs there will be no young, and they will do that before they come from you end.

1380. You have been a line-fisherman, I believe, to a great extent?—I have fished in that line of life all my life. I have never been out of the place.

1381. Have you noticed a large portion of the fish spoilt and destroyed by the dog-fish and such like?—Yes, a great deal.

1382. What is the average loss you sustain?—Sometimes we have 1*l.* worth on the line destroyed, sometimes 25*s.* worth.

1383. What proportion of the whole fish you catch is carried away by the dog-fish?—Not a great deal nowadays.

1384. The last witness told us that sometimes the lines were altogether cleared?—Aye, that would be in his day, but there is not so much now.

1385. There are not so many dog-fish as there used to be?—No.

1386. Are there as many suckers?—Yes, I think there are.

1387. Do they destroy many fish?—Yes, a great many.

1388. You heard what the last witness said about the spawn of the flat-fish?—I don't know much about that.

1389. (*Mr. Lefevre.*) You say that during the 35 years you recollect the fishing here the boats have increased double in number?—Yes.

1390. Do you think that each boat now catches less than half what used to be caught by one boat?—I should say that each boat catches less than the half.

1391. Then the whole quantity caught must be smaller?—Yes, I think it is much smaller.

1392. But with regard to each boat, what is the proportion now caught?—Less than one half I should say.

1393. How much less; do you think it would be one third?—I should say less than a half.

1394. Do you think it would be one-third?—I will say no more than that.

1395. Then it would be somewhat more than one third?—It is less than a half.

1396. I believe that the price of fish has increased very much here?—What is the use of that?

1397. Is it not true that the price of fish has increased very much?—I don't know. There are no fish caught now.

1398. Do you make the same earnings now that you used to do in one way or another?—No, I do not.

1399. Then tell us what the difference is?—I should say I make about one half.

1400. In round money?—Yes.

1401. What can you make a week now throughout the year?—Sometimes 1*l.*; sometimes I get nothing.

1402. But take the year through, what do you get?—I am telling you,—the half of what I used to get.

1403. In round money?—Yes.

1404. Then formerly it was a very good business indeed?—You must remember there was a lot of expense attending it of which you have no idea. There was a lot of these things (*pointing to a buoy*) and other things to provide.

1405. But the expense is the same now as it used to be, is it not?—There is more line to keep up now. In consequence of the increase of the nets there are double the quantity used now as compared with what were used in former days.

1406. What I want is to get at some comparison between the earnings now and what they used to be?—I come as near to it as I can when I say about one half.

1407. I don't want to be inquisitive, but I should like to know what your earnings are now, taking the year round?—I have not kept any account of that, but I should say about one half.

1408. What were you in the habit of making when you were young—say 35 years ago?—Why, in the herring fishery I used to make 100*l.* in those days, and that is as much as I can make in a year now.

1409. You made 100*l.* in those years by the herring fishery?—Yes, if the fishing was good.

1410. But that was a very good year when you made 100*l.*, was it not?—Now I make scarce 20*l.* a year.

1411. This year have you made 20*l.*—Yes, and formerly I have made 100*l.*

1412. But was not the year in which you made 100*l.* a very good one?—I generally made 80*l.* or 90*l.* in those days, but now there are no fish.

1413. Do you attribute the diminution of the fish to the trawlers?—Yes, certainly. I lay the blame entirely upon the French and the trawlers.

1414. But the Frenchmen only catch the herrings?—Yes, but the herrings are the fisherman's harvest.

1415. Thirty-five years ago the Frenchmen were not here at all?—They did not fish so much in those days, and yet there were double the quantity of fish. As I told you before, they durst not put the nets out in those days that they use now.

1416. Taking into consideration what the Frenchmen catch now, and adding that to what you catch, do you think that the whole quantity of herrings caught now is less than it used to be?—Yes, taking the French and altogether. The herring does not come on the ground as it used to do.

1417. With respect to the decrease in the number of fish taken by the long-line fishing, do you attribute the diminution to the trawlers?—Yes.

1418. How long do you recollect the trawlers fishing off this coast?—I was obliged to fetch the nets away for them only last year.

1419. Have you seen them farther north upon this coast?—No; they have not been much about this coast. They have been more south.

1420. More towards the Humber?—Yes. I think the first place they were seen at near us was Sunderland.

1421. How long is it since they were seen off Sunderland?—It would be about five months ago since I first heard the complaints made; but they were constantly going backwards and forwards to Hartlepool long before that.

1422. Have you observed that the diminution in the fish has been gradual for some years past?—Yes, it has been going on year by year.

1423. (*Mr. Caird.*) Take an average-sized boat for the line-fishing here, what would be the cost of such a boat with its tackle and fishing lines complete? What capital is there in it?—Do you mean for the white fishery?

1424. Yes. That is one of the largest boats, is it not?—No; our herring boats are the largest boats.

1425. But I will take a line-fishing boat first. For an average-sized boat what would be the cost of the boat, of its tackle, and of its fishing lines?—I got a boat last year and I paid into the builder's hands 19*l.* 10*s.*

1426. And how much would it cost to make her fit for the sea; I presume that that sum did not include masts and sails and fishing tackle?—No, only the boat's shell. The sails would be 5*l.* each.

1427. Would it cost about 43*l.* or 44*l.* to make her ready for sea?—Yes.

1428. What do you suppose is the annual wear and tear of that boat and tackle?—If they are not well taken care of and protected they will all go down in the first season. Everything will be done if they are not looked after as they should be. The very first season will do for them in the white-fishing.

1429. That is with regard to the white-fishing boats. Now with regard to a herring boat, what will that cost?—A herring boat will cost 100*l.*

1430. All ready for fishing?—Yes.

1431. Have every three fishermen who go to sea in the line and herring fishery both a line boat and a herring boat?—Some will have a line boat, and some will have one boat between two. They have different ways.

1432. The two boats together, the herring boat and the line boat, will cost very nearly 150*l.*?—Yes.

1433. Can you tell me what will be the annual depreciation upon that capital of 150*l.*, in order to keep the boats good, taking into account the occasional loss of a boat, the wearing out, and the repairs that are necessary?—Do you mean the cost of taking care of them as well?

1434. I want to know how much it would cost in a year to keep all that good?—I should say it would not cost less than from 25*l.* to 30*l.* to keep it up.

1435. (*Mr. Lefevre.*) Have you both a herring boat and a line boat yourself?—Yes, I have a line boat and a herring boat, and every kind of boat, and they are all paid for.

1436. (*Professor Huxley.*) There is one thing about the mode of fishing you spoke of on which I wish to ask you a question. You spoke of a turbot net. What kind of net is that? Down south we catch turbot with hooks?—You know what a salmon net is?

1437. Yes.—The turbot nets are somewhat similar. The meshes are large. The turbot is a round fish. The nets are set on the bottom, and you work them the same as a salmon net. They have cork floats.

1438. Is there a pocket at the end of the net?—No, there are no pockets.

1439. Then I suppose the fish entangle themselves in the meshes?—Yes.

1440. Do you bait the nets at all?—No.

1441. They simply walk in?—Yes.

1442. Do you know the places the turbot haunt?—Yes, we find them upon a smooth bottom close to the edge of the rock.

1443. And you simply sink your nets down?—Yes.

1444. And you leave it just a matter of chance for the turbot to go in?—Yes. We take in the nets every other day.

1445. (*Mr. Lefevre.*) How many men are there engaged in the fishery here?—I can hardly tell you at present. Do you mean young and old?

1446. Yes, in round numbers.—Do you mean how many men there are engaged in the white fishery?

1447. Yes, and in the herring fishery as well?—I hardly know. Perhaps there are 150. There may be one or two more or less, but it is about that.

1448. (*Mr. Caird.*) Do you use the same net for catching salmon trout that you do for catching turbot?—It is made of the same kind of twine.

1449. But it is not the same net?—No, it is not the same mesh. The salmon trout would never stop at a turbot net.

1450. Do you get much salmon trout here?—No.

1451. Do you get much salmon?—Just a chance one now and then.

1452. Do you set a net for salmon?—We catch all that come.

1453. But do you set a net for the purpose of catching salmon?—No.

1454. Do you set the salmon trout net, or just put it out of the boat?—We set no stake nets. We have one net on the top of the water and another net below. The salmon net floats on the top. The one is close to the bottom in deep water, and the other is on the top.

1455. (*Professor Huxley.*) How long is your turbot net?—About 50 yards long, and we set perhaps 18 or 20 nets together.

1456. Don't they foul when the tide shifts?—Very often they do.

1457. (*Mr. Lefevre.*) Does it not answer to fish for mackerel here?—Sometimes. I think if we had proper nets we could catch them. We have some shoals off here sometimes, but this year there have been very few.

1458. None of you have mackerel nets?—None.

1459. (*Professor Huxley.*) How wide is the mouth of the turbot net?—We simply drag the net along.

1460. (*Mr. Caird.*) When you stated that the herring season was the fisherman's harvest, did you mean that you get more money from the herring than from all the other fish put together?—Yes; in the winter time we don't often get to sea.

NEWBIGGIN.

P. Jefferson.

23 Sept 1863.

1461. Then the herring-fishing generally yields you a larger sum than the rest of the fishing?—Yes, and therefore we think we ought to have very good protection during the herring season.

1462. (*Mr. Lefevre.*) The herring-fishing lasts for six weeks or two months, does it not?—As long as we see any in fine weather we follow them.

1463. How long should you say that the herring-fishing lasts?—About two months, and sometimes as high as three months.

1464. Then do you earn more during those two or three months than in all the rest of the year put together?—We ought to do so, but lately it has gone down greatly. We have lost a great deal in the fishing for want of protection. When Mr. Vickers was in the gunboat here he was a very good man for us, but they took him out and placed him in the Channel fleet, and now we have no one to protect us.

1465. Then you attribute the loss you sustain in the herring season to the French fishing boats?—Yes.

The witness withdrew.

H. Jefferson.

HUNTER JEFFERSON called and examined.

1466. (*Mr. Caird.*) Have you been long a fisherman here?—I have been a fisherman all my life.

1467. And have you practised all the kinds of fishing which are practised on this coast?—Generally speaking I have caught nearly all the kinds of fish that are caught here.

1468. Have you noticed any falling off in the quantity of fish caught here within your experience?—Yes, I have.

1469. Do you agree with the previous witnesses who have been examined in the statements they have made?—Yes, I quite agree with them.

1470. You are of opinion that they have given a correct statement of the case?—Yes, I quite agree.

1471. Have you yourself ever been engaged in trawling?—I was engaged in it when I was a little boy, but I have not followed it for many years now.

1472. Was that deep-sea trawling?—No, it was trawling in-shore.

1473. You mean trawling for soles?—Yes.

1474. Does anything of that kind go on here now?—No, little or nothing. There has just been one boat out, I believe.

1475. When you were engaged in trawling for soles, did you ever find any spawn in your trawl net?—I cannot say that I ever noticed anything of the kind, but I do not think the spawn will be so close in-shore.

1476. Have you ever drawn up any spawn in your trawl net?—I cannot say. I hardly knew what spawn was when I went out trawling. I was a very little boy indeed.

1477. I understood you to say that you have never been deep-sea trawling?—No, I have not.

1478. Have you lost any of your lines in consequence of the deep-sea trawls passing over them?—Upon one occasion I lost two nets and part of another one, and one of these buoys (*pointing to a buoy in the room*).

1479. When was that?—Last July.

1480. (*Mr. Lefevre.*) Were they herring nets?—No, turbot nets. They were taken clean out of the ground.

1481. (*Mr. Caird.*) Did you not see the boat that did it?—Yes; we saw him and spoke to him, but he had no number. He had it painted or tarred out, and he would not tell us what it was.

1482. Do you think it a good regulation that a conspicuous number should be painted upon every trawl-boat?—Yes, that would be very well; but it would be far better if the trawl-boats could be done away with altogether.

1483. Is there a number upon all the trawl-boats?—Yes; all fishing boats ought to be numbered.

1484. You think you ought to have had some means by which you could have proceeded against the man who destroyed your lines?—Yes, and we should have had, if he had had his number there; but he had no number, it was painted out.

1485. Was your loss considerable? What was the value of what was destroyed?—I do not know exactly, but I can give a rough estimate. I should suppose the loss would be between 4*l.* and 5*l.* But we lost in addition the quantity of fish which might have been in the nets. We had caught several fish that day, and I have no doubt there were fish in the nets.

1486. You say that this occurred last summer?—Yes, it was in the month of July.

1487. Have you observed, after a trawl-boat has passed over your ground, that there is any difference in your lines?—I have not noticed that very particularly.

1488. Do you get as many fish after the trawl-boat has passed as you did before?—I have not noticed any difference in that respect.

1489. With regard to the herring fishery, have you noticed the same decline in that as in the white-fishing?—I should say that there has been a gradual decline in the herring-fishing as well as in the white-fishing. But there are more boats engaged in catching the herring than there used to be.

1490. You mean that there has been an increase in the number of boats here and of the French fishing boats which come in among you?—Yes.

1491. Have you any reason to complain of the want of protection you receive against the French fishing boats? Do they interfere much with your fishing ground?—It appears from what the coxswain has stated that he made a complaint, and that he got no satisfaction.

1492. Do the French boats interfere much with your fishery?—Yes, they have done us a good deal of harm this year.

1493. Upon your fishing ground?—Yes.

1494. What proportion of the herring caught is caught by the Frenchmen on your ground?—I have no idea, but they catch a good deal.

1495. Will it be one half or one third?—I should say it must be nearly a half, for their boats are very large.

1496. Do they remain during the whole time the herring is here?—They are here all the season passing along where they think the herrings are.

1497. Do you think it of advantage that any regulation should be adopted to provide that no herring nets should be shot until after sunset?—Yes, I think that would be an advantage.

1498. Do you think that shooting the nets before sunset operates injuriously against yourselves?—Yes.

1499. And you think that a regulation to prevent it would be of advantage?—Yes, I think it would.

1500. Do you think that such a restriction would do injury to the supply of herrings?—No; I think it would do good in some respects.

1501. In what way?—When the nets are shot before dark,—and they are sometimes shot a long time before dark,—if the herrings are there they fly to one side, either the inside or the offside; whereas if they are put down when the sun is going down, and it is beginning to darken, the fish would lie among them.

1502. Have you had any proof of the advantage arising from shooting the nets after dark?—We have noticed that when they have been put in before sunset the fish have slipped away from the ground where we have got them the night before. They see the nets before it is dark, and they fly from them as a necessary consequence.

1503. Have you seen many mackerel off this shore?

—I have seen large shoals sometimes, but not many this year.

1504. Have you seen many in former years?—Yes, I have seen quantities in former years.

1505. Are there mackerel caught as a rule off this coast?—At Blyth there may be. I believe that some men there have been catching them with the line this summer.

1506. Do they make a good business of it?—Sometimes they make a good day's work.

1507. (*Professor Huxley.*) Do you recollect the price of fish here when you brought them ashore 20 years ago?—Fish would be considerably cheaper then.

1508. Do you recollect as far back as that?—Yes, I think I can.

1509. What was the price of haddocks 20 years ago?—I can hardly say; one does not notice these things minutely.

1510. Can you give a guess. You say they were cheaper. How much cheaper were they?—I should say that the price will have varied one half. I should think that they were one half cheaper than they are now.

1511. Was that the case with herrings?—The price of herrings varies very much.

1512. I speak of a general average. What is your impression as to the difference. Do you think on the whole that herrings were much cheaper?—Yes, I think they were.

1513. To the same extent as the white fish?—I do not know exactly. I think they would be to the same extent.

1514. Do you think that any kind of police regulation would be of advantage in preventing the destruction of your lines by trawls? Is there any kind of regulation you can think of that would be of use to you to have enforced?—Why, sir, if there was anything of that kind it ought to be on the sea, or they could not stop the trawlers. For my part, I don't know how any police could stop them trawlers.

1515. Is it not possible that something might be done by a man-of-war's boats or gunboats; have you any remedy that you could suggest short of putting down the trawlers altogether?—The only remedy we are seeking now is to try to get them put down, if possible. If they are not put down, in the course of a few years the fishing here will be of no use, and the fishermen may lay by their lines and nets as soon as they like.

1516. Do you think that the trawlers can work without damaging your lines?—No, I think not.

1517. Not by taking care and keeping out of the way of the buoys?—I don't think they could. Where we have as many as 20 boats fishing a certain distance from each other they cannot trawl between them without getting fast with some of them.

1518. You do not think it possible for line-fishing and trawl-fishing to go on together? You are of opinion that one of them must go to the wall?—Yes, and we must go to the wall, because their nets will take ours.

1519. Did you ever hear of an expression common in Scotland, namely, 'breaking the eye' of a shoal of herrings?—I cannot say that I ever did.

1520. What it means is breaking up a shoal. You spoke just now of putting down the nets by daylight; the Scotch fishermen say that if you do that the shoal disperses. Do you think that is the case?—Yes, I do.

1521. Have you yourself seen anything of that kind occur?—Yes; I have set them down at a certain spot, perhaps at night, and I have gone the next night and shot them in the same place, but I have found myself compelled to go further in. I have shot them before sunset and I have found that the herrings have shifted away.

1522. Do they shift as a shoal, or do they break up?—The whole body shifts just on one side.

1523. (*Mr. Lefevre.*) Have you observed the French fishermen fishing on the Sunday off here?—They fish all times,—Saturdays, Sundays, and all times.

1524. Have you observed them?—They mind no more about Saturday night or Sunday night than any week-day night.

1525. You have seen them fishing on Sunday?—Yes, just the same as on any other day.

1526. And do they come within the three-mile limit?—They generally get the greatest catch on a Saturday night; there are no boats of ours there then.

1527. And on Sunday does the same thing take place?—Yes; all nights are the same to them.

1528. Do any other fishing boats come for herrings from the south besides the French boats?—Yes, sometimes large Yarmouth luggers and the Lowestoft boats will come, but they are not so many in number. There are only six or seven. The French boats, however, come in swarms, and they do a vast deal of harm.

1529. Do I understand you to say that you have only observed the beam-trawlers here during the last six months?—They have only got down here during the last six or eight months, but they have been trawling lower down for a long time; they have been down at Hartlepool and Sunderland.

1530. And they have only been six or eight months here?—No.

1531. In what number have they been off here?—I believe that one night last week there were 16. There were nine off here last night.

1532. Were they trawling on the ground you fish upon?—Yes.

1533. How near the shore?—The nearest they would come would perhaps be three miles, or off and on that way. They trawl away in the sea.

1534. What is the greatest distance at which you set your lines?—We set them sometimes further out and sometimes nearer in.

1535. But what is the furthest distance?—Last summer some of our boats went as far as 20 and 30 and 40 miles.

1536. That is rather a considerable distance, is it not?—Yes.

1537. Is that the general distance, or is it only exceptional?—We generally fish from six to seven or eight miles off the shore.

1538. Can you suggest any regulation for preventing the trawlers from coming a certain distance within the coast?—I do not think I can.

1539. You cannot suggest any regulation of that kind?—I think the best thing we could get, if we could accomplish it, would be to have them put off altogether, because wherever they go they destroy the fish.

1540. You do not mean off this coast alone, but everywhere I suppose?—If they would only keep to their own homes they would not do us as much harm as they do.

1541. How near the coast was your boat when you lost your nets?—As near as I can guess I should be about seven or eight miles from the shore.

1542. Do you know many instances of the same kind where nets or lines have been lost?—During last summer there were four or five cases.

1543. Four or five?—Yes.

1544. (*Mr. Caird.*) Are the Yarmouth and Lowestoft boats large boats like the French boats?—Yes, they are about the same size.

1545. And have they nets of the same description?—Yes.

1546. They are altogether fitted in the same manner as the French boats?—Somewhat similar. There is little difference, I think.

1547. And do they come among your nets the same as the French boats?—Yes, they do.

1548. But you do not object to them, do you?—Yes, we do, because their nets are far stronger than ours, and they have kegs to float them, and if they get among our nets they are sure to do us harm.

1549. Do they do you as much harm as the French boats?—Yes.

1550. Speaking of your experience of 25 years ago, what weight of fish would a boat bring ashore from

NEWBIGGIN.

H. Jefferson.

23 Sept. 1863.

line-fishing then?—They would sometimes bring a ton of fish in a boat.

1551. Would that be a common day's fishing?—Yes.

1552. What would be an average day's fishing now?—It would be considerably short of that. There is nothing like one third of that now.

1553. Will a boat bring on shore now on the average about one third of a ton?—Nothing like that.

1554. Then what weight of fish should you say will be brought ashore now?—Sometimes 3, and 5, and 6, and 10, and 15, and 20 stone a day, on the same lines we used to be fishing when we got a ton.

1555. (*Professor Huxley.*) In speaking of a stone, do you mean a stone of 14 pounds?—Yes.

The witness withdrew.

J. Dawson.

JOHN DAWSON called and examined.

1556. (*Mr. Caird.*) How long have you been a fisherman here?—Since the year 1830.

1559. Have you been employed in all the different kinds of fishing practised here?—Yes, in all the different kinds.

1560. Do you agree generally in the evidence which has been given by the other witnesses as to the gradual falling off in the quantity of fish caught here?—Rather more so. I differ with them a little on that point.

1561. I am now speaking of the time when you say you commenced fishing. In 1830 what was the average take here?—I was only a boy then. I would rather confine myself to the years 1840 and 1841.

1562. That would be 20 years back. What would your boat bring home then as an average day's fishing?—I can recollect one day, on the 16th of February 1841, there was a boat belonging here, the Rose of the Valley, owned by Thos. Jefferson, which fetched in more than 30 cwt. of good haddock, and the whole of the boats, about 20 in number, on that day averaged about one ton each.

1563. What would the 30 cwt. taken in Jefferson's boat sell for?—Somewhere about 2*l.* 5*s.* I should say for the lot. I cannot exactly say.

1564. That was an extra day, and was beyond the average?—The boats on an average caught a ton each, and there would be about 18 or 20 boats there.

1565. That was an extra take?—Yes, but there had been capital fishing that year in the months of January and February, and even in the fore part of the spring.

1566. In 1845 (can you take your memory back to that year) what was the state of things?—It was not so good in haddock, but it was very good in ling and cod. In the month of April 1845 the boat of which I was skipper was off this coast, and we caught fourscore cod fish, nine prime ling, one large halibut, one dozen skate, and 15 stone of haddock, all of which were sold for the sum of 1*l.* 2*s.*

1567. Have you any other data with which you can supply us that will give us the average of another year?—I can give you the corresponding period 20 years afterwards.

1568. You mean the year 1861?—Yes.

1569. Well, what was the take then?—I rather agree with one of the witnesses who stated that the average take at that period would not be more than from three to 20 stone, but I think he spoke rather beyond bounds, if anything, for I do not think myself that the boats would all catch that amount.

1570. That was in 1861?—Yes, in the month of February.

1571. (*Professor Huxley.*) And you say that they would not take more than 20 stone then?—No; more than half of them would take far less than that.

1572. What do you consider would be the average fishing in the year 1861?—I should think that the whole of the boats would not realize more than a ton and a half, which was only about as much as one boat got 20 years previously.

1573. Are you sure that you are quite accurate upon that point?—Yes.

1574. You do not make the statement at random?—No, I do not. I have witnesses here who can prove the truth of what I say. Mr. John Brown can prove the truth of my statement, but I have put it down in writing, and here it is (*handing in a paper*).

1575. Is that in your handwriting?—Yes.

1576. (*Mr. Caird.*) Will you read it?—Yes (*the witness read the statement, which simply narrated the facts stated by him in his evidence*).

1577. Now you say that the average catch would be from 3 to 20 stone?—Yes.

1578. That is a very wide average, cannot you make it narrower than that?—I do not think that I can conscientiously.

1579. What may be the value of 10 stone of fish now?—At a very bad time when there has been a scarcity I have known them fetch 3*s.* a stone, but when there have been heavier catches they have fetched much less.

1580. Will the value of a boat's fishing be equal to what it was when in 1845 you sold a catch for 1*l.* 2*s.*?—About the same I should think.

1581. The average will be about the same?—Yes, about the same.

1582. Although the quantity of fish has fallen off the return of the fishermen in money is now equal to what it used to be?—In some cases it is, and in other cases it is not. If the market is bad in the south we have to sell the fish cheaper. Some days the fish are rather high, which makes up for the loss, or else the fishermen and their families would not be able to live at all.

1583. Have you any remarks to make to us as to the alleged increase of trawl-fishing?—Yes, I have.

1584. What is it you wish to say?—If this fishing is prosecuted here for five or 10 years longer such a thing as a haddock will not be known to be caught on this ground.

1585. What ground have you for saying that?—Because they disturb the spawn when it is laid upon the bottom of the deep and prevent it from coming to maturity; when once disturbed it will never congeal again, consequently it is altogether destroyed.

1586. Are you sure that the trawl disturbs the spawn?—Yes.

1587. Have you ever seen it do so?—Not myself, but a person told me that he had seen as much as a ton and a half offered for sale by the trawlers.

1588. (*Mr. Lefevre.*) Who was that?—A man named Templeman.

1589. (*Mr. Caird.*) Do you complain of the interference of the French boats in the herring fishery here?—Yes, I do.

1590. Do you think that it is injurious?—Yes, it is very injurious in every sense of the word.

1590*a*. Both because they take away the fish, and because they employ heavier boats and nets?—Yes, I will give you a case to illustrate the thing a little: About the 2nd or 3rd of the present month, as near as I can guess, such a fleet of herring boats took possession of the fishing ground that the fishermen belonging to this shore were not able to get their nets down at all; we were therefore obliged to take our boats back again to the land or else to fish inside them.

1591. Were those boats French boats?—Yes and there were about 100 in number.

1592. And they completely put you off your own fishing ground?—Yes; they did at the beginning of the night. If the weather is at all rough we are obliged to fly away from them, or else we should lose the whole of our nets. We should be sure under such circumstances to get foul of them.

1593. What distance might it be from the shore that the French fishermen were fishing?—We were in only 30 fathoms of water, rather outside the light.

1594. What distance from the shore would that be? About eight miles.

1595. Then that would be beyond the protected limit?—Yes.

1597. Then they were fishing upon ground upon which they had a right to fish?—Yes, but we wish to have a sort of fair cast for ourselves. We want a line of demarcation made between the French and English boats. Our boats are much smaller than theirs, and they are even smaller than the Scotch boats, or those that are employed down in the neighbourhood of the Fern islands. If our boats come across any of their boats we have nothing but death before our eyes, or considerable injury; we are therefore obliged to get out of their way as fast as possible. Upon the night of which we have been speaking I came half a mile inside of them, and the consequence was that I caught no fish. I took the nets up towards midnight, and I tried to find a vacancy between the French boats. Sometimes they separate by driving in the night, but when I made the attempt I found that it was useless, and I was obliged to steer to the north. In shifting across to the north I met with a gunboat. There was a little bit of shady moon that night, and I did not see it before. I determined to have a word with him. I said, "It is a fine evening, sir." He said it was a very fine evening; and then he said to me, "Have you seen any Frenchmen?" I said, "Yes; there are a hundred of them; they are only a mile south of you." He said, Have you caught any fish?" I said, "No, I have caught none." He said, "How is that?" I said, "I have not been able to get on the fishing ground in consequence of the French fishing boats having possession of the ground. I have been obliged to set my nets half a mile inside, and the consequence has been that I have caught no fish." I said, "We have had very bad protection this year, in fact we have had none, and the result and the consequence are that the French fishermen take possession of our ground, and we and our families may starve." With that he gave a laugh and we separated.

1598. How long is that ago?—It would be about the 3rd or 4th of September.

1599. Do you mean in the present month?—Yes.

1600. And that was a night when the French fishermen were fishing eight or nine miles from the land?—Yes, it was a bit later on in the year. They were within their limits.

1601. (*Professor Huxley.*) Are not the south-country boats from Lowestoft and Yarmouth as heavy as the French boats?—Yes.

1602. If they come and fish here do they not interfere with you quite as much as the French boats do?—No, I think not: their nets are not of a kind that would interfere with us as much as the French nets, and they only remain here a few nights and go straight home. They do not catch many fish. The reason I assign for that is that their nets are too thick in the mesh, and the herrings cannot get their heads far enough into the mesh to enable them to stop in.

1603. If the south-country boats were to use nets of a proper size to enable them to catch fish, and come and fish over your ground, would you not feel that a hardship?—Yes, we should; but we have an Act of Parliament which says that decked boats are not to shoot within a less distance than a mile of an undecked boat. They drive further to the sea with the wind, but if they are to the windward they must be that distance or they will come right upon us.

1604. If that regulation were enforced have you any objection to it?—Not at all to boats of our own country.

1605. Would you be satisfied if such a regulation were enforced with regard to the French fishing boats?—It ought to be enforced, but I believe we have an Act of Parliament with regard to it.

1606. Would you be satisfied with that?—I would for my own part.

1607. When, in your observation, did the fishing or the catches of fish begin to fall off?—I agree with the former witnesses; I believe that there has been a gradual diminution within the last 20 years.

1608. There has been a diminution year after year?—Yes.

1609. You have not noticed it greater in any particular year than in another, have you?—No.

1610. It has been steadily decreasing?—Yes.

1611. And does that apply to the herring as well as to the other fishing?—The herring fishing has been on the decrease, but not so far back—perhaps about ten years.

1612. Do you think that the herrings began to decrease about 10 years back?—Yes, about the year 1855. In the year 1851 there was a capital take of fish got on this coast, and in 1852 there was as much as that. The price was reduced in Cullercoats to 3*s.* 6*d.* per thousand. At that time the French fishermen generally bought them. I was fishing, and I saw a French vessel coming direct to me. I thought he wanted the herrings I had caught, and I allowed my boat to be intercepted by him. He gave me 9*s.* per 1,000 for the lot. On another day in the same week there were four of us employing a steamboat, and what we got after paying for the steamer was about 7*s.* 6*d.* per 1,000.

1613. In what year was that?—It would either be in 1852 or 1853.

1614. Has the fishing greatly fallen off since then?—Yes.

1615. Do you think that that falling off has been entirely caused by trawling?—I think it is greatly attributable to the trawling, because a great many fish used to be driven in by the south-east storms. I differ from one of the witnesses who said that more fish came by the south-east storms than by the north-east storms; for I think the south-east storms make them rather less than they used to be.

1616. What do you ascribe that to?—I attribute it to the ground being impoverished by the trawling smacks.

1617. Because the trawls in your opinion have swept the fish off the ground?—Yes.

1618. Have you ever fished with your lines over ground that the trawls have passed over?—No, I have not.

1619. Is there any noticeable diminution in the catch of fish?—We do not expect now to catch one third of what we used to catch.

1620. Is that your experience?—Yes. I think the trawlers will take two thirds of the fish away.

1621. Is that the experience of fishermen generally?—It is my idea, and I should be prepared to expect that.

1622. (*Mr. Lefevre.*) Twenty years ago were the French fishing boats off this coast as numerous as they are now?—No, not nearly so numerous. I have heard of 400 sail being cleared from Boulogne during the last year.

1623. What has been the increase during the last 20 years?—About two thirds, I should say.

1624. The number of boats is now two thirds more?—Yes.

1625. And the French fish two days a week more than you do?—They do.

1626. Then, looking at the quantity of herring caught by the Frenchmen, and the quantity you catch, do you think that the whole catch has diminished or not in this part?—I think that the whole catch is diminishing.

1627. You think it has diminished after taking into consideration what the Frenchmen catch?—Yes.

1628. How much do you think it has diminished?—I should say that it has decreased a third.

1629. Even taking into consideration what the French catch?—Yes.

1630. Then, with regard to the diminution in the white-fishing, do you mainly attribute that to the trawlers?—Yes.

1631. Do you find a greater difficulty in making a livelihood now than you did 20 years ago?—Yes;

NEWBIGGIN.

J. Dawson.

23 Sept. 1863.

in fact a livelihood could not be made if the fish were sold as cheap now as they were then.

1632. Looking to the price of the fish now, and what it was then, do you make as much now a year as you did then?—To tell you the real truth, I am astonished to see the fishermen sustain themselves as well as they do during the winter months.

1633. Have you noticed any decrease in your net earnings?—The earnings have been greatly reduced, but I think that the people are more economical now than they were formerly.

1634. Do you think that your net earnings are considerably less?—Yes.

1635. How much less, can you tell me that?—I should say one fourth at least.

1636. How much did you make 20 years ago; how much per man, per week, taking the year round?—I cannot agree with the first witness. I never made as much in a year as he has done.

1637. Twenty years ago how much did you make?—20 years ago, as nearly as I can calculate, my earnings would amount to perhaps 60*l.* a year altogether.

1638. Is that including the herring season?—Yes, the herring season included.

1639. Your earnings are now one third less?—Yes.

1640. (*Mr. Caird.*) You mentioned that in 1853 you sold fish to the French boats?—Yes.

1641. Did the French boats at that time come and interfere with your fishing?—Not so much then as they do now, and the reason of that was this: Every year the French fleet comes on this coast now the Emperor accompanies them with a man-of-war, a steamship. I recollect the name of one, "L'Ecosse"; she came for several years, and she was brought up on the ground at the time the fishing boats are generally taking up their nets, lest any of the French fishing boats should begin to buy of the English fishing boats. The presence of this man-of-war deprives them of the chance, because if they did that the man-of-war would seize them immediately, according to the French law.

1642. Was there no man-of-war sent along with the fishing boats previous to the year 1853?—I do not recollect that any was sent before.

1643. Then the custom was, when there was no means of preventing the traffic, for the boats to buy rather than to fish for themselves?—Yes, I have sold many a cargo myself.

1644. But since the man-of-war has been sent over the boats have come and fished in greatly increased numbers?—Yes.

1645. What do you attribute the falling off in the herring fishery to? What reason do you assign in your own mind?—I attribute it to the same reason that I assign for the diminution of the haddock-fishing.

1646. What is that?—Because I think that when the spawn of the herring is deposited in the ocean, if it is once disturbed it will never come to life.

1647. Then you attribute the falling off to the trawling?—Yes, partly.

1648. To what else do you attribute it?—To the great number of catchers.

1649. You mean that there are a great many more boats employed in catching the fish now compared with what were employed formerly?—Yes.

1650. (*Mr. Lefevre.*) How far apart do the French boats fish?—At various distances, but they shoot their nets sometimes in the middle of the day, and that, I think, has a tendency to frighten the fish clean off the ground altogether.

1651. I want to know how far apart they shoot their nets?—When they are thick they are not further apart than 200 yards. I have seen them all with their nets alongside of each other in the morning as if they were in a tier in one of our English ports; such was the case on the 7th of September in this present month.

The witness withdrew.

J. Brown.

JOHN BROWN called and examined.

1652. (*Mr. Caird.*) Have you been a fisherman here all your life?—Yes.

1653. Have you had many years' experience of the fishing on this coast?—Yes, I have been fishing for 27 years.

1654. Do you agree with what has been said by the other witnesses with regard to the gradual diminution of the quantity of white fish and herring caught off this coast?—Yes, I do.

1655. Have you anything more to add to what they have already said on the subject?—I have nothing more to say than what they have said.

1656. Have you observed whether there is any falling off in the size of the fish as well as in the quantity?—I daresay there is, but I can say positively that there has not been near the quantity caught that used to be.

1657. Has there been a difference in the size and weight of the fish?—I do not think that there has been so much difference in the weight as in the quantity.

1658. Do you think it would be of advantage that any regulations should be adopted for preventing herring nets being shot before sunset?—Yes, I think it would be a good thing, but of course the Frenchmen would take possession of the ground. It would be a good thing if that could be stopped. Wherever we go they come and take possession of the ground. We have six or seven miles to go, and as soon as they see the English boats put off they start and shoot their nets.

The witness withdrew.

Rev. F. Ashhurst.

The Rev. FREDERICK ASHHURST called and examined.

1659. (*Mr. Caird.*) Are you the incumbent here, Mr. Ashhurst?—No, I am only the curate of the parish.

1660. How long have you been here?—Altogether about three years. I left here in the year 1860. I was here from 1857 to 1860.

1661. When did you return again?—This year, in 1863. I began in January.

1662. In your observation of the condition and the comforts of the population, can you tell us if there has been any falling off, taking this year and comparing it with the year 1857?—I do not know that there is.

1663. Do the people seem to be as comfortable and as well to do as they used to be?—From what I have seen in visiting here, the people seem to live in the same way they did before.

1664. Has there been any increase of sickness, or has there been any diminution?—I can hardly answer that; there has been a great increase in the population, and there are a great many more people fishing than there were some years ago. Those who were young men then are now fishing for themselves.

1665. I suppose it is the custom for the young men of a family to become fishermen?—Yes.

1666. They do not go away and settle in other places?—Hardly any of them leave the place; they stick very much to it.

1667. And the population has increased?—Yes, very much indeed.

1668. (*Professor Huxley.*) Are you much troubled with the typhus or other fevers here?—No, I think not.

1669. Have you any notion of the extent of the poor rates here?—I cannot answer that question.

1670. You do not happen to know?—No.

NEWBIGGIN.

Rev. F. Ashhurst.

23 Sept. 1863.

1671. Do you imagine that they are particularly heavy ?—No, I think not ; I have no reason for saying that they are.

1672. (*Mr. Lefevre.*) Can you form any estimate of the earnings—the average earnings of the fishermen here ?—No, I cannot ; I have not sufficiently considered the question. This is a very large parish, and I am only here occasionally.

1673. Can you form any estimate as to the wages of the men compared with what the colliers and men working at other trades get ?—No, I am not sufficiently acquainted with them to make the comparison.

The witness withdrew.

(*Mr. Caird.*) We have now gone through the list of witnesses ; but if there is any fisherman present who desires to add anything to the evidence already given, or to offer any suggestions, or make any corrections, we shall be most happy to hear him.

W. Renner.

William Renner examined.

1674. (*Mr. Caird.*) What are you ?—I am a buyer of fish and I catch them too. I both buy and catch.

1675. What do you do with them when you buy them ?—I send them to different markets, some to Manchester, some to London, some to Birmingham, some to Liverpool, and also to other towns.

1676. Have you been several years engaged as a buyer ?—No, I have not been engaged in that business many years.

1677. When did you begin to buy ?—Not more than three or four years ago.

1678. Do you buy a large quantity of the fish caught here ?—Sometimes I buy a large quantity, and occasionally the great majority of the fish taken here.

1679. Have you noticed whether there has been any diminution in the quantity offered for sale here by the fishermen ?—Yes, there is a vast deal shorter take than there used to be.

1680. Can you not get as many fish when you go down to the shore after a day's fishing as you used to get ?—We do not buy so much, but there is sometimes a wonderful day's fishing. It is a very fluctuating thing. Sometimes there will not be above two or three stone of haddock in a boat, and at other times there will be 15 or 16 stone in a boat ; there is that difference in the fish we buy now, haddock and cod.

1681. Are the haddock as large in size now as they used to be ?—No, they are a great deal smaller, they are not nearly such fine fish as they used to be.

1682. Are they not as large as they were four years ago ?—There are some that are as large, but the general quantity of them are not to be compared in size to what they used to be.

1683. You are speaking only of four years ago ?—They are diminishing every year.

1684. Are the cod-fish diminishing in size, or are they about the same ?—They are diminishing; there is not near the quantity of cod that there used to be.

1685. But with regard to the size, how is that ?—They are generally smaller than they used to be ; they used to be very fine fish.

1686. Do you notice a greater diminution in the size of the haddock than of the cod ?—There are a great deal caught inferior in size compared with what they used to be in the haddocks.

1687. But there is not so much difference in the cod ?—No, not so much as in the haddock.

1688. In any of the other fish which are caught here is there any considerable diminution in the size ?—No, not so much difference; there is more difference in the haddock than in any other. The fish we take here are a great deal smaller than they used to be.

1689. What was the price of a stone of fish on the beach four years ago ?—1*s.* 6*d.*, 2*s.*, 2*s.* 6*d.*, and sometimes it was as high as 3*s.*

1690. Has that price continued about the same during the last four years ?—Yes, I have not seen much difference in the price.

1691. What is it as compared with what it was 15 years ago ?—It was not near so much, but then the takes were a good deal larger. Every year they grow scarcer and scarcer, and we attribute the falling off to the trawlers taking away the spawn and destroying the small fish.

1692. (*Professor Huxley.*) How much was the price then ?—Sometimes 1*s.* 3*d.* a stone. They are all sold in this port to the pannier men. They are all sold in that way ; they just get them at so much a pannier. They ask 30*s.* or 40*s.* sometimes, and 10*s.* or 15*s.* at others. Sometimes they ask 30*s.* or 2*l.* for a lot of fish. Occasionally we will give them what they ask, and sometimes we may offer them 20*s.* or less.

1693. (*Mr. Lefevre.*) Do you attribute the diminution of the fish to the trawlers taking the spawn ?—We attribute it to that, and nothing else.

1694. Have you been on board one of these trawlers yourself ?—I never saw one.

1695. Then on what do you ground your notion ?—I really believe that if the men go and set down all their lines they will get nothing if these trawlers happen to be there ; and if they are to continue they will destroy all the fish. If the long lines are in the water when the trawlers come all the gear will be destroyed. There is no getting in between two of them, because sometimes the lines are not 100 yards apart, and yet they shoot east and west of them and destroy all that they come across.

1696. How is it that you come to the conclusion that it is the trawlers who take the spawn ?—I was informed by a man I know who lives at Sunderland that he has seen different trawlers come in with spawn in their vessels. On one occasion he saw a ton and a half offered for sale. You know if you destroy the spawn at the bottom of the sea the fish will never come to life again.

1697. I suppose that is the story of Templeman with regard to the sale of the ton and a half ?—No; my son has been fishing here and he has seen the same thing.

The witness withdrew, and the inquiry was adjourned to Thursday, September 24, at North Sunderland.

North Sunderland, Northumberland, Thursday, 24th September 1863.

Present :

James Caird, Esq., M.P. (Chairman). | Professor Huxley, F.R.S.
G. Shaw Lefevre, Esq.

NORTH SUNDERLAND.

J. Patterson.

24 Sept. 1863.

John Patterson called and examined.

1698. (*Mr. Caird.*) Are you a native of North Sunderland ?—I am harbour-master here, and I have been in that position for four years gone February.

1699. Have you yourself been engaged in the fishery here ?—Yes ; I have been 21 years in the place myself.

NORTH SUNDERLAND.

J. Patterson.

24 Sept. 1863.

1700. You have had 21 years' experience of the state of the fishing in this harbour?—Yes; I was a fisherman at Newton previous to that.

1701. What kind of fish do they principally catch off this coast?—We have cod, ling, and turbot (but they are nearly extinct on this coast now), skate, sole, and a very few haddocks. I believe those are the principal fish caught here.

1704. In the course of the 21 years over which your experience has extended here, have you noticed any change in the quantity of fish brought on shore by the boats?—Yes, there are not so many brought now as there were in former years.

1705. Has the number of boats increased or diminished?—As regards the white-fishing the number of boats I believe has increased.

1706. Do you remember what they were 21 years ago?—I cannot recollect.

1707. Can you recollect what they were 10 years ago?—I think the white-fishing boats would be somewhat similar now.

1708. Then they have not increased or diminished?—No, except perhaps one or two boats.

1710. Are they about the same size?—Yes.

1711. And do they carry about the same quantity of lines and the same number of men?—No, they did not carry so much line formerly.

1712. Then the extent of the line carried by each boat has increased of late years?—Yes; we formerly had 400 or 500 hooks, and they have now extended from about 800 to 1,000 hooks per line.

1713. How many men are there in a boat?—There are three in some boats and four in others.

1714. Do you find that the quantity of fish brought on shore now on an average from each boat has considerably diminished within your knowledge?—Yes.

1715. What kind of fish chiefly has diminished?—Haddock, cod, and ling.

1716. Has the diminution been in the quantity alone, or in the quality and size as well?—Well, I do not think that the cod and ling have been as large as they were seven or eight years ago.

1717. Is there any marked falling off in the size?—I should not say that there is.

1718. Is the haddock as large as it used to be?—It is as large on the south part of the island, but not on the north part.

1719. Can you say whether upon the average the haddock brought on shore here is as large and fine as it used to be in former years?—No, I think not.

1720. Can you not speak positively upon that point?—Yes; they are not as large as they were a few years ago.

1721. Is there much difference in the size?—You may get an exceptional haddock now and then.

1722. But taking the whole boat's catch?—Then I should say that the haddocks are not so large as they were.

1723. And with regard to the number of the fishermen, have they increased?—Yes.

1724. I understood you to say that the turbots were not nearly so numerous as they used to be?—No. That was a fish that was very productive at one time, and very profitable to the fishermen.

1725. When did they begin to fall off in a marked manner?—There has been no turbot-fishing about here for these 16 or 18 years, but just off to the south they follow it in the latter part of the herring-fishing.

1726. That is not off this harbour?—No.

1727. None of your fishermen fish for turbot now as they did formerly?—No, they do not.

1728. Did they within your knowledge?—Yes, I have fished for turbot myself.

1729. Was there a good deal caught formerly?—Yes; I have caught 100 in a day, myself.

1730. To what do you attribute the falling off?—I cannot say what has occasioned the falling off on our grounds.

1731. Is there no cause to which you can assign it in your own mind?—It might have been occasioned by the trawlers, or it might be attributed to other things. We do not know what route the fish take when the spawn comes to life. There has been no trawling on this coast in my time.

1732. You say that the falling off took place 18 years ago?—Yes, somewhere about that time.

1733. And there has been no trawling about here during the last few years?—No.

1734. Can you state the time when the falling off in the size and quantity of the haddocks took place?—No, I do not think I can state the time.

1735. Is there any cause to which you attribute the decline in the haddock-fishing?—Well, there has been a diminution in the haddocks, that is all I know.

1736. You cannot assign any reason for it?—No, but I principally attribute it to the trawling.

1737. But I understood you to say that there has not been any trawling off your coast?—No, there has not.

1738. There has never been any?—Not in my day.

1739. Then if there has been no trawling off your coast how can you attribute the falling off in the fish to the trawling?—Why we do not know what route the fish take when they take life.

1740. Have you perceived any difference in the number of the fish brought upon the shore by any change of wind?—We like an easterly wind for bringing the fish in upon the grounds.

1741. A north-easterly wind, or a south-easterly wind, which is the most favourable?—A south-easterly wind we like best, a north-easterly wind drives all the fish off the shore.

1742. Do you speak of that from your own observation? Are you enabled to say that at the present time a south-easterly gale will bring in more fish than a north-easterly gale?—Yes, I speak from personal knowledge.

1743. And that statement applies to the present time, does it?—For the last five years I have not followed the white-fishing.

1744. Then you do not speak of what happens now?—No.

1745. Is there any difficulty in obtaining bait here for the long-line fishing?—Yes, we have great difficulty in getting bait here.

1746. What bait is used?—Mussels.

1747. And where do you get the mussels from?—From Boston Deeps, Stockton, and from Port Glasgow.

1748. Port Glasgow on the Clyde?—Yes, on the Clyde. We find that we can get them cheaper than from Port Glasgow now. There used to be a mussel bed here before my day, but the mussels were ploughed up by the farmers, and since then they have been on the decrease so that it has not been worth while to get them.

1749. You say that that occurred before your day? Then it would be more than 20 years ago?—Yes.

1750. You state that a mussel bed was ploughed up by the farmers?—Yes.

1751. And that since then the supply of mussels from that bed has greatly decreased?—Yes.

1752. Are there no mussels there now at all?—There are a few.

1753. The bed has not been ploughed again, has it?—No, not to my knowledge.

1754. There has been no repetition of that?—Not to my knowledge, but the mussels have never gathered there since then.

1755. What do the fishermen pay for the mussels?—About 30*s.* per ton.

1756. That is the expense, after paying the railway carriage, of obtaining mussels from Port Glasgow? They cost 30*s.* per ton delivered here?—Yes, from 28*s.* to 30*s.* per ton.

1757. What do you pay for them from Boston Deeps?—I am sure I do not know, but there are some fishermen here who can tell you.

1758. Is there a large quantity imported altogether

for the use of the fishermen?—Yes, they import all they use.

1759. Have you any idea what quantity in weight is used by the fishermen here?—I cannot give you an accurate statement with regard to that.

1760. Has the difficulty of obtaining bait been gradually increasing?—Yes.

1761. Has the price of bait increased?—I think it has. Small ships used to come here and sell the mussels at 1*s.* per bushel from Boston.

1762. Does there seem to be a plentiful supply from Port Glasgow, and is it likely to continue?—They seem to think that there is likely to be a falling off there. The fishermen are of opinion that they do not get such fine mussels as they used to get. The mussels are not so good as they were formerly. Of late years they have been very small.

1763. Are there any salmon or salmon trout caught on this shore?—There are a few, but it is only a very few.

1764. Are there any salmon caught?—No, salmon trout.

1765. No salmon?—No.

1766. How are the salmon trout caught?—They are caught in the net.

1767. By a drift net or by a seine net?—They shoot them with corks.

1768. Do they draw them to the shore?—No, they are taken on board the boats.

1769. (*Professor Huxley.*) They are a kind of circle net, are they not?—Yes; they shoot them out in a sort of circle.

1770. (*Mr. Caird.*) When does that fishing begin and terminate?—They start in June and they leave off in the beginning of July.

1771. Are there any mackerel caught off here?—There are a few but they do not see many. They do not use mackerel nets here. the few they get are caught in the herring nets.

1772. Do they think it would not pay to try to catch mackerel?—I suppose they think it would not.

1773. Do not large quantities of mackerel come in here?—I have seen very heavy shoals here at times.

1774. Are there any sprats off this shore?—No.

1775. Are there any shell-fish?—Yes, there are lobsters and crabs.

1776. Are they caught in considerable quantities?—They are not as abundant as they used to be. The lobsters in particular are falling off.

1777. What do you think is the cause of that?—I believe all sorts of fish destroy the lobster spawn. There are a great many lobsters taken, too, when they ought not to be taken,—'berry-hens' as we call them.

1778. You think they are fished more closely during the whole season than they ought to be?—Yes; and we have different machines now for taking the lobsters; they take them cleaner off the ground than they used to do.

1779. Do you find that you are gradually impoverishing the lobster ground?—Yes, I think we are.

1780. Do you think the time will come when you will bring the lobsters to an end altogether?—It looks very like it.

1781. Do the crabs continue equal to the former supply?—Yes, but for part of the year they are not good in quality.

1782. Then I presume they are not saleable?—Yes, they all manage to get quit of them here, but there are great cries about their not taking the market well in the fore part of the year.

1783. Are there any regulations on this coast as to the seasons for fishing the different kind of fish, and with regard to the size of the nets?—I believe there is a fixed size for the herring nets; they are not to be below an inch.

1784. Where did these regulations come from?—I believe they came from the fishery board.

1785. Do you mean the fishery board in Edinburgh?—Yes.

1786. Do you hold yourselves liable to obey those regulations?—We do obey them in point of fact. It would not do for us to have our meshes any less.

1787. Have any other regulations been enforced here?—No, not that I am aware of.

1788. With regard to the herring fishery, is that increasing in its produce or is it decreasing?—It is diminishing.

1789. Have the boats been increasing or decreasing within the last 10 years?—They have not been increasing very rapidly. We had in 1856 51 native boats and now we have 48.

1790. Do you mean boats engaged in the herring fishery?—Yes.

1791. I believe you have a different kind of boat for the line-fishing?—Yes, a line-fishing boat is quite different from a herring-fishing boat.

1792. What number of those boats had you in 1856, and what number have you now?—There will be about 12 now.

1793. What number had you in 1856?—I cannot exactly say, but I should say that there would not be a difference of more than two or three in the number of those boats then and now.

1794. Are the same men engaged in both fisheries?—We have occasionally strange men coming for the herring fishery.

1795. Do you include these strange men in the number you have given me?—The strangers have nothing to do with the boats. They come to fish in the native boats.

1796. Is the herring fishery on the whole a more productive fishery to the fishermen than the line fishery?—Yes, I think it is.

1797. And the herring fishery extends over about two months?—Yes, from two months to nine or ten weeks.

1798. How long does the line-fishing continue?—It goes on all the early part of the year.

1799. And yet there is more money received from the two months or 10 weeks' herring-fishing than from all the rest of the year?—Yes.

1800. Then the falling off in the herring fishery is a more grievous matter than the falling off in the white-fishing?—Yes. I believe it is well known that the French fishermen come and take a large portion of the fish away.

1801. Then the falling off is not attributable to the decrease in the quantity of herrings, but to the fact that strangers come upon your grounds and take a share of the fishing?—The Frenchmen are there so constantly that sometimes we cannot get upon the fishing ground at all.

1802. Can you form any idea as to what quantity of herrings the Frenchmen catch?—No, we do not know what they take away.

1803. You cannot tell what proportion of the herrings caught upon your coast now is caught by the Frenchmen?—I should say that three fifths of them are taken by Frenchmen. If a shoal of fish comes in within five or six miles from the shore the Frenchmen immediately shoot their nets there; the next morning they bring up to an anchor on the ground, gut their fish on the ground, and heave the refuse overboard. They stop the fish from coming in to the shore. As soon as our boats leave the harbour the French immediately shoot their nets and the consequence is that our boats must either keep inside of the shoal of fish or go outside of them.

1804. Do the Frenchmen watch your boats and take their coming off as a sign for shooting their nets?—Yes, I believe they do.

1805. Within what limits do the French come?—They come within a mile, although three miles is their limit; but if I had my way I would extend it to six miles, and put a very heavy fine upon them if they came within it.

1806. Within what distance of the shore are the shoals of herrings generally?—They have not been in-shore for the last five or six years; they do not come in at all as they ought to do.

1807. Then at what distance from the shore are

NORTH SUNDERLAND.

J. Patterson.

24 Sept. 1863.

they generally taken?—There are good takes of herrings five miles off.

1808. Is that where the strongest shoals are?—They begin to show themselves at that distance.

1809. Has there been any interference with the French fishermen on the part of the Government vessels?—The Government vessels have never looked at them this year at all.

1810. Have they been as numerous here this year as they have been before?—Yes, they have been quite as numerous.

1811. Has there been any collision between the French fishermen and your fishermen?—Yes.

1812. Do your men get their nets damaged?—Yes, they are sure to do that when they come in contact with the French. The French boats carry very heavy nets; their boats are much heavier fitted up than ours.

1813. Do any other English fishermen or Scotch fishermen come here?—Yes, the Yarmouth boats come here, and they are more heavily fit up than ours.

1814. Are they as heavy as the French boats?—I scarcely think they are so heavy as the French boats.

1815. Do you then attribute part of the damage done to the fishing not only to the French boats taking the fish, but to the French frightening the fish by throwing over the refuse when they gut those which they have taken?—Yes, I think it prevents the herrings coming to the shore.

1816. But would it not damage their own fishing as well?—Yes, but they do not care for that while they are on our fishing ground. For four or five miles, off and on, they will take the ground up, and they will shoot their nets in the middle of the afternoon.

1817. Do you consider yourselves bound not to shoot your nets until after sunset?—Sometimes they are shot before sunset but only to get into a berth.

1818. Do you think it of importance, to prevent the breaking of the shoals and frightening the fish, that you should not shoot your nets until after sunset?—I would not do so if I thought the ground was clear for getting a berth.

1819. Do you think the fishermen here generally adopt that plan?—That has been the plan generally adopted all my day.

1820. Do the French observe that regulation?—No. They will shoot their nets at two in the afternoon.

1821. They do not hold themselves bound to wait till after sunset?—Not at all.

1822. Do they fish upon certain nights when you do not fish?—Yes, upon Saturdays and Sundays.

1823. Do you fish on those nights at all?—No, some of the boats go out on a Sunday night.

1824. Then there is one day a week at all events that you do not fish?—Yes, there is always one day a week that we do not fish.

1825. And the French do fish on that day?—Yes.

1826. Do you think it would be of any advantage if a regulation were established applicable to all the fishermen that they should not be allowed to shoot their nets till after sunset?—I have no doubt that it would do a great deal of good; it would help us to keep the French off the ground.

1827. But that is another question?—I do not know but that it would do good.

1828. Would you desire it if the question were put to you; do you think it would be an advantage for the general fishing of this place, and for the interest of all the men engaged in it, that such a regulation should be enforced?—Well, I think so; no advantage can be gained by shooting the nets before sundown.

1829. Is there any other regulation that you think could be adopted with advantage to the general interests of the fishermen?—I cannot say.

1830. You do not desire any interference on the part of any fishery board?—I should like the fishermen to be looked more after, and for the Government to send their cruisers to keep the French off. I do not want to fine them but to impound them for 30 days during the whole of the season. A fine of 5*l.* or 6*l.* is a mere nothing. There are perhaps two fishing boats, and a cruiser goes and takes one and fines it 5*l.* or 6*l.* Why they do not care a bit for that, not at all; but if you were to impound them for the season, or for not less than 30 days, I think that would put an end to our grievances with regard to the French.

1831. Then you look to the French as doing the most serious injury to this fishing?—Yes, we do.

1832. How many boats go out at once with herring nets from this place?—Do you mean how many boats go out belonging to this place?

1833. Yes, I mean all the boats that come here, not including the French?—Well, we have had 87 or 88 boats here this year. There have been some Scotch boats that have come here for the season as well as our own native boats.

1834. What length of nets will each boat put out?—From 20 to 30 nets.

1835. And what will be the length of those nets?—40 yards; on the rope from 48 to 60 yards.

1836. Will they average 40 yards on the rope?—The least would be that length.

1837. Then the length of the whole of the nets will be about 1,200 yards to each boat?—Yes, somewhere about that.

1838. And there are about 80 of these boats, you say?—We had 80 odd this year.

1839. Are the nets set across the run of the tide?—It depends on the wind; if the wind is westerly they shoot off from the tide, if north or south they would shoot with the tide.

1840. Are they set in parallel lines?—No, they have to set them zigzag sometimes.

1841. They will cover a great space of ground, will they not?—Yes, but the nets of the Frenchmen cover far more ground.

1842. Are there any existing laws connected with the fishery that do any injury to your fishing?—I cannot say that there are.

1843. There is nothing that interferes with you in any way? No one comes here and prescribes how you are to fish?—No

1844. You have nothing of that kind to complain of?—No.

1845. Has the condition of the people here improved or fallen off during the last 10 years?—I do not think there is much improvement.

1846. Do you think that there is any decline?—I cannot say exactly.

1847. Do you think the people are as comfortable in their circumstances as they used to be?—I know of very little difference for my part.

1848. Has not the price of fish very much increased?—It has much increased, owing to the railroad coming here—that has brought the prices up.

1849. Will a man get as much now for his small boat's catch, in consequence of the increased price, as he used to have for the large boat's catch at a lower price?—Scarcely.

1850. Will the fishermen, on the average, make as much money now as they did 10 years ago?—No, I think not.

1851. Can you give me any definite idea of the difference?—They do not get as much money now as they did a few years ago.

1852. Have the fishermen any other occupation except fishing here?—No, they have not.

1853. They do not go to farming or to work in the fields?—No.

1854. (*Professor Huxley.*) You were speaking of the sunset regulation just now; what is your reason for wishing to have it; why do you think that it would be a good thing to prevent people from putting down their nets before sunset?—I think that some regulation of that kind would keep the Frenchmen off.

1855. But do you think that it injures the shoal of fish to shoot the nets before sunset?—I do not know that, but the boats at sea have a double chance to what the boats in harbour have.

1856. I am speaking of what the effect would be on

a shoal of fish. If a man were to shoot his nets before sunset among a shoal of fish do you think it would tend to disturb the shoal?—I do not think that the fish would rise as well,

1857. Have you ever seen anything of this kind take place. Have you ever seen a shoal broken up in consequence of the nets having been shot before sunset?—I have seen many times when the boats have got down that the fish have never risen at all.

1858. That will happen sometimes at night, will it not?—We sometimes think it is occasioned by the tide being too strong or the moon too bright. We think that causes them not to rise sometimes.

1859. Have you ever seen a shoal of fish disturbed in consequence of the nets having been shot before sundown?—I could not say that I have.

1860. Suppose the Yarmouth men were more abundant than they are now; suppose they came here in great numbers, with heavy boats and tackle, could your men fish among them?—They could at a distance.

1861. But could they go among them and fish?—No; their vessels are heavier than ours, and would destroy our nets.

1862. Then the Yarmouth men would be as bad for you as the Frenchmen?—Yes.

1863. Would you have any restriction put upon the Yarmouth men?—I believe that by Act of Parliament a decked boat must keep half a mile from an open boat.

1864. Do you want to have the same regulations applied to the French boats as are applied to the Yarmouth boats?—Yes.

1865. You do not want any different regulations for the French from those which you have for the English?—I think the French should be restricted from coming within six miles of the shore.

1866. You would not keep the Yarmouth men six miles out, would you?—No, we could not do that.

1867. Do you wish to do so?—Not at all; they have to make a living on the sea as well as our own fishermen.

1868. Then what would apply to the Yarmouth fishermen you do not think would apply to the French fishermen?—No, the Yarmouth men are Englishmen as well as we; but I think it would be a hard case for us that foreigners should be allowed to come in and take the fish off our ground.

1869. Have you ever seen herrings here in January or February?—I have never tried for them then.

1870. Have you ever seen any here. Have you ever seen what is called the 'appearance' of herring then?—No.

1871. You said just now that you thought other fish ate the lobster spawn?—Yes.

1872. How do they contrive to do that?—I have seen them in the fish; I have taken lobster spawn out of them.

1873. Then the lobster must have been dead?—I have seen it down about the island.

1874. Do you know that the lobster carries her spawn about with her under her belly?—She does not carry it always.

1876. When she lays them she fastens them all to her belly and carries them about as a mother does her children?—All that I know is that I have seen lobster spawn in the fish we have caught.

1877. Has that occurred frequently?—Yes, many a time.

1878. Then they must have killed the lobster first?—Yes, very likely.

1879. Can you suggest any means of improving the supply of bait?—The bait should be got and preserved on the stakes north of Bamborough Castle. If a shipload of mussels were brought there and preserved I think it would keep all our fishermen in bait.

1880. Do you mean to say that you would establish a sort of mussel park like an oyster park?—Yes.

1881. Do you think that that would supply you with enough bait?—Yes, if it were properly preserved, and strange boats were not allowed to take it away.

1882. Would it be a costly process to construct a mussel bank in that way?—No, I do not think it would.

1883. Would it be necessary to do anything for the protection of the bed? Is there a natural bay?—Yes, there is a natural bay.

1884. You would stock the bay with mussels and have them preserved, and I presume sold at a small rate, in order to pay the expense of keeping the bank up?—Yes.

1885. Then you think that such a bed would suffice for the whole of this place?—Yes.

1886. Do you happen to know the time of year at which turbot spawn?—No.

1887. Have you any notion where the turbot spawn about this coast?—No.

1888. Do you know where the white fish spawn?—I believe they go off into deep water.

1889. Have you any reason to believe that they go south or north to spawn, or where they go?—I cannot say where.

1890. You have no precise knowledge about that?—No.

1891. You have never heard it said where they spawn?—No.

1892. Is there any tradition about it among the fishermen?—No.

1893. Have you been a line-fisherman yourself?—Yes.

1894. I believe you lose a good deal occasionally by the dog-fish?—Yes.

1895. Have you made any estimate of the amount of loss that takes place in consequence of the dogfish?—I have seen one third of the fish taken away by the dog-fish.

1896. Have you ever seen the whole of the fish taken away by dog-fish?—I cannot say that I have ever seen more than one third; I have sometimes seen less.

1897. It commonly happens that it is less?—Yes.

1898. Sometimes I suppose the lines are not touched at all?—Sometimes; occasionally we have lost a third, and the last line or two we may haul in we find all the fish gone altogether; that generally takes place in the fore part of the year.

1899. If the most ever taken is one third, would one sixth or one seventh be the average loss, taking all the year round?—Yes, I should say perhaps one seventh.

1900. Do you happen to recollect what was the price of the fish brought to the shore here 10 years ago?—No.

1901. What did haddocks fetch then?—I cannot say.

1902. You do not happen to recollect?—Not accurately. I think the haddocks would fetch nearly as much then as they would now; 13*d.* or 14*d.* a stone.

1903. What would they bring 20 years ago?—About 10*d.* a score I think it would be then for haddocks.

1904. And what would that be a stone?—There would be three stone to the score; I have caught them myself and sold them at that price.

1905. Then you did not get one fifth of the price 20 years ago that you do now?—Nothing like it; but since then the railway has passed through.

1906. Then the railway by causing a greater demand for fish has increased the price?—It has equalized the price in the villages along the coast. Cullercoats for some time had always commanded a higher price, being nearer a market town.

1907. Does that increase of price apply to all white fish?—Yes, all white fish.

1908. It has not affected herrings?—I think they are rather on the decrease; this last year or two they have been about 1*l.* a barrel.

1909. But the price of white fish has increased four or five times during the last 20 years.

1910. (*Mr. Caird.*) Is the bay you mentioned where you think mussels should be planted used for any other purpose?—No; the people gather cockles about the bay.

NORTH SUNDERLAND.

J. Patterson.

24 Sept. 1863.

1911. But is there plenty of space upon which to plant a mussel bed?—Yes.

1912. Then is it nobody's interest to do that?—Nobody has done it yet.

1913. The proprietor has not thought it worth his while?—Nothing has been done. I believe that part of it belongs to Earl Grey.

1914. Is there any dispute as to whether the foreshore belongs to the proprietors of the land or to the Crown?—I never heard of any dispute.

The witness withdrew.

T. Pringle.

THOMAS PRINGLE called and examined.

1915. (*Mr. Caird.*) Are you a native of North Sunderland?—Yes.

1916. Have you been a fisherman here all your life?—Yes.

1917. Do you practise all the kinds of fishing that are practised on this coast?—Yes, I follow all the different kinds of fishing.

1918. Line-fishing, herring-fishing, and fishing for shell-fish?—Yes.

1919. Do you fish for soles?—No, we never try for soles here.

1920. There is no trawling for soles here?—No.

1921. How many years have you been familiar with the fishing here?—All my life.

1923. Did you hear the evidence of the previous witness?—Yes.

1924. Do you agree with him that there has been a gradual falling off in the quantity of fish caught off this coast?—Yes, I quite agree with him.

1925. And do you think that the quality of the fish has decreased in your time?—The fish are not so large as they were.

1926. In what kind of fish do you notice a perceptible decrease; which of them have become smaller?—Haddocks are a good deal smaller, and turbot-fishing has disappeared.

1927. Has it disappeared entirely?—Yes.

1929. Have you noticed any difference in the quantity of the fish brought here after a south-east gale, and after a north-east gale?—We like a south-east gale for fishing on this coast better than a north-east gale.

1930. There has been no deep-sea trawling off your coast yet?—Not that we have seen.

1931. You have never yet seen a trawler off your coast so far north?—No.

1932. To what do you attribute the falling off in the line-fishing?—We blame the trawlers for taking away the spawn of the haddock in the deep water; we cannot think of anything else.

1933. On what part of the coast do you think that that injury is done?—We think that the fish come from the deep sea, and that the trawlers outside trawl up the spawn and destroy it.

1934. But you said that there were no trawlers here?—But on the south side there are plenty of them off the Yorkshire coast.

1935. Yet you say that the south-east gales bring you in more fish?—Yes, the haddock comes from there.

1936. Do you find much inconvenience in consequence of the want of bait?—Yes, a great deal occasionally.

1937. Is the price of bait increasing?—It has increased during the last three years.

1938. What did you formerly pay for it?—We paid 28*s.* for it from Port Glasgow; last year we paid 32*s.*

1939. Is there a large quantity brought from port Glasgow?—Not last year, but the year before that there was. For a few years past it has been diminishing.

1940. What is the reason there has been a falling off; do you get it cheaper elsewhere?—We pay about 28*s.* for it from Boston, when the vessels call with it.

1941. How much bait will each boat use in the course of the fishing season?—Four men will use about 30*s.* worth in one boat in the course of a month.

1942. That would be about a ton?—Yes.

1943. How many months in the year do you fish?—We fish all the year, except during the time of the herring-fishing, but we do not use so much bait all the year round. When we go regularly catching haddocks we use about a ton a month.

1944. Do you think that you use about six tons a year?—Yes, I should say we do.

1945. And that would cost you between 9*l.* and 10*l.*?—Yes.

1946. How many boats are there employed in the line-fishing?—I can hardly tell; about 12, I think.

1947. Have you noticed that the herring fishery has fallen off in quantity?—Yes.

1948. How long is it since that became appreciable?—During the last five years it has been less than it was before.

1949. Does it not vary very much? Is not the herring fishery good one year, another year middling, and another year very bad?—Yes.

1950. But during the last few years it has been falling off every year?—Yes, it has been falling off every year.

1951. Have you any reason to assign for that?—I can blame nothing but the French.

1952. Do you suppose that the trawlers do any part of the damage here?—We cannot tell; we do not think they do.

1953. Do you think that there are as many herrings off the coast as there used to be?—Strong shoals come in occasionally, but we have no chance with them.

1954. Then it is not because the herring has decreased, but because the number of people to take them has increased, that you do not get so many?—Yes.

1955. And the increase has been chiefly in the number of French fishing boats?—Yes.

1956. Do you agree with the previous witness that two thirds of the herrings are taken away by the French?—Yes, I think so.

1957. Would it be advantageous to establish a regulation not to permit the nets to be shot before sunset?—Yes, I think it would.

1958. Would it be of advantage to yourself, as a fisherman, if everybody had to do that?—Yes, it would give us a chance with the French.

1960. Is there any suggestion you can make that you think would be of advantage to your fishing here?—I cannot tell, unless it is in regard to the French. I do not know that anything else would be a benefit.

1961. Is there any restriction at all that operates upon you—any legal restriction that prevents you from fishing as you would like to fish?—No.

1962. Then you are not interfered with in any way?—No, we are not interfered with.

1963. What does a boat cost, one of those full-sized herring boats?—A full-sized herring boat will cost about 80*l.*

1964. And the nets and tackle, and everything ready for fishing; how much will everything come to?—I should say it would cost about 200*l.*

1966. And how much would be required to keep that good every year?—That would depend upon the losses you might sustain. If you did not come to any loss I do not think it would take much during the first three or four years to keep the boat good.

1967. After that it would begin to cost more?—Yes, after that the boat would begin to want repairs; not the nets.

1968. Can you form any estimate as to what the cost on the average would be, taking the period which a boat might be estimated to last?—I can hardly give you any idea. Taking an average, it would

Perhaps cost 5*l.* to keep the boat up. I mean the boat alone without the nets.

1969. What do you suppose it would cost to keep the nets ?—It would not cost much if you did not lose them. You could repair them yourself.

1970. You take your chance then with regard to that. What would it cost do you think on the average ?—I cannot say, perhaps 5*s.* a net will keep the nets good.

1971. How long will the boat last on an average ?—A boat will last about 20 years here. In other places she will last much longer.

1972. Do you find that with the higher prices which the fish bring now, although you are catching fewer of them practically, you are as well off as you used to be ?—No I think we are hardly as well off.

1973. You do not think you are ?—I do not think that we make as much money as we did a few years back.

1974. (*Professor Huxley.*) Do you agree with what the previous witness said about the difference in the price of fish 20 years ago ?—Yes.

1975. The price of white fish on the average is four or five times greater now than then ?—Yes ; four or five times greater.

1976. Did you hear what we were saying about the establishment of a mussel park ?—Yes.

1977. Do you think that that would be practicable ?—Yes, I think that that would be an advantage.

1978. Would that supply you with sufficient bait if it were properly regulated ?—Yes, I think it would.

1979. You think it would supply you with 60 or 70 tons of mussels in the course of a year ?—Yes.

1980. Have you any notion where the white fish spawn ?—We think they go off into deep water and spawn there, but I cannot tell you where.

1981. Do they go north, south, or east ?—That is a mystery.

1982. You have no particular reason for thinking that they go to either the one or the other ?—No.

1983. Have you heard of or seen any herring here in January or February ?—No.

1984. What do you think of the sunset regulation—the prohibition from shooting your nets before sunset. I do not put the question in reference to keeping you free from the French, but do you think that shooting the nets before sunset damages the shoal ?—I think it would be a good plan not to shoot before sunset.

1985. Do you say that because it would give you a fair start with the French ?—Yes, perhaps it would hurt the shoal of herrings if we were to shoot our nets long before sunset.

1986. You think it would. Have you seen it take place ?—No.

The witness withdrew.

William Spears called and examined.

W. Spears.

1987. (*Mr. Caird.*) Have you been long a fisherman here ?—I have been 13 years a herring-fisherman here.

1988. Do you not follow the line-fishing also ?—Yes, I have been six years a line-fisher.

1989. In the six years you have been line-fishing, have you noticed any diminution in the quantity of the fish ?—When I started first the fish were much more plentiful than they are now : we get larger prices now, but not so many fish.

1990. Speaking of your own boat, how many would you bring ashore six years ago in one day's fishing ?—From 30 to 40 stone.

1991. Was that a good fishing, or average fishing ?—We considered it an average.

1992. What do you get now ?—From 10 to 15 or 20 stone. About 15 is as much as we can get on an average.

1993. Is there any diminution in the size of the fish as well as in the quantity ?—I think the fish are smaller than they were when I first went to the fishing.

1994. What kind of fish do you refer to ?—Halibut, haddock, cod, and ling ; there is not so much difference perhaps in the ling and cod ; it is principally in the halibut and haddock.

1995. With regard to the herring fishery you have had a longer experience of that ?—Yes.

1996. Do you notice any falling off in the quantity ?—Yes, we have been successful in some years, but this year and the last year we have been lessening yearly. I think it is the French that is the cause of the falling off.

1997. What would be the produce in money now of one boat in a successful season ?—From 100*l.* to 120*l.*

1998. That would be a boat with four men ?—Yes, four men and 25 nets ; that would remunerate us for our services if we got that.

1999. What would you get last year ?—We should not average more than 65*l.*

2000. Has the price of herrings remained the same ?—No, it has greatly fallen off. We had 1*l.* a barrel two years ago ; last year it was only 16*s.*, and this year it has not averaged more than 13*s.* That is owing to the markets being bad.

2001. With that difference in price, you must have caught as many fish as you caught two years ago ?—No, I have had 45 cran of fish this year.

2002. How many fish is there in a cran ?—It will depend on the size they run to. It will average from 600 to 800.

2005. Do you think as many herrings come off the coast here as used to do ?—I believe that the fish cannot get on to our coast for the French fishermen.

2007. Do you think that the fish have decreased, without reference to those which are taken by other people ?—Yes.

2008. Then the fish have decreased from various causes ?—Yes, but I think the French fishing boats are the greatest evil ; the fish cannot get on to our coast in consequence of their boats lying off the shore. They gut the fish that they have caught the night before and throw it overboard, and that keeps a lot of dog-fish around them, and the fish cannot get in.

2009. Do the dog-fish frighten away the herrings ?—I have no doubt that they injure the fish. They get into the nets and eat the herrings out after they have got in.

2010. Where do the herrings go when they leave your coast ?—I am of opinion that they go south, but we cannot tell.

2012. Do the same French fishermen come to you as go to Cullercoats and Newbiggin ?—Yes.

2013. Are they the same boats ?—Perhaps they are here to-night and there to-morrow night ; they follow the fish along the coast.

2014. Do you find in the fishing season that every night when you go out to shoot your nets you have the French among you ?—Yes, from the 10th of August to the 10th of September.

2015. Where do you find the fish ?—Often at about a mile from our shore, and the French boats come in there if they are sure of finding the fish.

2016. Does anybody go there to warn them off ?—We have had no protection this year at all.

2017. Has there been any difference in that respect this year as compared with former years ?—Yes. We had two gunboats last year, and the year before we had the Victoria cutter, which did her duty well. Since then we have not had any.

2018. Did you get more herrings then ?—Yes, we were very successful.

2019. Then do you attribute the falling off in quantity to the French fishing boats ?—We had better protection then.

2021. Do you say that your failure this year is owing to your not being protected by the Government against French fishing boats ?—I blame it partly to that. Most of the failure this year has

NORTH SUNDERLAND.

W. Spears.

24 Sept. 1863.

been in consequence of the fish being unable to get in owing to the Frenchmen.

2022. Do you agree with the evidence of the previous witness, that the French fish every day in the week, and that one day you do not fish?—Yes; we fish every day except Sunday.

2023. The French fish on Sunday?—Yes.

2024. Do the French shoot their nets at all times during the day?—Yes. If we were to go out at three o'clock in the afternoon, if they saw us they would shoot their nets at once.

2025. Do you not think it important, to prevent breaking the shoal of fish, that the nets should not be shot before sunset?—Yes, I do.

2026. Do you think it would be of advantage to have a regulation that should prevent fishermen from shooting their nets until after sunset?—Yes.

2028. Is there any other regulation you think would be of advantage?—I consider that we have insufficient protection on our coast as regards the French fishermen. We want five or six gunboats or more; and we want these gunboats, when they come, to do their duty. Those which are here do not do their duty. We never see them; they lie in Berwick harbour. I would make North Sunderland the centre, and require them to do their duty.

2029. From the Tyne to the Tweed?—Yes.

2030. Have you observed the effect of a south-east gale and of a north-east gale in bringing in the fish?—Yes.

2031. Which brings in most fish?—We always get more after a south-east gale than any other.

2032. Is that occasioned by any configuration of the shore, or by the protection given by Fern Islands?—I cannot say. The fishermen consider that if the food comes in from the sea the fish will follow it. We consider that that is the means by which we get more fish after a south-east gale than after a westerly gale.

2033. Then you consider that the food comes principally from the south-east?—Yes; it is a sort of small sile that they come after.

2034. You are not restricted from fishing in any way that you may think profitable to yourself?—No, we have our own liberty.

2036. Do you know anything about trawling?—No. We do not see trawlers here. I think the reason is that our ground is too hard or they would come here. At the same time I think the trawlers have greatly increased in other places. Sometimes I can send fish to the market and get 3*s*., 4*s*., and 5*s*. a stone, but the trawlers send in their fish against them, and I cannot get that price I ought to do for them. I think they do us an injury in that way, although they do not trawl here.

2037. You think the trawlers lower the prices by bringing in a larger supply of fish?—Yes, but their fish is stale fish. Our fresh fish always fetches more money than the trawled fish.

2038. Do you waste any fish by destroying immature fish, or fish not of a proper size?—No; we fish by hooks, and the smaller fish do not take them.

2039. Then you do not practise any mode of fishing that would destroy the fish unnecessarily?—No.

2040. Do you destroy the spawn of fish by the mode of fishing which you practise?—No.

2041. I understood you to say that you do not trawl for soles here?—No, there is not such a thing as a trawl in North Sunderland.

2042. (*Professor Huxley.*) You were speaking of 'sile,' do you mean by that small young fish?—Yes.

2043. Have you any sprats here?—I never saw one to my knowledge.

2044. Do you not think that some of the sile are sprats?—That is a question which I cannot answer.

2045. Do you know the sprat when you see it?—I know the garvie from the sprat and the small herring too.

2046. Do you think they are different things?—Yes, that is my opinion.

2047. What do you think is the difference between the garvie and the sprat?—The difference is in the dorsal fin.

2048. Is the dorsal fin of the garvie further back or forward?—It is further back.

2049. So that if you hold him by the dorsal fin the head will go down?—Yes.

2050. And if you hold the sprat the same way the head will go the other way?—Yes.

2051. Do you not think that the sile are young herring?—That I cannot say.

2052. Is there not some difference in the belly of the garvie and the sprat?—Yes, it is rough.

2053. Which is the rough one?—The garvie I call the rough one.

2054. Then you get the rough-bellied one here?—Yes.

2055. That is what you call the garvie?—Yes.

2056. Well, we call it the sprat. Do you not think the smooth-bellied ones may be young herrings?—That is a question I cannot answer.

2057. What time of the year do you find garvies here?—We never have them here much. We have a young herring here from the beginning of May to our own fishing time.

2058. You do not get the garvies here?—We do not catch the garvies here.

2059. But you do the sprat?—There are no sprats here.

2060. Neither garvies nor sprats?—We do not get them, but we see them frequently from the month of May up to our fishing.

2061. Do you include young herring among the sile?—No.

2062. Do you think that the south-east gales drive the sile in?—Yes, and the fish follow the sile.

2063. What sort of fish is the sile; is it like the garvie?—No, it is a small insect; what we call the 'sile' is a food; it is not a fish.

2064. Is it like a little shrimp?—No, it is like a small insect. It is food or sile.

2065. It is not like a small shrimp?—No.

2066. Has it legs?—No, it is round; it has no legs. We never have them in our hands. I have merely seen them when I have been looking in the water.

2067. How big are they?—They are larger than a pin's end, I think.

2068. Quite a round thing?—Yes.

2069. Do they shine much at night?—No, but when the water is quite smooth you can see them.

2070. Can you see them in the daytime?—Yes.

2071. Did you ever get them out in your hand; are they firm enough to come out?—I have never had them in my hand.

2072. You heard what was said about the mussel park, do you think that a good plan?—I think it would be very beneficial to our place. I quite concur with the other witnesses upon that point.

2073. You heard the question asked about the waste in the line-fishing, in consequence of the dog-fish, and so forth; do you think that the proportion given to us is correct, namely, that they destroy about one seventh of the fish?—I quite concur with the former witness. We have a deal of loss at times.

2074. Have you ever observed that the shooting of the nets before sunset breaks the shoal?—I think it is injurious to the fish, and prevents it from rising. My opinion is that if we did not shoot our nets till near sundown the fish would rise readier towards the nets. The nets darken the water, and keep them from rising. I think it is injurious to the interests of the fishermen generally to shoot their nets before sunset.

2075. Do you think that it breaks the shoal?—Of course, when we shoot too soon at night they rise inside. I think it darkens the water, and when they begin to rise they go off.

2076. You do not think that it disperses the shoal?

—It is a means of dispersing the shoal too. They will not rise among the nets.

2077. Do you think that it breaks the shoal of fish as you would frighten a flock of sheep asunder?—I think it does. Either the outside boats or the inside boats will catch the fish, while there are none at all in the middle.

2078. Then it drives them on each side; it does not disperse them?—Yes, it drives them on one side.

The witness withdrew.

WILLIAM ROBSON called and examined.

2079. (*Mr. Caird.*) Are you a fisherman here?—Yes, I have been so for a long time.

2080. How long?—For 36 years.

2081. You have heard the evidence given by the previous witnesses?—Yes.

2082. Do you agree with them generally as to the diminution in the quantity of fish caught here?—Yes, they have very much diminished in some respects, but I think there are nearly as many herring. Indeed, I think there have been more herring this year than I have ever seen before.

2083. But you are not able to catch as many as you used to do?—No.

2084. What has been the cause of that?—The French, nothing else.

2086. Has that interference taken place within the limit of three miles?—No, about four miles.

2087. Then, is the largest fishing which the French make beyond the limit of three miles?—Yes.

2088. About four miles?—Yes, about four miles, in two and three and twenty fathoms water.

2089. Do you agree with the other witnesses that the French fishermen take about two thirds of all the fish caught here?—I cannot say that. There is a deal caught off our coast.

2090. What proportion do you yourself think they take?—Well, I should say one third.

2091. You think one third will be about the mark?—I think so. There is, however, one thing. Wherever the fish are, there they are. If they don't get them themselves, they prevent us from getting them. The boats follow them.

2092. Then do they do a deal of harm besides catching the fish?—Yes, they encourage the dog-fish.

2093. Do you think the dog-fish frighten the shoals?—Yes, they stop us from getting the herring. I have seen them take 20 barrels of fish out in half an hour. We have got 20 barrels in one haul, and afterwards, in half an hour, on hauling our nets we got none.

2094. Was that out of one net?—No, out of 25.

2095. But it was out of one boat's nets?—Yes.

2096. Then you think they encourage the dog-fish?—Yes.

2097. Do you mean in consequence of their throwing over the guts of the fish; do you regard that as a serious evil?—Yes.

2098. Do you think that if a restriction were put in force prohibiting anybody from throwing over fish-guts into the sea upon the fishing ground it would be of advantage to the fishing interest generally?—Yes, I think it would.

2099. And would it be of advantage to the French fishermen too?—I think if you were to keep them away altogether it would do more good. If we shoot our nets before the Frenchmen, then they come and shoot amongst us. The other night seven or eight of us were fishing off here. We had a good haul, and they immediately came among us. Of course, we had to take our nets up. For my part, I attribute the blame of the bad fishing to the French fishing boats.

2101. Do you concur with the other witnesses as to the less amount of protection which has been given to you during the last year against the Frenchmen compared with previous years?—We have never been protected against them at all this year. I myself have sustained some loss.

2102. What damage did you receive?—I had nine nets in one of the boats destroyed one year—lost altogether—two or three new nets were partly lost and damaged.

2103. Was that by the Frenchmen's nets coming upon yours and destroying them?—Yes.

2104. Was it in consequence of the greater strength of the French nets?—They were not clear of our nets, so they took out a knife and cut us away.

2105. Did you know the French boat that did that?—Yes.

2106. Did you not endeavour to get some recompense from him?—Yes, and here is a letter I got upon the matter. They were within our limits. I did not sound the water. I knew very well what it was. But I had no evidence that they were about two and a half miles off, because we did not swim the water. I think our people will not interfere with the Frenchmen, as far as I can see. I saw the Frenchman heave a piece of our net into his boat. He had cut it off altogether. He did not clear the nets, and therefore he cut them away.

2107. I have read the letter you say you have received, and I find that the commander of the Alert tells you that a proper representation has been sent in to the French ship off this coast of the damage you sustained?—Yes.

2108. Has any further proceeding occurred?—I have heard nothing further yet.

2109. Then you may receive some compensation?—Yes, I may get something.

2110. (*Professor Huxley.*) It has not yet been possible to seize the boat according to this letter?—It appears not. I had a Holy Island pilot on board who said the French were within the limits.

2111. (*Mr. Caird.*) Would sounding the depth of water have told you the limit?—Yes. We told them what the sounding was, but they would not take it. The limit is three miles, and they were within that.

2112. Is the herring-fishing more productive to you than the line-fishing during the whole season?—Yes, I think so.

2114. Then your experience is mostly with regard to the herring-fishing?—Yes, and fishing for lobsters and crabs.

2115. Have lobsters fallen off?—Yes; they are taken in the wrong season. A great many of them are taken.

2116. What do you complain of about that; is there any suggestion you could make that you think would remedy the evil?—The only thing would be to stop them from being taken at such times.

2117. You would have some regulation established to prevent their being fished for in an improper season?—Yes.

2118. What regulations would you propose?—I think none should be taken after May. They are quite in spawn then.

2119. During the month of May?—Yes, and after that too. They take them up to May and June, and then they lose money by them. It is only to accommodate the fishmongers that they do take them.

2120. Do you think it would be of advantage to prevent lobster-fishing from the month of May to the month of December?—They might fish them from December to March.

2121. With regard to crab-fishing, have you any observation to make upon that?—Nothing. But I think we get smaller ones than we used to do.

2123. Would you have some restriction as to the size at which crabs should be taken?—They are small ones that they take. They can tell by the eye that they are not fit for market.

2124. Do you desire to have any legislative restriction passed with regard to yourselves either with respect to one kind of fishing or another?—I think that the lobster-fishing at an improper time should be stopped. I have nothing else to suggest.

NORTH SUNDERLAND.

W. Robson.

24 Sept. 1863.

2125. With regard to the herring or white-fishing, would you like to have any rules established that should bind the whole of the fishermen ?—No.

2126. Do you not think it advisable, for instance, that there should be some regulation with regard to shooting your nets before sunset ?—I think we ought not to shoot our nets until half an hour before sunset.

2127. Do you think it would be injurious to yourselves if you were prevented by law from shooting your nets before sunset ?—I think not; if you say half an hour before sunset, that would not do much harm, and it would be the means of enabling us to get more fish. The herring often fall with the tide before we fish.

2128. (*Professor Huxley.*) What time of the year do they catch berry fish among the lobsters ?—They come in shore about May.

2129. What time of the year do you get them in that state ?—In the beginning of December.

2130. You catch them as berry-fish in December ?—Yes, but in May and June generally. There are some, however, all the year, but not many.

2131. You have some every month ?—Yes.

2132. And when do you get most ?—In May and June. They are almost all berry-fish then.

2133. Let me ask you a question about the dog-fish. Do they not always follow the herring very largely ?—If there are late shoals they do.

2134. Do not the dog-fish hang on the outside of the shoal ?—Yes, if there is a heavy shoal they will. The gutting, however, encourages them a great deal.

2135. But do the dog-fish want any encouragement to follow the herring ?—I think they always follow some kind of fish.

2136. Do you think they ever leave the outskirts of the shoal of herring alone ?—No. In the fore part of the year they are always among them.

2137. Do you think it makes a great deal of difference whether they have the gut thrown overboard or not ?—Yes; I think it is an encouragement to the dog-fish, and I do not think that it is right to do it.

2138. Do the French gut the fish on the fishing ground ?—Yes.

2139. Do they anchor when they do so ?—If it is calm weather they do.

2140. Suppose that a shoal of herring is about here, will the Frenchmen follow them down and gut their fish eight or nine miles off ?—Most of them will gut the fish where they get them. Sometimes they lie a long time on the same spot.

2141. You heard what was said about sile. Do you agree with what was said ?—I used to catch turbot upon the coast, and I have seen this small sile.

2142. What do you call 'sile,' is it the same thing that the last witness meant ?—No. I never saw what he was talking about, but I have seen the sile that fetched the turbot round.

2143. What kind of thing is that ?—It is a long thing, red and soft. We used to find it in the nets. It is rather nice to look at. I never saw the small thing the other witness spoke about. The sile that I speak of would be all over our nets. Whenever it was in the nets you would be sure of catching turbot. But the turbot have diminished so much lately that we have not tried turbot-fishing.

2144. When this sile is swimming, does it work like closing the hand ?—It did not seem to have life in it.

2145. Does it break up into little pieces ?—Yes, into very small pieces; sometimes so small that you could hardly perceive it.

2146. Is there a reddish or brownish dot on the pieces ?—There is a red stream that goes down it. It is transparent. But of course there is always some sort of sile or other that comes in when the fish come in.

2147. Is this sile that you have been talking about on the surface ?—No, at the bottom, but I have seen it nearly at the top also.

2148. Do you agree with what was said about establishing mussel parks ?—Yes. If the one we had had been protected it would have been there now. But it was allowed to be destroyed. So many boats were allowed to take the mussels away that at last they took all away.

2149. Do you think that if it were filled up again there would be plenty for this place ?—Yes, if the proprietors would protect it, and that would be very easy.

2150. Have you ever seen the herring here in January and February ?—No. With regard to the mussel beds, I believe that those to whom the property belong were never asked to protect them.

2151. (*Mr. Caird.*) Has any bed been laid down ?—Yes, at Alnmouth.

2152. How many miles is that south of this ?—15 miles.

2153. Is it long since a mussel bed was laid down there ?—About two years ago.

2154. Has it been successful ?—I believe it has. We had some last year, I know.

2155. Do you think it is as well adapted for a mussel park as the other bed which has been spoken of ?—No, there never was a better place than the one before mentioned.

2156. Do you attribute the falling off to the ploughing-up of the mussel bed in old times ?—I have heard my father talk of its having been ploughed up, but there were plenty of mussels on it in my time. There were acres.

2157. Since it was ploughed up ?—Yes.

2158. Then do you think that the damage was caused by taking too many away ?—Yes, they took all of them bodily away.

2159. (*Professor Huxley.*) Do they throw the little ones into the sea ?—They took all of them away.

2160. (*Mr. Caird.*) If there had been protection to that bed you think it would have been advantageous to you ?—Yes, or if they had picked the mussels there would have been plenty left yet.

2161. And you think it might be restored by careful regulations ?—Yes.

2162. (*Mr. Lefevre.*) Did these mussel beds belong to private individuals ?—Yes.

2163. Did they make you pay for getting mussels from them ?—Yes, we used to pay a penny in our time.

2164. Was that just as an acknowledgment ?—Yes.

2165. (*Professor Huxley.*) You would not object to pay a fair price, would you ?—Well, I don't need any myself.

2166. Do you recollect the price of white fish 20 years ago ?—Yes.

2167. What did the haddock sell for then ?—There are 20 in a score now; there were 25 in a score then, and we found it hard work to get a shilling a score.

2168. What do you get now ?—We get 15*d.* a stone now.

2169. How many stone will go to a score now ?—From 3 to 3½.

2170. So that you now get 5*s.* for a score ?—Yes.

2171. Then 20 years ago you got a shilling for what you now get more than 4*s.* ?—Yes.

2172. Have the other kinds of white-fish improved in price in the same way; do you get the same increase in price in comparison with what you got 20 years ago ?—Yes, about the same.

2173. And how is it with regard to the herring ?—They are down now to a very little price.

2174. Is the price the same as it was 20 years ago ?—No, it is about as much again; 20 years ago I was fishing for 8*s.* a cran. They have risen since the railway was made.

2175. As a general rule, has the price risen since the railway was made ?—Yes.

2176. (*Mr. Caird.*) The railways have improved the price ?—Yes.

2177. (*Professor Huxley.*) Then the railway has done you good ?—Yes.

The witness withdrew.

BENJAMIN MORTON called and examined.

2178. (*Mr. Caird.*) Are you a fisherman here?—No, I am a herring-curer.

2179. Do you purchase a large proportion of the herrings that are caught here?—We buy our share. During the last year we have purchased between 1,100 and 1,200 crans at this place.

2180. How many years have you been engaged in this business?—The firm to which I belong has been engaged in it for about 23 years.

2181. Can you give us any particulars as to the quantities you have bought in any given year during that period?—It has ranged to from 800 up to 1,600 and 1,700 crans.

2182. Has it varied from year to year, or has there been a gradual diminution?—It fluctuates very much. Taking the average of the boats, it has been much less within the last six or seven years than in previous years. Since 1852 there has been a gradual decrease in the average takes of the boats.

2183. Has the total quantity that is cured here been decreasing?—It is difficult to ascertain that. I think it is much about the same. But the fish are divided amongst a greater number of boats. It is much less than the average for each boat.

2184. But you think the total quantity is about the same?—The total quantity caught is, I think, about the same. A good deal goes away fresh.

2185. Then there are fluctuations from year to year, but no decline in the total quantity?—Yes, but it is much less as an average for each boat; and as it is at present, and as it has been for the last two or three years, it is neither paying curer nor catcher.

2186. To what do you attribute that?—We attribute it entirely to the encroachments of the foreign fishermen, and we think that if the treaty between France and England were properly carried out it would afford ample protection for our fishermen, and the trade would thrive as it did in former years.

2187. In what respect do you think the treaty would afford ample protection?—I have the treaty here, and I will point out some of its articles where I think the treaty is openly violated. For instance, take article 30. That article of the treaty says:—"The decked boats on their part shall shoot their "nets to leeward of the undecked boats, unless they "prefer going to windward, to a distance of at least "half a mile, to shoot their nets."

2188. Is that the treaty between France and England?—Yes. I think it is very proper that that article should be enforced, because the decked boats are much heavier and their gear is much stronger. They drive faster than our boats, and if they do not keep that distance off in a very short time they become foul.

2189. Is that not a regulation that applies to decked boats of our own as well as to those of France?—Yes, but there are very few decked boats of ours that fish on this coast.

2190. Is that article not observed by the French fishermen?—No, it is most openly violated.

2191. Is there nobody on the part of the British Government who interferes with the decked boats, in order to protect the undecked boats?—No; I am sorry to say that our Government have been very lax in the protection they have afforded to our fisheries for the last few years, and they send down very unsuitable vessels. We have a large steam corvette here of about 26 guns, and it would be a great expense to keep that ship running among our fisheries. The duty should be distributed among small light-handed gunboats.

2192. (*Professor Huxley.*) I presume that you are now speaking of the Alert?—Yes, she is much too large. What we require is light small-handed gunboats, and we want a sufficient number of them on the coast. In my opinion it would take at least six of them to protect the fisheries between the Tweed and the Tyne. The French fishermen are now getting so daring that they cannot be kept off.

2193. (*Mr Caird.*) What is the length of the coast between the Tweed and the Tyne?—Between 50 and 60 miles.

2194. What is the next article in the treaty which you say is violated?—I will refer you to article 33. That article says:—"If, however, it should "happen that the spot where fishing is going on, and "consequently where the herrings are, should be so "near to the fishery limits of one of the two countries "that the boats of the other country would, by "observing the above-mentioned regulations, be prevented from taking part in the fishery, the said "boats of the other country shall be at liberty to shoot "their nets at a less distance than that prescribed in "the preceding articles for decked and undecked "boats, but such fishermen as may take advantage of "this permission shall be responsible for any damage "or losses which their drifting may cause to the other "boats." Now the damage is always done to our boats, but they cannot get sufficient compensation from the French fishermen for the damage done to their nets.

2195. Is there anything else in the treaty to which you wish to refer?—Yes, article 49; that is an article which has reference to the French fisheries. It applies to oyster beds, but its principle is equally applicable to our fisheries. The article says: "It is forbidden to throw into the sea on oyster fishing "grounds the ballast of boats, or any other thing "whatsoever which might be detrimental to the "oyster fishery." By throwing over the refuse the French make in cleaning their fish, they encourage on the fishing ground immense quantities of dog-fish which prey on the herring and prevent them from coming on the ground.

2196. That, then, is a suggestion for an amendment of the treaty?—Yes.

2197. (*Mr. Lefevre.*) You think that that article should be extended generally, instead of being confined to the oyster beds?—Yes; the principle is very good, and it ought to be adopted generally.

2198. (*Mr. Caird.*) Is there anything else to which you would refer?—Yes, I would refer you to article 52, which says: "It is forbidden to all boats to anchor "between sunset and sunrise on grounds where "herring or mackerel drift-net fishing is going on." Now in calm weather the French fishermen never leave the fishing ground; they have nothing but their sails to depend upon, and they might be prevented from going back to the fishing ground.

2199. Is that clause of the treaty constantly violated?—Yes, they violate it in order that they may get sooner upon the fishing ground.

2200. Is there any other point?—Yes, article 87. That article says: "It is forbidden to herring drift-"net fishing boats to shoot their nets earlier in the "day than half an hour before sunset, except in "places where it is customary to carry on the drift-"net fishing by daylight." Now, whatever time our boats go off, the French fishermen go off earlier, being at sea, and they shoot their nets on the fishing ground in order that they may have what they consider to be the best berth on the ground; the consequence is that our men must take the off side, and they have the chance of getting worse fish, or none at all.

2201. Then do you think it would be of advantage to enforce compliance with that clause of the treaty?—Yes.

2202. Are the French in the habit of violating it?—Yes.

2203. Is there anything else?—I think there is nothing more in the treaty that I wish to call your attention to.

2204. The only suggestion you make is an addition to the clauses of the treaty, namely, that the clause which applies to throwing the refuse on oyster beds should be generally applied to all fishing grounds?—Yes; I may state too that the French have induce-

NORTH SUNDERLAND.

B. Morton.

24 Sept. 1863.

ments to fish on this coast more than any others from the shelter afforded them by Holy Island, the Fern Islands, and Coquet Island, where they are sure of finding safe anchorage.

2205. For these reasons do you think that they congregate more upon this coast than upon the Scotch coast?—I have asked several fishermen and they say that the Northumberland coast is more infested with Frenchmen than any other, and in their opinion the reason why no other part of the coast is so much annoyed as this, is, that they can get such capital shelter among the islands here. In other places they would have no shelter, and would have to remain out at sea exposed to all weather.

2206. In that treaty is there any definition of the line of limit within which the English fishermen are not to fish on the French coast, and within which the French fishermen are not to fish on the English coast?—Yes, three miles.

2207. Is there any place on the French coast that the English fishermen are not allowed to fish upon at all?—No, I think not.

2208. Then the three-mile limit is applicable to both countries?—Yes; one nation has the right to fish up to three miles of the coast of another nation. All the sea outside that is quite open to both countries.

2209. Is there any other remark you wish to make?—No, I think not.

2210. (*Mr. Lefevre.*) Have the French boats increased in number lately?—It has always been the law that they should not buy herrings cured or caught by English fishermen. Since 1852 the French Emperor has rigidly enforced that law, and the result has been that since that year the French fishing vessels have very greatly increased.

2211. Since 1852?—Yes, and year by year they are increasing. Unless something is done in the matter the business will not be worth following, either by the curers or the catchers.

2212. But previous to 1852 they caught fish, did they not?—Yes, but now they are not allowed to buy fish from our fishermen. There is a high duty on the fish caught by the foreign fishermen.

2213. You mean a bounty?—Yes.

2214. I suppose that previous to 1852 instead of fishing off the coast their fishermen bought fish, and went off with it?—Yes.

2215. And since 1852 they have been obliged to fish the ground themselves?—Yes.

2216. Can you tell what number of French boats fish this ground?—I have seen close upon 100 vessels lying under the island and Dunstanborough Castle.

2217. Were these boats collected there in consequence of rough weather, or were they the ordinary boats fishing off the coast?—They were all French fishing boats fishing off the coast.

2218. At what distance?—Wherever the fish were lying.

2219. I suppose they follow the fish?—Yes, wherever the fish are the Frenchmen are always sure to be.

2220. (*Professor Huxley.*) Do you happen to know what is the average distance at which the fishermen fish off this coast; how far do they go commonly to get their herring?—It varies considerably. In the earlier or later part of the year they go nine or 10 miles; in the middle of the season five or six miles to within two miles.

2221. These regulations would seem to apply, strictly speaking, only to the three-mile limit?—Yes.

2222. Outside the three-mile limit, if the French boats shoot first, the English boats that come out are bound to shoot either to windward or leeward of them?—Yes.

2223. Then the enforcement of this Convention would not remedy the evil?—I know it is a delicate matter, but the French vessels do shoot on the weather side of our boats.

2224. But they may do that if they shoot at a distance of half a mile?—Yes, but they often shoot within a much less distance, and our men know perfectly well that they must haul in their nets, because their boats will not drift with the French boats.

2225. I am speaking of the possibility of remedying the evil by enforcing the articles of the Convention?—Yes.

2226. But it does not appear that the articles of the Convention would remedy the evil, because if the Frenchmen shoot their nets first the English fishermen are bound to go outside or inside of them, and not in the middle of them?—Yes.

2227. So that enforcing the conditions of the Convention would not remedy the evil?—No it would not.

2228. To remedy the evil, the Convention itself must be altered?—Yes.

2229. (*Mr. Lefevre.*) Do the French boats make more than one voyage from here?—It is difficult to ascertain that, but I have heard the fishermen say they have known them come back for two cargoes in one season.

2230. But that is not the case generally?—I think not. The French fishermen fishing off here carry from 100 to 140 nets in a boat, equal to two or three of our boats, and the number of French nets fished off the Northumberland coast far outnumber those fished by Englishmen.

2231. What is the proportion of fish caught by the Frenchmen?—I think they catch a far greater proportion than the English, but I cannot state what the proportion is.

2232. We were told at Newbiggin that their nets are not so well adapted for catching the fish as the English fishermen's are?—No, they are not, but still they contrive to get among the fish, and they make very great hauls.

2233. Do you think that the fishermen here are generally acquainted with the regulations and clauses of the Act of Parliament?—Some are acquainted with them, but some are not.

The witness withdrew.

A. Ewing.

ALEXANDER EWING called and examined.

2234. (*Mr. Caird.*) Are you a fish curer here?—No, I am a fish curer at Beadnell, two miles south of this place.

2235. Are there more fish caught there than here?—We have 22 boats belonging to the place, and we catch about 2,000 and a half barrels a season.

2236. Do you mean 2,500?—Yes.

2237. Have you observed in your experience any diminution in the average take of herrings, or does it continue pretty stationary?—There is a great diminution in the catch this year, but it may arise from the fact that there have been more English boats engaged this year than in years gone by.

2238. Has there been any diminution in the total quantity that has been brought ashore?—It has diminished during the last three years, even with the overplus of boats.

2239. Has the diminution been considerable?—Yes, the quantity has been considerably less, and we attribute it to the French invasion of which we have so much reason to complain.

2240. Do you attribute it to the interference of the French fishing-boats?—Yes.

2241. Is there any other cause than that?—I think not. We are not in the habit of getting many spent fish on this coast. From Staples to the Coquet Island I have seen not less than 200 French fishing-boats. The fish could not get in to spawn, and the consequence was that the French boats got all the best fish. The other day 3,000 crans of fish came in, which if it had not been for the French boats would have been caught here.

2242. Do the French cure their own herrings?—Yes, they cure their own herrings, and they put the filth over the side of the vessel.

2243. Is a French boat sufficiently large to enable her to carry the whole of her cargo before she returns home?—Yes, some of them are 80 tons burden, and they carry 400 barrels.

2244. How many years have you been a fish curer at Beadnell?—About 28 years.

2245. Can you give us any figures to show the average catch of herrings during those 28 years?—Yes; in round numbers I have cured 2,500 crans myself at Beadnell.

2246. Are you speaking now of 28 years ago?—I should say that 15 years ago I cured that quantity.

2247. How many would you cure 10 years ago?—From 1,200 to 1,400 crans, but during these three years I have not cured 1,000 crans.

2248. Then it has diminished more than one half?—Yes, it has.

2249. Has the total catch diminished one half?—No, I do not suppose that the total catch has diminished so much.

2250. Is it not the fact that a greater quantity is now sent away fresh?—Yes, I should say that a tithe is sent in that way.

2251. Between the fresh and the cured are there as many caught now as there used to be?—I do not think so.

2252. But that is a matter of opinion, can you give it to us as a matter of fact?—No, not as a matter of fact.

2253. What was the price of a barrel of herrings about 15 years ago?—It would run from 10*s.* to 11*s.* a barrel.

2254. What was the price five years ago?—From 14*s.* to 15*s.*

2255. What was it last year?—17*s.*

2256. Then there has been an increase in the price ever since?—Yes, but I have taken 800 crans six years ago at 5*s.* a cran. This year I have paid as much as 20*s.* a cran.

2257. Then the price has increased during the last 20 years from 5*s.* to 20*s.*?—Yes, that arises in consequence of the fresh fish going by railway.

2258. Do you think that the British fisherman can make as much money in his boat now as he did 18 years ago?—It paid him better when he got 8*s.* or 10*s.* a cran than it does now when he can get 20*s.* It is quite an impossibility for any fisherman to catch fish now or to cure it; in point of fact we are unable to follow the business on account of the French.

2259. Have you any suggestion to offer by which the interference of the French could be modified?—Yes, I think I could make a suggestion; but first perhaps you will tell me whether the convention itself could be altered in any shape.

2260. What alteration would you recommend?—I would recommend that we should have an equal standing with them on our own shores.

2261. But the convention does give that?—It gives that, but the law is so made that they can go through it.

2262. But an alteration in the convention would not improve that, inasmuch as it does at present give equal rights?—There is one thing that I think ought to be done: they are constantly putting their filth where the shoal of herrings lies; the result is that the fish fly from it directly.

2263. Then do you agree with the previous witness that it is advisable to apply to the fishing grounds generally the article in reference to oyster beds?—Yes.

2264. Is there any other suggestion you could make with regard to the convention?—No, I have not studied it sufficiently.

2265. (*Professor Huxley.*) Do you mean that 18*s.* or 20*s.* a cran has been the constant price of late years?—Yes, during the last three years.

2266. What was the average per cran 10 or 15 years ago?—From 10*s.* to 12*s.*

2267. What was it last year?—10*s.*

2268. And the year before?—It would be nearly 11*l.*, perhaps 18*s.*

2269. What was it the year before that?—14*s.* or 15*s.* perhaps.

2270. So that there has been a variation from 12*s.* to 20*s.*?—The price depends very much upon the quantity caught.

2271. Do you take all the herrings at a fixed price during the season?—I take a certain number of barrels.

2272. But before the fishing season commences is any agreement made between the fisherman and the curer?—Very often there is; eight or 10 years ago they were all engagements, but that is not so now in consequence of the railroad taking a great part of the fish.

2273. Then eight or 10 years ago it was customary for the fishermen to agree with the curer at the beginning of the season as to what price should be given per cran?—Yes.

2274. But now the fishermen like to have their own hands free, and they sell the fish in the best market?—Yes.

2275. Then there is no agreement now as to a particular price?—No, a man may get 25 cran a day sometimes, and if he were to engage with the curer it is very likely that the price he would get would be very different from what he would think he should get.

2276. You say that the price has altered in consequence of the construction of the railroad?—Yes; there is one thing which shows the interest taken by the Government in the cure of herrings. My father was a herring curer before me, and he got 4*s.* a barrel bounty. That was knocked off in 1834, but I think the fact that it was paid at all shows that the Government took great interest in the curing of herrings. I should like them to understand that we shall be annihilated altogether as regards our own business if something is not done to improve the fishery.

2277. Would you revive the bounty?—No, we don't want that.

2278. Then why do you refer to it?—I only refer to it to show the interest the Government took in the fisheries. I hope the Government will continue to take an interest in them, and that they will protect the fishery without granting any bounty.

2279. Then the form of interest which you wish the Government to take is simply that of protection?—Yes.

2280. Do you mean by the means of gunboats?—Yes, and otherwise so that they may keep the French boats at a respectable distance.

2281. What do you call a respectable distance? A fisherman told us the other day that 12 miles outside the Dogger Bank was a respectable distance; do you agree with that?—Yes, that would do very well.

2282. Would anything short of that do? What do you mean by a respectable distance?—I want the Frenchman to shoot his net at a distance from the English boats. He ought to keep at a respectable distance from them according to the convention. As it is at present, an Englishman puts his nets down, and the French boats will then come within 100 yards and put their nets down. There is nothing at present to protect the Englishman.

2283. But the French fisherman, if in a decked boat, is bound to keep half a mile outside an English undecked boat; would it be sufficient if the convention were carried out? You say that you think it would be enough if the Frenchmen were obliged to keep a good distance. Now by the existing convention they are required to shoot their nets half a mile outside; if that article of the convention were enforced do you think it would be sufficient?—It would be the means of keeping us in a better state than we are in now.

2284. Would the enforcement of that article be enough?—It allows the three-mile limit to remain as it is.

2285. Exactly; but at present if the English boat

NORTH SUNDERLAND.

A. Ewing.

24 Sept. 1863.

shoots first, the French boat being a heavier boat must not shoot within half a mile either way. Would that meet your view?—Yes.

2286. But there is one other point. If, on the other hand, the Frenchman has shot his net first, then by the existing convention the Englishman shall not go near him?—I see.

2287. That does not quite suit your views, does it?—Not exactly. I went down some time as part of a deputation to the captain of the Alert; he received us very well, and was very courteous to us, but he knew no more about the herring-fishing than a man in the country.

2288. There are two gunboats now, are there not?—Yes.

2289. Do you think that is a sufficient number to protect the fisheries between the Tyne and the Tweed?—No; it would take three times to do it properly.

2290. Do the present boats do anything to protect the fisheries?—I cannot answer that. I am not a fisherman; but a friend of mine wrote to Mr. Primrose, and we made a complaint to the captain of the Alert about not having sufficient protection. Mr. Primrose wrote a letter stating that he had written to Holy Island desiring that protection should be sent.

2291. (*Mr. Caird.*) In answer to your friend Mr. Primrose said he had written to the captain of the Alert?—He sent a boat with 12 oars, and said he could not command a gunboat.

2292. Then what was the advantage; did the boat with 12 men do any good to you?—No; it was a piece of mockery.

2293. Did the boat go out?—Yes.

2294. (*Professor Huxley.*) Did she do any good by lying in here?—They went away next day; they only laid here one night.

2295. (*Mr. Lefevre.*) Do you think that the Frenchmen ought to be prohibited from throwing their offal overboard?—Yes, I think that is very essential.

2296. Under the present regulations they are not allowed to come on shore and carry their fish on shore?—No, not on shore. But when he hauls in his net he could go to some place where the herring fishery is not being carried on. A herring will fly from a herring net, let alone the gut of a herring.

2297. Would it be sufficient to prohibit the Frenchmen from throwing the offal overboard in any part of the sea where the herring-fishing is going on?—Yes; the same as we do with the refuse from our farmyards. We take it to the dunghill.

2298. Do you take the offal on shore?—Yes; it is a very desirable thing for the farmers to get.

2299. Would you allow the Frenchman to do that?—I don't know.

2300. Do you think that they should have leave to bring their herrings on shore and cure them there?—They might do so if they liked. They would not injure the carriers by doing so.

2301. Do you send all the herrings you cure by train?—No; I loaded a vessel for Newcastle on Monday, and I sent another to Glasgow.

2302. Is a considerable quantity of the herring sent by sea now?—No, it mostly goes by train.

2303. Is it the same for this place as Beadnell?—Yes.

The witness withdrew.

J. Archbold.

JOSEPH ARCHBOLD called and examined.

2304. (*Mr. Caird.*) What is the name of the place at which you are a fisherman?—Craster.

2305. Are there many fishing boats there?—There are 33 herring boats.

2306. Are there many boats engaged in the line-fishing?—There are 17 in the winter time.

2307. Have you been long engaged as a fisherman there yourself?—Yes, for 28 years.

2308. Have you noticed any diminution in the quantity of fish caught there during those 28 years?—Yes, in the haddock fishery there has been a great decrease.

2309. Are there more boats now than there were 28 years ago?—Yes, seven or eight more.

2310. Has the falling off in the quantity of fish caught during the 28 years of which you speak not been compensated by the additional number of boats?—Not by a long way since I first went to sea.

2311. What do you suppose would be the total falling off in the fishery for each boat?—There are not one third caught now to what there used to be, according to the lines thrown in.

2312. Not one third?—No, I think not since I went to sea.

2313. But more boats are employed?—Yes.

2314. You think the additional number don't make up the total quantity to what it was 28 years since?—I think not.

2315. What kind of fish has diminished most?—Haddocks.

2316. Have they diminished in size as well as in quantity?—Yes, in both I think.

2317. Have you noticed that very perceptibly?—Yes.

2318. Is that the common opinion of your people?—Yes.

2319. Are the cod as good as they used to be?—They are as good, but they are very scarce.

2320. Are they as large now?—We have got good ones, but not so large as they ought to be.

2321. Has that arisen from the closer fishing in consequence of there being more boats?—It may have arisen from that.

2322. Is there any trawling carried on near your place?—No, but it has got pretty near hand. It is now as far as Coquet Island.

2323. Has any injury been done to the deep-sea fishery by the trawlers?—I cannot say.

2324. With regard to the herring fishery, has that fallen off?—It is more divided among the boats.

2325. Do as many herrings come now as there did formerly?—I believe so.

2326. Do many herrings come in now?—Yes, many herrings come in which we should get if it were not for the French fishermen.

2327. Do you agree with the other witnesses on that point?—I agree that the French boats are a nuisance to us.

2328. Do they take the fish within the three-mile limit?—Yes; I have seen them within one mile.

2329. Do they take most of the fish they get within the three-mile limit?—Not for these few years past. The fish lie a little further out.

2330. Then they have not exceeded their limits within the last few years?—No; last year they did more than this year and the year before too.

2331. (*Professor Huxley.*) Was it at your place that the mussel bed had been set up?—There is none at our place. There used to be a supply at Holy Island, and when that fell off we went to Stockton with our boats, while small vessels came here from Boston.

2332. Do you know of any place where an artificial mussel bed has been made?—Yes, at Alnmouth, seven miles from our place.

2333. How many years is it since that was set up?—It is two years gone; this is the third year.

2334. Were mussels put there?—Yes, and the fresh-water runs down.

2335. Does the river run down over the mussel-bed?—Yes; the bed was laid down on each side of the water.

2336. Are the mussels washed by the fresh-water?—Yes; the two waters meet and cover them at high water.

2337. What is it at low water?—At low water all the fresh-water runs down.

2338. Is that a suitable place to put a mussel bed?—Scarcely, and it has not succeeded.

NORTH SUNDERLAND.

J. Archbold.

24 Sept. 1863.

2339. There is no water at all when the tide is back ?—No.

2340. Do you mean to say that at the ebb tide the water runs down and has made a channel between the two beds ?—Yes.

2341. Then even at the best of times, at high water, they only get a mixture of brackish water ?—Yes.

2342. Did you ever see mussels growing well in brackish water ?—No, they are all in salt water.

2343. Who laid the bed down there ?—The Duke of Northumberland. He put oysters down also.

2344. How are the mussels doing there ?—They are doing nothing at all.

2345. Are they wasting away ?—Yes.

2346. How are the oysters ?—The duke has been at a great deal of expense with them, but they do not succeed.

2347. Has there been any other bed made ?—Do you mean an artificial bed ?

2348. Yes.—I don't think there has.

2349. Is there any fresh-water on the mussel bed at Holy Island ?—No.

2350. Have you ever seen a good mussel bed where it has been washed by brackish water ?—No, nothing particular.

2351. Nor have I.—I don't think they do well there.

2352. (*Mr. Caird.*) Then you think the other bed is much more favourable for breeding mussels ?—There were no such mussels as there were once on the coast of Northumberland.

2353. You think they would succeed if they were taken care of ?—If they were taken care of all the fisheries would be supplied with bait.

2354. (*Professor Huxley.*) But you do not think it wonderful that they did not answer when the water was brackish ?—No.

2355. You have heard what has been said by the previous witnesses. Has there been the same rise in the price of fish in your neighbourhood during the last 20 years ?—There has been very little difference, I think.

2356. (*Mr. Lefevre.*) How far is Craster from here ?—Nearly 10 miles.

2357. Is it north or south ?—South.

2358. How do you sell your fish ?—All by the stone.

2359. Do the curers come and buy them ?—We send the fresh fish—the white fish, away ourselves.

2360. How do you send them, by rail ?—Yes.

2361. Does all the fish go by rail ?—Mostly, except a few that we cart.

2362. What proportion of your fish goes by rail ?—Sometimes we send from three to four tons in a day.

2363. What proportion of the whole quantity you catch goes by rail ; is it one fourth, one half, or two thirds ?—I should say about three fourths. With regard to the salmon trout fishery, I think the fishermen have little privilege in reference to that since the new Act came into force.

2364. (*Mr. Caird.*) Has it injured the fishermen ?—Yes, I think it has done them a great deal of harm.

2365. In what way ?—We used to start in the month of June, and fish until October and sometimes December.

2366. With what kind of nets ?—They were just a circle ; and now we are not allowed to fish longer than the 2d of September.

2367. By that means you have been deprived of the power of catching fish ?—Yes ; that is the only time the fish come on the seashore.

2368. Were they in good condition then ?—Yes.

2369. (*Professor Huxley.*) If you catch a salmon in the net do you put him out ?—No.

2370. Do you sometimes catch salmon not in condition ?—I have fished for a long time, and I do not think I ever caught more than two real salmon in my life.

2371. (*Mr. Caird.*) Did you formerly catch a large quantity of salmon trout ?—Yes, sometimes a good many.

2372. Then has the operation of the Act occasioned considerable loss to the fishermen here ?—Yes.

2373. What proportion in value would that salmon trout fishing be to the other fishing on your shore ?—We fish for them all the latter part of September, during the month of October, and even in November. I have seen the boats go out and get pretty good shots of them.

2374. How much money do you make by it in the season ?—We never depended entirely upon it.

2375. Cannot you give us a figure ?—Sometimes a boat would get as much as 2*l.* for their share when they came on shore.

2376. And how much for the fish caught during the season ?—It would all depend on the weather. If the sea was not smooth we should not get many.

2377. Cannot you give us some idea in figures ?—No, there is no use making a talk about it.

2378. (*Professor Huxley.*) Did you fish 10 nights ?—Yes, more than that.

2379. Twenty nights ?—More than that.

2380. Thirty nights ?—I should think so.

2381. (*Mr. Caird.*) Do you make as much from the salmon trout fishery as from the herring fishery ?—No.

2382. Did you make one fourth ?—No ; at another place on the coast they depend far more on salmon-trout fishing than on the herring.

2383. What would be the average weight of the salmon trout you catch ?—I have caught a salmon trout very heavy, 25 lbs.

2384. But what would be the average weight ?—About 5 lbs.

The witness withdrew.

ROBERT FAWCUS called and examined.

R. Fawcus.

2385. (*Mr. Caird.*) Where are you a fisherman ?—At Beadnell.

2386. Are there many boats there ?—There are 20 keel-boats there—herring boats.

2387. How many are there employed in the line fishing ?—I think there are five.

2388. Have you heard the evidence given by the other witnesses to-day ?—No, I have not been long in the room, but I have heard part of it.

2389. How many years have you been engaged in fishing ?—20 years.

2390. Has the herring fishery fallen off, or does it continue as it was upon the average ?—It has fallen off a great deal.

2391. Are there not as many herrings now as there used to be ?—The shoals would be plentiful if it were not for the French fishing boats.

2392. What interferes with you in your fishing ?—We cannot get our nets shot now. I could get 100*l.* more a year if I could get my nets shot.

2393. What prevents you from shooting your nets ?—The French boats come so close in—they are very thick upon us.

2394. Do they come within the three-mile limit ?—Sometimes they do, and sometimes they do not.

2395. Have you ever had any dispute with them ?—Once I did. At last I got clear of the vessel and one of the Frenchmen took this piece of wood (*holding it up*) and laid it over my head.

2396. Were you saying anything to him ?—No, I was quite quiet. They had one of my nets and another man's twined together like a warp.

2397. How did they get hold of them ?—There were five of them that drove our two boats.

2398. Were they within the three-mile limit ?—

NORTH SUNDERLAND.

R. Fawcus.

24 Sept. 1863.

They would be about three miles off. They were in 18 fathoms of water. That would be just about three miles off; but I think they were within the limit a little.

2399. (*Professor Huxley.*) Were you to windward of them?—No, to leeward.

2400. Did they throw that piece of wood at your head because you did not get out of the way?—Yes; they drifted down upon us. At another time, off Holy Island, we shot our nets, when they shot close to us, and we had to haul our nets in directly

2401. Was that because you were afraid of having your nets destroyed?—Yes, and the gunboat was lying at the time in the harbour, but it never sent a boat off, and yet the French vessel was only two miles off.

2402. Do you think the French fishermen take more herrings than are caught by the English fishermen?—Yes, that is my opinion.

2403. Do you think that they do any harm to the shoals of herrings by any practice they adopt other than by their mode of fishing?—Yes, by letting go their anchor and gutting their fish.

2404. What harm does that do?—Why, if you let anything go among the herrings the herrings will fly from it. I have seen them fly. On summer nights I have gone on the top of the boat's gunwale and I have seen them fly away down.

The witness withdrew.

(*Mr. Caird.*) Is there any other fisherman here who desires to add anything to what has been stated by the witnesses? If there is we should be glad to hear him if he desires to offer any suggestion or make any complaint. Has anything been omitted that you would like to have supplied?

There was no response, and the inquiry was then adjourned to Friday, September 25, at Holy Island.

Holy Island, Northumberland, Friday, 25th September 1863.

HOLY ISLAND.

J. Smith.

25 Sept. 1863.

PRESENT:

JAMES CAIRD, Esq., M.P. (Chairman). | Professor HUXLEY, F.R.S.

JOHN SMITH called and examined.

2405. (*Mr. Caird.*) Are you a fisherman here?—Yes.

2406. Have you been long engaged in the fishing off this coast?—I have been engaged in the fishing here going on for 40 years.

2407. Do you practise all the different kinds of fishing that are practised along this shore?—Mostly, but we do not follow the turbot-fishing. We follow the halibut, cod, ling, lobster, skate, and haddock-fishing.

2408. Do you also follow the herring-fishing?—Yes; we go fishing for herring during the herring season.

2409. Is your herring-fishing the most valuable source of your fishing?—Yes, we get most by that while it lasts.

2410. In the course of the 40 years during which you have been engaged in fishing off this coast, have you observed any marked change in the supply of fish caught here?—Yes, there has been a very great deal of change especially within the last 20 years.

2411. Has there been about the same number of fishermen and boats employed during the last 20 years?—I think they have increased a little, but not a great deal.

2412. How many were there 20 years ago?—They would be well up for 60, I should think.

2413. Do you mean that 20 years ago you had 60 boats?—No, not boats, I mean 60 fishermen.

2414. And how many boats would you have 20 years ago?—In the white-fishing we should have about 16 engaged.

2415. And how many in the herring-fishing?—About 12.

2416. Twelve only in the herring-fishing?—Yes, only 12.

2417. How many have you now? In the first place tell me how many boats you have now engaged in the white-fishing?—I think we have 17 now.

2418. And how many in the herring-fishing?—I believe that we had 37 at the herring-fishing this year.

2419. Are they manned by the same number of men now that they were manned by 20 years ago?—No, there are more men now in some of them. In former years they used all of them to have four hands.

2420. What number of men is in each boat now?—Some of them have five, some have four, and some only three. I belive that two small boats went to the fishing this year with only three hands.

2421. Are the boats that you employ about the same size now that they were 20 years ago?—No, they are not the same size now.

2422. Are they smaller or larger?—They are a great deal larger now than they used to be.

2423. Do they carry longer lines and a greater number of nets?—Yes, they carry more nets now than they carried 20 years ago, and a greater length of lines.

2424. When did you distinctly observe the falling off in the quantity of fish caught here? About what time? Was it 20 years ago, or 10 years, or still more recently?—I should think it would be about 14 or 15 years ago.

2425. And has the quantity of fish caught been regularly declining ever since that period?—Yes, it has been regularly declining since then. We catch a much less number of fish now than we did 14 or 15 years ago.

2426. Have you had, within the period to which you refer, any exceptional years in which there was good fishing?—We may have had an exceptional year with regard to the herring-fishing. Sometimes we have had a good year and sometimes a very bad one.

2427. I am not speaking of the herring-fishing now. I wish to know if there have been exceptional years in regard to the white-fishing?—No; there has been very little difference. It has been always on the decrease.

2428. Have you noticed if that applies to the size of the fish as well as to the quantity?—Some years they run larger and some years they are smaller. In some years we have caught haddock very small, and in others they have been much larger.

2429. Upon the whole, have you observed that the haddocks run smaller now on the average than they did 12 or 15 years ago?—Yes, they are a great deal smaller.

2430. And as to the cod-fish, is there the same difference or not?—There is not the tenth part there used to be.

2431. You mean in quantity?—Yes, in quantity.

2432. And are they smaller in size?—They are not so large now as they were formerly. We occasionally get nearly as large fish in some seasons, but in a general way they were far larger formerly than they are now.

2433. At any time within your experience were turbot caught here?—Sometimes we have caught

turbot. Occasionally there may be one on the hook, but we have never fished expressly for them.

2434. You have never had a fishery for turbot here?—No, not with nets in my day, but we have got one or two occasionally by chance.

2435. Have you ever fished for soles here?—Not in my day.

2436. They do not practise trawling for soles here?—No, not upon the island.

2437. Do you get any salmon trout here?—No.

2438. Are there no salmon trout here?—Very few. Some persons, generally people who can do without fishing, will put in nets as a pastime, but I believe there are not many caught.

2439. It is not made an object of the fishing here?—No; there is a fishery out off the coast, but it is let at Berwick-on-Tweed; a company has taken the shares.

2440. With regard to the price of the fish, has there been a great increase in the price within the last 10 or 12 years?—Yes, there has.

2441. Can you tell me what you would get for a boat's fishing 12 or 14 years ago?—That would depend upon how they were sold. They would not be sold by weight, but by the score. Full-sized haddock used to sell for 1*s.* per score. When they ran small they used to be sold for 6*d.* and 8*d.* a score.

2442. What would you get for a score of the same kind of haddocks now?—They are all sold by weight now.

2443. How much would a score weigh now?—I can hardly say, to take them in a general way. It depends so much upon the size of the fish. In some parts of the ground we fish, some will run four stone to the score occasionally, and taking it upon the average, I think they will run about two stone to the score.

2444. Two stone to the score?—Yes, about that.

2445. What do you get per stone?—In the summer time we get 1*s.* 3*d.* per stone.

2446. That would be about 2*s.* 6*d.* for a score now-a-days, as against 1*s.* for a score 12 years ago?—Yes.

2447. With regard to the herring fishery, do you find that it has fallen off very much?—Yes, a very great deal.

2448. Do as many herrings come off the coast as used to come?—They are a long way short this year, and last year too.

2449. Do you think that the herring are not there now?—That is my opinion. I do not think they are there; for a good few years back they have been on the decrease.

2450. Do you think that the shoals are smaller, or that there are not so many of them?—I do not know; we have the French lying off the coast, and whether they pick them up, or no, I cannot say. I know that the French fishing boats are not allowed to come within the three-mile limit, but we have been very badly protected. The French boats lie out fishing all along the Northumberland coast, and as far as Berwick, and the consequence is that not near as much fish comes in as there used to do.

2451. Do the French fishing boats come within the three-mile limit here?—Yes, we cannot keep them off, and the gun boats which ought to protect us never try to keep them off. The French fishermen's nets are not half as deep as ours. I do not think that they will draw above three or three and a half fathoms of water, or at any rate four; and many times we cannot put our nets out, the herring are that near the shore.

2452. Your nets, I presume, would go to the bottom?—Yes, and we should lose the whole of them. We are unprotected altogether here.

2453. Is it of advantage that the nets should be as deep as you have them?—It is an advantage in some cases, because in deep water the deeper the net the more fish we get. But the French fishing boats have a greater length of nets; what they want in depth they have in length.

2454. Do you think they get more fish than you with the extra depth?—I cannot answer that question.

2455. But if they possess any advantage over you in reference to the size of their nets, it is an advantage which it is in your own power to alter if you like?—Perhaps so; but in some cases it depends upon how the shoal of fish are followed.

2456. I understand you to say that the French fishermen interfere with your fishing within the three-mile limit; is that interference greater now than it was a few years ago?—A few years back they never came here at all. It will be 20 years or a little more since they first came. But I know now that they have just taken the coast from us, and have spoilt and ruined our fishing, while we remain unprotected, to a great extent.

2457. Have you ever found, since the French fishing boats came off here, that the Frenchmen shoot their nets before sunset?—They are lying upon the ground wherever the fish are, and wherever they can let go their anchor they do so and they lie among the fish. When they take the nets in they throw the fish upon deck and commence gutting them. Perhaps there will be 100 ships engaged in this way at a time, all of them taking the gut out and throwing the offal overboard into the sea among the body of the fish. I consider that that does a great deal of injury to the fishing. It spoils the whole of the fish and they fly away.

2458. Have you any prescribed time at which you are to shoot your herring nets?—We never shoot them before sunset.

2459. Half an hour before sunset?—Sometimes it may be a little before that.

2460. Do you think it would be of advantage to the fishermen and likely to increase the catch of herring, that regulations should be made for the purpose of preventing anybody from shooting nets till within half an hour of sunset?—I do not think it would.

2461. You think it would be of no advantage?—Whenever they are lying on the fishing ground in fine weather they can see our boats leave the shore, and directly they see us go out they shoot their nets and the consequence is that when we get there we cannot get our nets in at all. We have therefore to rush off sooner than we should otherwise do for the purpose of taking a berth.

2462. But the rule is, that neither you nor the French shall shoot your nets until half an hour before sunset. Do you think if that rule were properly carried out that it would be of advantage to the fishing generally?—No. It is very little the nets will take before it begins to get dusk.

2463. Do you not think that it would be of advantage to the general fishing that neither you nor the Frenchmen should be allowed to shoot your nets until that time, namely, half an hour before sunset?—We should have a chance then of getting our boats in and getting a berth.

2464. Do you not think that that is a matter of some consequence?—It may be.

2465. Are there any days during which you are prohibited from shooting your nets at all. Is it usual for you to refrain entirely from shooting your nets on Sunday?—Yes. On that day there is no market for the fish, or I do not know what might be done. For my own part I do not go out on the Saturday night, nor on the Sunday night.

2466. I presume that none of our fishermen go out then?—Yes, some of them go out on the Sunday night, but none on the Saturday night.

2467. Do the French fishermen abstain from shooting their nets on Sunday?—No, they shoot them both on Saturday night and Sunday night.

2468. But you do abstain during one night in the week?—Yes, always for one day and night. There is always one night when we do not shoot our nets. But the Frenchmen fish all the week round and never cease. They never lose either Saturday or Sunday, and I consider that that is a great injury to the fish,

HOLY ISLAND.

J. Smith.

25 Sept. 1863.

because, if there were no fishing during one day in the week, the fish might have an opportunity of getting together again and uniting in a body after the week's fishing. The nets of the Frenchmen lying continuously among them break up the body of fish, and they have no chance of getting together again, which is very much to our disadvantage.

2469. Do you know what the quantity of herring caught here this year will amount to altogether?—No, I do not.

2470. Are there any means by which we can ascertain that?—The merchants' books would tell.

2471. Have you any trawling off this shore?—No, there is no trawling.

2472. Do no deep-sea trawlers come up this length?—I believe that one came off Berwick bank last year; at any rate the papers stated so. He dredged for about an hour and a half, and it was stated that he took 5 tons of fish, which he sold at Granton Pier.

2473. Was that last year?—Yes.

2474. And there have been no trawlers off your shore?—Not that we have seen.

2475. They do not practise trawling off this coast?—No.

2476. Can you attribute to any cause whatever the falling off in your take of white fish?—In my opinion after the fish leave our common ground, where we fish here both winter and summer, I think they go to Berwick banks. Boats go out there and catch them at the time they are spawning, and they catch a good many both old and young, when they are of no use to anybody. That, in my opinion, is the principal cause of the falling off in the take of white fish; but other people may have other opinions. I think also that they are caught in the breeding season, when they ought not to be caught.

2477. Who is it that catches them in the breeding season?—The boats from Scotland, from Eyemouth, Burnmouth, and a place they call Colgin.

2478. But they are not trawl-boats?—No, the fishermen catch them with the long line, but we attribute to that the decrease of haddock.

2479. When are they caught?—They catch them in February and April.

2480. I gather from the remarks you have made that you do not think it right to catch them in those months?—No, I do not.

2481. Do you not fish in those months?—No; we put in our creels and catch crabs and lobsters.

2482. During the months of February and March?—Yes.

2483. You abstain from fishing for white fish during those months?—No, we catch them for bait to put in our lobster creels, but we cannot get many of them because the haddock leaves our common ground and goes 30 or 40 miles off these banks to spawn. At that season I do not think we should get a score a boat apiece.

2484. And at that time do the boats come from Scotland and fish the outside banks?—Yes, at the time they are spawning; they take all the breeding fish and also those which are beginning to quicken. They pick up all kinds.

2485. That is the cause of the decrease of the haddocks on your ground, you think?—Yes, in my opinion.

2486. (*Professor Huxley.*) What is the depth of your herring nets here? How many fathoms?—About eight fathoms.

2487. That is very deep, is it not?—Yes.

2488. I am speaking of the net without the headlines?—There is a difference in the end of the nets. In putting the nets in I generally set mine on the end about five and a half fathoms; the net stretches from the mesh. We take the strain off the net and at the middle of the net it will draw a fathom or two more.

2489. About eight fathoms?—I think so in the middle.

2490. What is the size of your mesh?—We have different sizes, 30, 31 and 32 to the yard, when they are first made up, but we tan them, and they will then run into 33 34, and 35 to the yard.

2491. Do you never have them more than 36?—No, that would be against the Act of Parliament.

2492. You know, then, that the size is regulated by the Act of Parliament?—Yes.

2493. Is there any law to prevent you casting your nets before half an hour previous to sunset?—No. I never heard of that.

2494. Have you heard of any law requiring you to have a certain coloured vane at your mast-heads?—No.

2495. Or of any law requiring you to keep outside the decked French fishing boats if they cast first?—No.

2496. Do you know that there is a law requiring the French fishermen to keep outside if you shall have shot your nets first?—I have heard that there was such a law, but it has never been put in force. I have heard it said that the French boats ought to keep at a certain distance from us, but it has never been put into execution.

2497. But have you ever heard that there was a law which required the French boats to keep outside of your nets if you had shot them first?—No.

2498. Do the gunboats here exercise any supervision in the fisheries between you and the French fishermen?—Very little indeed; I believe there have been two at Berwick, and once or twice at the most I have seen them.

2499. You spoke just now of desiring better protection from the French?—Yes.

2500. What kind of protection would you wish to have?—I think that a gunboat at every fishing place would afford the best protection.

2501. What would they do?—They would be able to go out very frequently and keep the French within their limits.

2502. You mean without the three-mile limit?—Yes. Is there any law to keep them further out?

2503. No. They have no business to come nearer to the coast than three miles, and they are not allowed to fish on Sunday. If that law were enforced, would it be sufficient for you?—For my part, I think the limit is not far enough.

2504. What is the usual distance at which you fish for herring from the shore?—I cannot say.

2505. On a rough average, can you say whether the fish you want to catch are commonly inside the three-mile limit or beyond it?—We get far more fish without the three-mile limit than we do within it.

2506. So that, in fact, the great majority of the fish are outside the three-mile limit?—Yes.

2507. The French always keep the sea, do they not?—No, they come into the harbour.

2508. But generally they keep the sea?—Yes, they generally keep the sea, and in fine fishing weather they let go their anchor and there they lie.

2509. Have you ever heard of a law which makes it illegal to cast anchor on the fishing ground when fishing is going on?—No.

2510. Is there anyone here who can give you instructions as to the law relating to the fisheries?—No.

2511. Is there any fishery officer here?—No. There is one stationed at Eyemouth, I believe, and he comes up the coast.

2512. Does he come here?—He was here the other day.

2513. What was he doing here?—He was up looking at the herrings.

2514. Looking after the herring fishery?—Yes.

2515. Do you mean that he was here in order to ascertain the quantity?—I do not know; I suppose he was seeing what quantity there was. He was examining the fish—seeing what was cured and what wanted the Crown brand.

2516. Do the curers get the Crown brand?—Yes; if their fish will pass.

2517. Did the fishery officer ever come to see if the mesh was of the right size?—Sometimes he has done so at North Sunderland.

2518. Did you ever hear of a man having been fined because the mesh he used was too small?—No. A shilling is about the gauge we measure the mesh with. I have never seen one smaller.

2519. You were speaking of offal being thrown overboard and doing harm to the fishing grounds; why do you think that does harm?—Because I think it lies there and gathers other things about it which feed upon it. If there is any spawn there they will feed upon that; I believe also that the offal thrown over poisons the ground.

2520. Do you think that the fish will not lie where it is?—No, I do not.

2521. But is it not against the French fishermen's interest to do that?—Yes; but they do not care for that if they can get a good catch of fish.

2522. Can you form any judgment as to the quantity of fish the French fishing boats catch? Do they catch more than you off your shore?—I cannot answer that question; but I know that they fling the gut and other things into the sea. I know also that in some cases when they have been fishing upon our ground so many have got into their nets that they could not get them out. For years there have been no others in the place.

2523. What amount of protection from the gunboats do you think would be sufficient to protect your interests?—I think there ought to be a gunboat at Berwick and another on the Northumberland coast.

2524. You do not think that the three-mile limit is enough?—No.

2525. How far would you like it to be?—We would like them to be off the coast altogether. We don't like their company at all. If I had my way I would keep them at home.

2526. But suppose the Yarmouth men come here and fish with their heavy boats, what would you do with them?—Why, we must make the best of them we can. There is no law to protect us against them.

2527. Then you do not object to your own countrymen coming and cutting you out?—I like my own countrymen better than the Frenchmen; but if their gear and their boats were the same as ours (I mean our own countrymen) it would be much better. As it is, I think a great deal of injury would be done by the Yarmouth men and their boats. It would be just the same as the French luggers with us. Our nets would never be able to hold their own against theirs.

2528. They would cut you out in just the same way as the French?—We should not be much better off.

2529. Do you propose that any law should be passed to keep them off the coast?—No; that would be very selfish.

2530. Have you ever been engaged in long-line fishing?—Yes.

2531. Do you lose much of your fish by the dog-fish?—Sometimes we do.

2532. What proportion of your fish do you commonly lose by dog-fish?—I cannot give you an idea. Sometimes they eat them very much, but we have not been much disturbed by them for some years past.

2533. Are suckers common here?—I do not know them by that name.

2534. Do you know them as 'hags'?—There have been a great many things following the herring.

2535. I mean a fish, round, like a worm and with no eyes?—That is what we call the 'rapper eel.' They will go into the fish and suck every bit out, leaving nothing but the skin.

2536. What do you call it?—The 'rapper eel'; but what the proper name is I cannot say.

2537. Are they common here?—Yes; there are thousands of them.

2538. Do they destroy your long-line fishing much?—Yes, occasionally. I have known them go into a halibut and leave nothing but the skin.

2539. How many will you find in a halibut when it has been cleaned out?—I hardly know; I have seen a codfish packed tight with them.

2540. They are so abundant as that?—Yes, we have thousands of them.

2541. Is that every winter?—No, principally in summer, but we have a good many of them in the winter.

2542. Have you any here now?—Yes.

2543. Have you caught any here lately?—When we take the long lines out we are rid of them.

2544. I suppose you destroy them when they come on board your boat?—There is no doubt of that.

2545. Do you think the quantity of fish taken—the total quantity—has fallen off? You know that your boats have increased in number. What I want to know is, whether the fishermen, in consequence of the increase in the number of boats, do not earn as much money now as they used to do?—I do not think they do.

2546. (*Mr. Caird.*) Do the French fishing-boats fish within the three-mile limit on Sundays?—Yes, at all times, Saturday and Sunday too, close on to the very shore.

2547. Is the lobster-fishing here good?—No.

2548. Is it declining?—Yes, a great deal.

2549. What do you think is the cause of that?—I think they have been over caught.

2550. Fished too close?—Yes.

2551. Does the crab-fishing continue good?—No, there have not been so many this last year.

2552. Was it pretty good before?—We had them very good some years past, but there have not been many caught during the last few years.

2553. Has there been the same decline in the crab-fishing that you have noticed in the lobsters?—No.

2554. How are you supplied with bait here?—Pretty well.

2555. Where do you get it?—We hook the worm in the summer time.

2556. Do you use the worm chiefly for bait?—Yes, and limpets. The Earl of Tankerville has an oyster scarp and a mussel bed, and we have the privilege of bringing them off. There is some slack there, and we lay them on the Earl of Tankerville's bed.

2557. And there they breed?—Yes.

2558. And you generally get your bait there?—Yes.

2559. You have no need to import bait then?—Yes, we have bought it occasionally. We have had two or three shiploads when the boats have come down.

2560. Then what with what you can obtain yourselves, and what you can import, you have plenty of bait?—We have no cause for complaint on that head at all. We have been in the habit of getting limpets from the rocks, but they are going to try and prevent us from taking them.

2561. Is there any restriction enforced that operates injuriously against your fishing?—I do not know. I don't think there is.

2562. Nobody does interfere with you in any way except the Frenchmen when they come upon your fishing grounds?—No.

2563. No English official interrupts you or interferes with you, or regulates your fishing or mode of fishing?—No.

2564. No fishery officer comes to you?—No.

The witness withdrew.

JAMES MORTON called and examined.

2565. (*Mr. Caird.*) Have you long been a fisherman here?—I have been 44 years a fisherman here.

2566. Do you agree with the last witness that the supply of fish obtained off the coast here is decreasing?—Yes.

2567. In what kind of fish have you principally

HOLY ISLAND.

J. Morton.

25 Sept. 1863.

observed that decrease?—In cod, haddock, and turbot. All kinds of fish are less now than they were when I started fishing.

2568. Are there many turbots now?—We have no nets for turbot, but I suppose the halibut is a kind of turbot.

2569. Has the size of the fish decreased in your opinion as well as the quantity of fish caught?—Yes, a good deal. They are not "nigh hand" the size they used to be in former times.

2570. Is it very marked?—Yes; we used to get very large fish. No place got larger.

2571. Can you tell us the difference in the average weight of the fish now compared with what it was 20 years ago? Take a cod, for instance; what was the average weight of a cod brought ashore 20 years ago?—I never saw any of them weighed, and I cannot say.

2572. Can you give me any idea of the difference in the size of the haddock?—Yes, I have had some which would weigh 6 or 7 lbs.

2573. Twenty years ago what would be the average weight?—About 20 or 30 years ago they would weigh 6 or 7 lbs.

2574. What is the average weight now?—They are not "nigh hand" that weight. They are not half that weight. There might be some particular one which might weigh pretty well, but not the general run of them. I have seen one haddock weigh 9 lbs., but that was a very exceptional case.

2575. Do any mackerel come off this shore?—We catch some among the herring during the herring season.

2576. But you do not fish for them especially?—No.

2577. Has the herring-fishing within your experience declined?—Yes, greatly.

2578. Do you agree with the last witness that so many herring do not now come off this coast as did formerly, or do you think that there are as many, but that you do not catch so large a proportion of them?—We don't see so many.

2579. Do you think the shoals that come off the shore are not so large as they used to be?—They are certainly not so large as they used to be, nor do they last any time on the shore when they do come in. The French boats are constantly shooting among them, even on Sabbath days, and they won't let them have any rest.

2580. Do you agree with what the last witness said about the French fishermen?—Yes.

2581. Is there any particular cause of complaint on that head which he did not mention?—No, I think he spoke very fairly.

2582. Do you agree with him that the principal catch of herring is outside the three-mile limit?—Sometimes they come within the three-mile limit.

2583. But the greatest quantity of fish is caught outside the three-mile limit?—Yes.

2584. You know that the French fishing boats have a right to fish outside the three-mile limit?—I suppose they have, but they don't stand upon the three miles if the herring are there. If the herring are there they will be in among them.

2585. Has this been the case for some years past, or have you been better protected by the assistance of the gunboats during last year?—It has been the case for some years past. They have been mostly there at night.

2586. Did the gunboats when they were out keep the Frenchmen to their own side?—Yes; they would fire a gun and get them all to the off side. But if they went away at night, then the French boats were in upon us again, and they would remain among us during the night.

2587. When the gunboats did attend and do their duty, did you get better fishing?—Yes, I think we should get better fishing. At all events we got this advantage, that we had our gear kept all right. Their boats will not drive with ours. They have kegs and other things for buoys, which go all over our nets and destroy them.

2588. Then not only do they take the fish but they destroy your nets?—Certainly. Every year nets are destroyed, and the boats dare not go "nigh hand" them in consequence.

2589. Would it be of advantage to you if the gunboats stationed here kept the French fishing vessels strictly within their own limits?—Yes, I think it would.

2590. As a line-fisher have you noticed any greater quantity of fish coming in after a south-east gale than after a north-east gale. I speak of the white-fishing?—Sometimes they have been thicker after a gale. They have been driven in off the banks. We have three winds—a northerly wind, a north-east wind, and an easterly wind. They are always on our shore after those winds.

2591. Have you ever noticed a distinction between a north-east and a south-east wind?—We are never particular about that.

2592. (*Professor Huxley.*) You heard what was said about the harm done by the offal being thrown over?—Yes.

2593. Do you agree with that?—Yes, I think it must poison all the ground together.

2594. Is that the reason why you object to it?—Yes, the fish will not lie among it. There have been as many as 100 sail here at a time heaving all the filth over. It is like to lie all over the place, and no fish will stay there. They shift away altogether.

2595. You heard what the last witness said about the quantity of bait—about there being sufficient bait?—Yes.

2596. Do you agree with that?—Yes, we should have had plenty of mussels here if it had not been for the Scotch boats coming down here and sweeping our beds and carrying the mussels away from us.

2597. Is there any regulation about improperly clearing the mussel beds?—No, nobody looks after them.

2598. Does anybody come and sweep them away? Yes, but that is not the case with the scarp which belongs to the Earl of Tankerville. They dare not take them away from there. They breed up there and the spawn comes down on the scarp here and keeps that good. But since they took them from the high land there is no spawn coming down, and we have had to carry them from other places and lay them down on the scarp.

2599. Have you any means of protecting them on the scarp?—Yes.

2600. Who protects them?—Our man; but if he is overpowered by the boats which come down, we turn out and assist him.

2601. Then you have to fight for it, I suppose?—Yes, we turn them out either by foul or fair means; we take their names and the name of their boat.

2602. Do you think that if the mussel grounds about here were all of them properly cared for and protected that you would not be obliged to import bait at all? Would there be enough for you here?—Yes, plenty.

2603. Without importing any?—Yes, and we need not then buy any.

2604. If the mussel beds were properly looked after only the old ones would be taken. If the young ones were left would that be sufficient for you?—Certainly, we take them a certain size. We leave the young ones to breed.

2605. Your complaint of the Scotch people is that they sweep them away young and old?—Yes.

2606. You would not object to their taking the old ones?—They would not take that trouble. They take them altogether; they scrape them up altogether, and fill their boats. Sometimes they have 50 large keel boats with them; one boat will take 20 tons of mussels. They come from Eyemouth and Burnmouth, and they take all our bait away.

2607. Do you think that if the natural mussel banks were properly protected there would be enough for all of you?—Yes.

2608. Have you been a fisherman for a long time?—Yes, for 44 years.

2609. Did you ever hear of any regulation about your not shooting your nets before sunset?—No.

HOLY ISLAND.

J. Morton.

25 Sept. 1863.

2610. Did you ever hear of any law in reference to the herring boats which requires them to carry any particular vane at their masthead, and which requires line-boats to carry a vane of another colour?—No, I have heard of the French boats being obliged to have a particular blue flag, but I never saw it used.

2611. Do you know anything about having to go outside where the nets are shot?—No, I thought that the French fishing boats had to go outside of us.

2612. But if the French boats have shot their nets first, ought you not to go outside of them?—No, I think not.

2613. Do you not know that you are liable to be fined for not doing so?—I never heard anything of there being any fine for that.

2614. Do you know at what time of the year the haddocks spawn?—About February, I think. They go off from our grounds about then.

2615. About February and March?—They go away to the banks about that time and leave us. I have heard an old fisherman say that on the 16th of February he had plenty of haddocks and the next day he did not get one at all. They were all clean gone.

2616. Where did they go?—To the banks, I suppose. We can scarcely get any haddocks after they go away, except little small ones.

2617. Did you hear what the last witness said about the Scotch boats?—Yes.

2618. Do you agree with him?—Yes, I believe the fish have fallen off ever since they went off to these banks to fish them. We used to have plenty of haddocks close in, but since they took off there we can get none to pay us. At that time we took the outer fishing in the offing and now it is not worth our while to go. I have got plenty of haddock there in my time, 40 or 50 score in a day. Now we can get none. That is a sign that they have destroyed the fish, by fishing on those banks, and catching both young and old. They get plenty that are not worth eating.

2619. Then do you think that the Scotch fishermen have done you all the mischief in your fishing, and not the trawlers?—We have had no trawlers down here.

2620. Then you cannot say that the trawlers have done you any harm?—I don't know whether they have or not; if they come down here they will do us far more harm.

2621. You do not think that the trawlers fishing down below North Sunderland will do you much harm here?—Yes, if they were at North Sunderland, I think they would.

2622. How would they injure you?—They would take the fish. The fish do not bide always in one place. In the summer time and in the winter time we get very few codfish. Now they are falling in after the herring. When the herring go away they will go where the herring are. They may go away far north. We get very few cod all the winter through.

2623. You heard what the last witness said about protection from the French?—Yes.

2624. Do you think he is right in the opinion he expressed?—Yes.

2625. What do you think is the protection requisite?—I think the gunboats should be here.

2626. How far off would you keep the French?—I don't know how far off. Sometimes we have to go further off ourselves, and we think the Frenchman should not be there where we are.

2627. You would keep him out of your ground altogether?—Yes, clear of us altogether.

2628. So that wherever you went you would have the Frenchman well outside?—Yes.

2629. And you wish to have a gunboat to go after you and see that he did so?—Yes.

2630. Have you ever heard of herring being caught here in January?—No, we never catch any at that time.

2631. Do you see an 'appearance' of herring at that time?—At one time they were seen, but none were caught. The spawn was there, and we caught the haddocks feeding on the spawn.

2632. In what month was that?—It was in the winter time.

2633. In what year was it?—17 or 18 years ago. It is a good time since.

2634. And at that time the herring were spawning?—Yes, it was the same kind of herring that they were getting at the Firth of Forth.

2635. You found the haddocks full of their spawn?—Yes.

The witness withdrew.

B. Kyle.

Benjamin Kyle called and examined.

2636. (*Mr. Caird.*) Have you long been engaged in the fishing here?—About 20 years.

2637. Have you heard the evidence of the witnesses who have already been examined?—Yes.

2638. Do you agree generally with them that there has been a falling off in the white fish and in the herring?—Yes.

2639. In your experience has the size of the white fish decreased as well as the quantity?—The haddocks are much smaller. There is not so great a difference in the herring, but the haddocks are a great deal smaller.

2640. Have you any observations to make with regard to the interference of the French fishing boats?—I think that the greatest damage is done to us within the three-mile limit.

2641. Within the three-mile limit?—Yes, I think we sustain less injury when we fish about five miles off. The principal damage is done when the shoals come in shore.

2642. If the French boats were kept strictly without the three-mile limit, do you think that your fishing would be better?—Yes, I think so.

2643. Then, it would be a matter of importance to you that the convention should be carried out?—Yes.

2644. Would that remove much of the objection which is made now with regard to the injury done by the French?—Yes, I think it would.

2645. Do you find that the shoals of fish are broken in any way by the French throwing over the offal from the boats?—Yes, a great deal of injury is done in that way.

2646. Has it any effect in attracting the dog-fish?—Yes, the dog-fish will follow everything.

2647. And if the dog-fish are attracted, do they frighten the herring?—Yes, and they do a great deal of damage.

2648. Have you observed that with your own eye?—Yes.

2649. (*Professor Huxley.*) Where is most of your herring-fishing done; how far from the shore?—It is generally within the three-mile limit. When we have any shoals to do us any good they are generally within the three-mile limit.

H. Macdonald.

Henry Macdonald examined.

2650. (*Mr. Caird.*) Are you a native of this place?—Yes.

2651. Have you been long engaged in the herring-fishing?—I have been 13 years at the herring-fishing, and I have gone to the white-fishing for a season or two.

2652. What observations have you to make with regard to the herring-fishing?—With regard to the herring-fishing, what has been stated by the other witnesses is correct. After we have shot our nets the Frenchmen will come and shoot their kegs alongside of us, and if we say "Oh don't shoot there," they

HOLY ISLAND.

H. Macdonald.

25 Sept. 1863.

will say "We don't care for you, John Bull." At night, after dark, their boats are sent out to protect their kegs at the trail, and they will come to our trail and haul us up. They will take up half of our nets in their boats and go off with them.

2653. That is plunder, then ?—Yes.

2654. Is that done within the three-mile limit ?—Yes, and without it too.

2655. (*Professor Huxley.*) But surely you know that that is against the law ?—Of course it is.

2656. Why did you not take their number ?—You cannot get it. You only see them fishing and you cannot leave your nets.

2657. (*Mr. Caird.*) Have you no gunboats going backward and forward ?—Yes; but suppose there is a large shoal of fish off Holy Island, you will have Sunderland boats, Holy Island boats, Craster boats, Berwick boats, and other boats all running from Sunderland to Emmanuel Head. But the gunboats are at Berwick. The Frenchmen come in at the Sunderland end, and they will shoot away, and all the damage will be done before the gunboats can get there.

2658. Then how would you remedy that difficulty ?—I would have two or three guard-boats to row about.

2659. Guard-boats attached to the gunboats ?—Yes.

2660. If that were done with greater vigour, would it give you much greater protection ?—Yes.

2661. Is there any other observation you desire to make ?—I quite agree with what has been stated in reference to throwing the offal—the herring guts—overboard. I have no doubt that it gathers dogs, because if you only shoot your nets, and want to try your line, if you will send a herring down you will see the dogs take it. There are a great many heads of herring among the offal, and when they are thrown overboard they collect all the dogs together. When they come they don't go among the body of the herring, but they keep to the outside or the inside, and they will start them off the ground. The Frenchmen will come down here and before the fish can get gathered into a large body they are off 10 or 12 miles away. As the Frenchmen sail about backward and forward it does not matter very much to them, but it makes a great difference to us. The Frenchmen shoot among them, but they are allowed to do so because it is beyond the three-mile limit. They shoot with all their boats, perhaps 100 or 120 sail among them, and the consequence is that the herring never get a chance of gathering into a body and coming in to our shores. Nearly all of them are caught before they can do so, and they get entirely broken up.

2662. But if that is outside the three-mile limit the gunboats could give you no assistance ?—The Frenchmen are a parcel of thieves, Sir; not one of them, but the whole lot; and if you say anything to them, and there are plenty of them speak very good English, they will tell you, "No care for you, John. Take it out of that" (*making a derisive movement*). I remember when one of the French vessels came down upon us I pretended to take a piece of paper out of my pocket and looked for his number in order to take it down, when he called out, "Oh John, me no care for that." Upon that occasion we had to haul in our nets, or they would have been destroyed.

2663. Was his number quite plain ?—Yes.

2664. Then you could have taken his number ?—Yes, but we thought it better to haul in our nets. He knew quite well before he got his nets in that he could not get clear of us; we knew so too.

2665. So you got out of the road ?—Yes, we got from 15 to 20 barrels of herring before we did take out, and if we had not been interfered with we might have got 40 or 50.

2666. Do you agree with the previous witnesse, that if the Frenchmen were kept without the three-mile limit it would be of advantage to you ?—The biggest shoals of herring come in within the three-mile limit. When they come within three miles all the boats get good fishing. Occasionally, since I have been at sea, all the boats would average 30 barrels for a night's fishing.

2667. What will they average now ?—Average! why not five.

2668. What did they average this year ?—Why, I should say, that the best fishing night we have had this year would not average 10 barrels.

2669. You mean the best fishing night this season ?—Yes, this season; the best shot of herring was 11½ barrels, and I have had 35 and 36 for a night's fishing. But that has been when we had a clear berth and had none of these Frenchmen driving.

2670. Then you think it is the want of protection that spoils your fishing ?—Yes, that causes us to lose our fishing. The Frenchmen take our herring away and they take our money away as well.

2671. Do you think that you would derive great advantage from having the Frenchmen kept outside your limits ?—Most undoubtedly we should.

2672. Would you keep them further out than that ?—I would keep them away on their own coast altogether.

2673. But still if you had protection for the prescribed limit, it would be of great advantage to you ?—They must be kept either on the off side or on the inside of us. If they are within our fishing they would injure us.

2674. Do you agree with what the previous witnesses have said about the French boats shooting their nets without any regulation ?—Do you mean before sunset ?

2675. Yes.—I do not suppose that any of our boats do shoot until after sunset. We shoot our nets just as the sun is going down.

2676. But with regard to the French fishermen, how do they do ?—Why, as soon as they see us coming off, if the herrings are three or four miles off, they are on the ground before us, and down go their nets. They had capital shots the night before last, the night before that, on Saturday night, and on Sunday night. When we went off they were all anchored and we had to go round them. As soon as we got to the other side it was up with the anchor and shoot away. They were hauling plenty of herring and we got none.

2677. Was that outside the limits ?—No, it was within the limits.

2678. Then why, when you took their number, did you not make a complaint ?—I had no paper or pencil, I only made a pretence of taking their number.

2679. Could you not recollect the number ?—No, it would have been a matter of difficulty.

2680. Are you aware that the state of the law is exactly what you wish it to be ? If you shoot your nets first the French fishermen have no right to shoot within half a mile of you ?—Then what is the reason they do it ?

2681. If a Frenchman comes within half a mile, either to windward or leeward, you can take his number, and if you lodge a complaint against him he will be punished. Are you not aware of that ?—Yes.

2682. That is the law now ?—Yes.

2683. Do you think you would have sufficient protection if the existing law were enforced ?—Provided the gunboats would do their duty I think we should.

The witness withdrew.

J. R. R. Lilburne.

JAMES ROBERT RODDAM LILBURNE examined.

2684. (*Mr. Caird.*) You are a retired officer of the navy, I believe ?—Yes, on the reserve list.

2685. Have you been long resident here ?—Not very long; I only came here lately, and have been here about three years.

2686. Do your experience and knowledge enable you to speak of the fishing here ?—I have nothing to say with regard to the fishing, but I wished to make a statement in reference to the Convention which I have had to put in force both off this coast

and Yarmouth, as well as in reference to trawling all over the North Sea.

2687. Had you occasion to study the articles of the Convention continually?—Yes; one of the articles of the Convention says that decked boats shall shoot half a mile to leeward or windward of undecked boats. I think it is perfectly impossible to do that. The herring is a fish that lies close, in shoals, and you have all the boats lying within yards of each other instead of half a mile.

2688. Then do you think that that article of the Convention is a dead letter?—Yes, quite a dead letter.

2689. (*Professor Huxley.*) Why is it impossible to carry it out?—The fish are there in such numbers that it would be impossible to make a distinction. There would be none of the boats there to carry on the fishing if that article were strictly carried out.

2690. (*Mr. Caird.*) Then do you think that that is an article that ought to be amended as being impracticable?—Yes, I do not think it possible to carry it out.

2691. Is there any other article that you consider impracticable?—I do not think that the French boats ought to be allowed to carry on their fishing operations within the limits laid down in the Convention, nor ought they to be allowed to remain within the limits if they get within them.

2692. But the Convention provides that they shall not do so?—But they do so constantly.

2693. That is because our police are not sufficient?—Yes. They not only do this, but they remain inside not awaiting a favourable opportunity to go to the fishing ground outside, but they remain watching our boats instead of going outside the limits.

2694. Are they not prohibited by the Convention from doing that?—Yes, but there is no protection. I have seen them carrying on their fishing in the harbour within 100 yards of the Alert.

2695. When you were in the command of a cruiser what did you do?—I did prevent them as far as I could.

2696. Do you think that a large ship like the Alert is an improper ship to send down here to protect the interests of the fishermen?—Not at all, if she made use of her boats. She has three good boats, and she might have them out every night, and gunboats might go round the coast every morning and bring in the rowboats. I believe that up to the 31st of August the pinnace was only out one night. The French fishermen were here on the 29th of August, on a Saturday, they shot their nets on the Sunday, and went to France loaded with fish on the Monday. That was told to me by the lieutenant of the Cuvier.

2697. Do you think that the sending out of rowboats would be a better protection for the fishing than sending out gunboats?—Yes, because rowboats can go in among the fishing boats better than gunboats.

2698. Would they receive as much attention as the gunboats?—They could take the numbers of the fishing boats and report them to the gunboat, who would take them in tow.

2699. What suggestion would you offer as to the best vessels for service in protecting our fishermen from the Frenchmen?—The vessels employed should be gunboats with more men and boats attached to them.

2700. How many boats would be necessary to protect the coast of Northumberland?—I should say that three would be ample.

2701. They would be sufficient from the Tyne to the Tweed?—Yes. The herring are never always in one place. They move about. The gunboats could go about and ascertain where the herring are.

2702. Do you think that three gunboats would be better than the Alert?—Yes; she has done nothing to protect the fishermen.

2703. Is there any other article of the Convention to which you wish to call attention?—With regard to the pennant they are to wear when on the coast of France, is that only to be displayed here when they are within the limits of the fishing grounds?

2704. (*Professor Huxley.*) It applies to all cases. Have you anything to say with respect to the trawlers?—With regard to the trawlers I think they do a great deal of damage in consequence of the meshes of their nets being so small. I have watched them close to the Texel, and have seen them take on board an enormous quantity of offal, especially red gurnet. All this had to be thrown overboard whenever they hauled their nets up.

2705. (*Mr. Caird.*) Were the fish dead?—Yes; they were not marketable fish.

2706. Have you observed the deep-sea trawl-boats?—Yes.

2707. Do they bring up a large quantity of immature fish?—Yes, and that is because the meshes of the net are too small.

2708. What do they do with the small fish?—They throw it overboard.

2709. They are thrown overboard?—Yes.

2710. (*Professor Huxley.*) Allow me to ask you a question with regard to the state of the law. The first article of the Convention is that "British and "French subjects fishing in the seas lying between "the coasts of the United Kingdom of Great Britain "and Ireland and those of the kingdom of France, "shall conform to the following regulations." Therefore the whole of the regulations apply to British and French subjects fishing in the seas lying between the coasts of France and Great Britain?—Yes.

2711. They apply as much to the French fishermen as to those of this country?—Yes; then they may fish from John o'Groat's to Dunkirk.

2712. Yes. The regulations are as binding upon Englishmen going out from their own ports as upon the French fishermen coming here. The 50th article says: "For the purpose of distinguishing by day drift-"net fishing boats from trawl-boats, both shall carry "at the masthead vanes, which shall be at least 8 "inches in height, and 2 feet in length. The colours "of these vanes shall be for British trawl-boats, red; "French trawl-boats, blue; British drift boats white "and red; French drift-boats, white and blue. It is "understood that the vanes of drift-boats shall be "divided vertically into two equal parts of which the "white shall be nearest to the mast." You see the law is absolute?—Yes, between the two seas.

2713. The 51st article says:—"It is forbidden to all other fishing boats to carry vanes similar to those mentioned in the preceding article." So that the Act clearly contemplates that all drift-net boats and all trawling boats shall have vanes. It is however a nice legal point whether it should be inside or outside of the limits?—Drift-net boats have no standing masts, therefore I cannot see how the Act is to be carried into operation. They could not work their nets if they had masts.

2714. Surely they have a mast for their sail?—Yes, but they are obliged to lower the mast down into the boat.

2715. But the mast might carry a vane at the end of it whether it was lying down or not?—Yes, but it would be undistinguishable. With regard to the practice of throwing offal overboard, I believe that it accumulates dog-fish. Crabs have also accumulated very much during the last 25 or 30 years, and they pick up the spawn lying on the ground.

2716. Do you think there is a possibility of enforcing the regulation with regard to the French boats not shooting their nets inside the English nets, and *vice versâ?* I understood you to say that that is impracticable, on account of the number of fish?—Yes.

2717. But suppose that the English fishermen shoot their nets in a shoal of fish, the law is that the French shall only shoot half a mile to windward of leeward of them?—Yes.

2718. What is there to prevent that regulation from being carried out?—Because they all shoot together.

2719. But they are forbidden to do that.—Then if the decked boats shoot among the fish the undecked

HOLY ISLAND.

J. R. R. Lilburne.

25 Sept. 1863.

boats may not come within half a mile of them. Say for instance that the Yarmouth boats are there and have shot their nets, must our boats wait until they get half a mile to the windward? I think it would be impossible to carry that out.

2720. How so?—Because they cannot do it.

2721. But that is what the law contemplates, because it says if the undecked boats have shot their nets first then the decked boats shall not shoot within half a mile of them?—If you were to carry that out you would prevent the decked boats from fishing at all.

2722. That is clearly what it contemplates. On the other hand it operates equally hardly upon the English fisherman, because if the decked boats shoot their nets first, then the undecked boats must only shoot half a mile off. That is the state of the law, and you cannot doubt that it is possible to carry it out. It would be perfectly easy to carry it out, would it not?—Perhaps so, but you would prevent one party from fishing at all.

2723. (*Mr. Caird.*) And by that means you would lose a good deal of fish?—Yes, I think so. The consequence of enforcing the law would be this: Some 50 or 60 decked boats would shoot their nets, and they would keep 50 or 60 boats outside of them. They would fish on a small spot of ground, and would occupy the whole of it. The fishermen with the undecked boats could not shoot their nets at all and they would be compelled to go half a mile to leeward or windward, clear of the fish.

2724. (*Professor Huxley.*) That is what I wanted to get your opinion upon, namely, if it is possible to carry this law out?—It is possible, but I think it would work most disadvantageously to our own men.

2725. If it were carried out, and the French fishermen minded what they were about, they would exclude all the English from the fishing?—Exactly so.

2726. So that the strict enforcement of the terms of the Convention would positively restrict any Englishman from catching fish outside the limits?—Yes. Inside the limits they might fish.

2727. But at the same time it is perfectly practicable to carry the law out?—Yes, but I never looked at the law in that light.

2728. You were always looking at the limits of the shoal?—Yes.

2729. But the Act says nothing about that, and the effect of enforcing a compliance with the provisions of the Act would be to cut our own fishermen out completely?—Precisely.

2730. That is not what you imagine could have been meant by the Convention?—No.

2731. (*Mr. Caird.*) Have you any other remarks to make with regard to the Convention?—No.

2732. Nor as to the fishing?—I only know from my own knowledge that there is not the same quantity of fish caught as was caught formerly.

Adjourned until Monday, September 28th, at Sunderland.

Sunderland, Durham, 28th September 1863.

PRESENT:

JAMES CAIRD, Esq., M.P. (Chairman). | Professor HUXLEY, F.R.S.

JOHN PURVIS called and examined.

SUNDERLAND.

J. Purvis.

28 Sept. 1863.

2733. (*Mr. Caird.*) Are you a fisherman?—Yes.

2734. Where are you a fisherman?—At Whitburn.

2735. How many years back does your recollection of the state of fishing there extend?—I have been fishing there for upwards of 48 years.

2736. Have you observed in the course of those 48 years any considerable change in the number of fish caught and brought ashore there?—Yes, there has been a very great change within these last four years.

2737. The change you have observed has been chiefly within the last four years?—Yes.

2738. Has there been any increase in the number of fishermen on that station within the last 48 years?—Yes, there are now three boats more than when I went to sea.

2739. Has there been any increase in the number of boats during the last four years to which you have just referred?—No.

2740. With regard to the diminution in the quantity of fish, has that been most striking within the last four years?—Yes, it has.

2741. Has there been any perceptible change in the quality of the fish as well as in the quantity?—Yes, I think there has, as well as in the quantity; the fish are not so large now as they were some years ago.

2742. In what kind of fish generally have you noticed a diminution in the supply?—Our haddocks particularly are less in size.

2743. The haddocks?—Yes, the haddocks have fallen off in size a great deal; I consider that the size of the haddocks now is nothing to what it was four or five years back. What we now call a large haddock is not as large by one-third as they were some years ago.

2744. And in regard to the quantity of the haddocks, I understood you to say that the diminution has been also very great?—Yes, very great indeed.

2745. Can you put a figure upon it; take a boat's catch now, and compare it with a boat's catch within your experience some years ago. It is not necessary that you should go so far back as 48 years, but compare it with what a boat's catch would be 10 years ago?—Well, 10 years ago we should average 30 or 40 and even 50 stone in a boat.

2746. And what will a boat's catch average now?—It is considered a very good take of fish to get now in the winter time 20 stone, but I should say that the average would not be more than 10 or 12 stone.

2747. Then, the average has fallen off until it is only about one-fourth of what it used to be?—Yes, something like that.

2748. And what is the difference in the price now as compared with what it was 10 years ago?—The price of fish formerly was a great deal cheaper than what it is now. I should think that a fisherman's earnings in a boat employed in fishing now is only about one-third of what it used to be.

2749. Taking into account the increased price and the diminished quantity caught, are the earnings of the fishermen equal to what they were 10 years ago?—They are certainly not equal to what they were 10 years ago.

2750. Does not the difference in price compensate the fishermen for the falling off in the quantity of fish taken?—No, it does not.

2751. Then, the fishermen are not so well off now as they were formerly?—They are not so well off by far. For my own part, I could not have maintained myself and brought up a family as things are now if they had been no better in my day. I have brought up 10 children.

2752. What mode of fishing do you adopt in line fishing?—Do you mean what do we catch?

2753. No, how do you catch your fish?—We catch cod, ling, skate, and other fish with a hook.

2754. Do you use the same bait for all those fish?—Yes.

2755. What bait is it that you use?—Limpets and mussels. That is the bait we generally use on that shore.

SUNDERLAND.

J. Purvis.

28 Sept. 1863.

2756. Where do you get your bait?—There is a very good supply on our own shore near to Stockton-on-Tees.

2757. Have you had any difficulty with regard to obtaining bait?—We sometimes had a poor supply of mussels, but we could always get limpets—'flitters' I think you call them in the South—things with a round shell.

2758. Does the difficulty you experience in getting bait at all impede your power of fishing?—I do not understand your question.

2759. Is there any such difficulty in getting bait as to prevent your fishing with your former success?—No, we can get plenty of bait to catch the fish with if there were fish to be caught. We generally carry out now more line than we used to take, and yet we get less fish. The same boat that was employed years ago would use much more line now.

2760. How much more line would it use?—From 400 to 500 hooks. We have that number of hooks on a line, and we take seven and sometimes eight of them to sea in a morning.

2761. How many did you take when you first began to fish?—Sometimes six or seven in a boat, but not regularly.

2762. And did they have the same number of hooks?—Yes, about the same number of hooks.

2763. Have you in any way altered your mode of fishing in that time?—No, we have not.

2764. Do you fish now exactly in the same way that you used to do?—Yes, we fish now in the same way as when I first went to sea at 10 years of age.

2765. Then you have not observed any necessity for improving or altering your mode of fishing?—We might observe that there might be a necessity to try an improvement if it could be made, but we cannot see how we can introduce much improvement with regard to fishing with lines. We have tried many schemes, such as making our lines smaller in the winter season, so that we might be enabled to catch more fish, but, notwithstanding, we find the fish growing less and less in quantity every year.

2766. How has it been with regard to the quantity of cod?—There has been a great decrease in regard to cod likewise.

2767. Has there been a decrease in the size and quality of the cod?—There has not been so much difference in the size of the cod, but there has been a great difference with regard to the skate. When I first went to sea, up to five years back, I have seen the boats bring from 50 to 100 large skate ashore in the summer season, and now you scarcely see a boat bring one or two ashore in the course of a day.

2768. Is there any other kind of fish that has very much fallen off besides the skate?—No, I think not; there has been very little falling off in any other kind of fish caught with the hook.

2769. Is the hook the only mode of white-fishing you practise here?—Yes; along this coast we use nothing else.

2770. Do you get any turbot here?—Yes, I have been catching it almost all my lifetime, ever since I went to sea. I suppose you mean what we call 'bratt'.

2771. Do you find any diminution in the quantity of turbot caught now as compared with what was caught in former years?—There has not been a very great amount of turbot, but we don't fish for it now as we used to do. The smacks have completely put an end to our trying for turbot. The trawlers are always oversetting our nets.

2772. In what way?—During the last six years I have had them set six different times and they have always been taken away by the trawlers. I have had them caught by the trawlers and carried away by the trawlers, and once I had them dredged in a heap altogether.

2773. Do you mean by the trawl-boats passing over your nets?—Yes. I remember in one shot I got upwards of 30 fish, good-sized fish; the trawlers came then, and that is the only shot I got out of them. Even this year I durst not put my nets into the sea on account of the trawlers. If I had done so I should have lost them altogether, and they would have been taken quite out to sea.

2774. Then you cannot fish because of the trawlers?—No.

2775. I understand you to say that you do not think the fish has diminished in quantity, but that your power of catching them has diminished?—Yes, we could get plenty if we were only allowed to put our nets into the sea without running the risk of having them taken away by the trawlers.

2776. When did that difficulty first arise?—I should say about four years since.

2777. Did you fish for soles then?—Yes.

2778. Did you trawl for soles?—We formerly trawled for soles, but now we fish for them with the line.

2779. Has the quantity of soles caught here increased or diminished?—It has diminished a great deal within the last 10 or 12 years, and lately it has decreased more than ever.

2780. Has there been a gradual diminution within the last 10 years?—Yes, a very great diminution indeed, with regard to in-shore fishing. We always trawled close in-shore.

2781. Have you discontinued trawl-fishing altogether?—Yes, many of us have done so. We go now herring-fishing.

2782. Do you attribute the falling off to the fact that you discontinued trawl-fishing?—No, I judge that the falling off has been in consequence of the spawn having been taken away or destroyed.

2783. I understand you to say that you do not take the same means of catching them that you formerly did?—No; we use lines now and formerly we used nets.

2784. Do you think you get as many with the lines that you use now as you did formerly with the nets?—Yes, I think so, and we get better fish.

2785. Then it is not the line-fishing that has occasioned the diminution in the number caught?—No.

2786. Do you believe that the number of soles has in reality diminished?—I think they have in-shore; but not in the offing, if the trawlers would only let them alone.

2787. How are you able to say that the number of soles caught has not diminished in the offing, whilst they have diminished in-shore?—Well, I believe that they breed in the offing, and I think they come from there in-shore.

2788. Then how is it you arrive at the conclusion that they have not diminished there?—I come to the conclusion for this reason: if it were not for the supply of soles that we get from the offing we should never have them in-shore at all.

2789. You believe they have not diminished in the offing; now what means have you of ascertaining that?—I don't believe that they have diminished except it has been in consequence of the trawlers. They will not leave anything on the ground if they are allowed to trawl over it.

2790. Did you ever fish for soles in the offing yourself?—No, I never trawled at all in the offing for soles.

2791. Where do you fish for soles now?—I fish for soles very close in-shore.

2792. With a hook and line?—Yes, I use a line if I fish at all, but I don't often go. There is only one boat that goes out of this place trawling with a trawl net.

2793. Do you get any salmon or salmon trout on this shore?—No we do not.

2794. You get no salmon trout?—We may get one or two occasionally, but we are well aware that we are not allowed to catch them. I believe there was an Act passed a short time ago to regulate the salmon fisheries. Perhaps you will remember it.

2795. Have any restrictions been placed upon you on account of the mode which you have adopted for fishing salmon?—Yes, I believe so.

SUNDERLAND.

J. Purvis.

28 Sept. 1863.

2796. What mode was it then that you adopted?—Well, there is a gentleman here present much more accustomed to this sort of thing than I am, and perhaps he will explain it to you.

2797. You have not practised fishing for salmon trout much yourself?—No.

2798. Are there any mackerel off this shore?—Yes, plenty.

2799. Do you fish for them?—No, I do not.

2800. Do you not consider it worth your while?—No; we are generally engaged in the herring fishery at the time the mackerel appears here. The mackerel generally comes astern of the herring, and we catch part mackerel with the herring. But so far as fishing for mackerel itself is concerned we have not fished with mackerel nets now for a good while.

2801. You think the mackerel come in here with the herring?—They generally come after the herring.

2802. And can they be fished at the same time?—Yes.

2803. You find the herring fishery a profitable business?—Yes, until within the last few years, when we found that the herring was falling off.

2804. Have you ever seen the mackerel off this coast when there was no herring?—Yes, we have sometimes.

2805. And have you never fished for them then?—Yes, occasionally.

2806. But you do not practise mackerel-fishing as a general trade?—No, not so much as we did formerly.

2807. Did you find that it paid well, formerly, when you did practise it?—Not very well, we never got any great take of it.

2808. What was the cause of that? Why did you not catch them here as well as at other places?—I think the reason was that we had not enough nets for shooting around the shoals.

2809. You had not enough nets?—No.

2810. Would it not answer your purpose to get new ones?—Yes, I believe it would if we could afford to get them.

2811. Do you get any oysters off this shore?—No, none.

2812. Do you get any crabs or lobsters?—Yes, plenty; we used to get plenty formerly.

2813. Have you noticed any diminution in them lately?—I have.

2814. In which of them have you particularly noticed a diminution?—In lobsters particularly, but we attribute that to the ballast a good deal.

2815. What do you mean by that?—I mean that they have greatly decreased in consequence of a practice that prevails of taking the ballast out of the harbour and heaving it out at sea on the ground where the lobsters generally breed.

2816. What is the practice with regard to depositing ballast at sea here?—All I know is that they take it out of the harbours in large vessels, and they cast it into the sea and it washes about until it fills all the lobster holes up.

2817. Is there any rule with regard to depositing ballast to this effect, that the ship which takes it out to sea shall carry it a certain distance?—Yes, I think there is.

2818. Can you speak upon that point precisely?—No, I cannot.

2819. But you know that injury has been done to the shell-fishing in consequence of the ballast having been deposited upon the places where you have been in the habit of fishing?—Yes, I am quite certain that very great injury has been done.

2820. Will you explain in more precise terms what the injury is which has been sustained?—The ballast washes ashore on our beach and also into our mussel beds. Formerly we put our mussels down close in shore and we had no ballast to interfere with them. Now, since they began to deposit the ballast out there, I have seen many a time in the winter all the beds covered with ballast.

2821. Do you mean that the ballast has been driven ashore by the waves?—Yes.

2822. And the ballast washes into the holes where the lobsters and crabs take shelter?—Yes; there are some holes from which we have been in the habit of getting three or six lobsters at a time, and these holes are now totally filled up with ballast.

2823. At what distance is that from the shore?—I believe the buoy stream is in about 10 fathoms of water.

2824. Could any regulations be adopted to render it compulsory for the ballast to be taken further out to sea, so that it would do you no injury?—I don't think it would be any advantage to us even taking it further out to sea.

2825. Then do you object to its being taken to sea at all?—Yes, I do.

2826. Are you of opinion that if it is deposited at all in the sea it must injure the fishing?—Yes.

2827. How long is it since you observed any injury to the fishing in consequence of the deposit of ballast?—It has been injuring us for the last 20 years or more.

2828. Has the injury increased lately, or has it diminished?—It has increased.

2829. Do you mean that you have observed a diminution in your supply of shell-fish during the last 20 years?—Yes.

2830. Do you find that there is a diminution in the lobsters particularly, or both in lobsters and crabs?—There has not been so much diminution in the crabs as in the lobsters.

2831. Can you give us any reason for that?—No, I don't know what the reason can be. A lobster will take his hole more than a crab. A crab takes his seat anywhere, whilst a lobster is a thing that must seek shelter under the ledge of some rock.

2832. Do you fish lobsters more closely than crabs?—We fish for both but we cannot get crabs so frequently as lobsters. We get more lobsters in the winter time than in the summer, until the month of May when the crabs come in plenty. That has not been the case, however, for a few years past. They have not been so plentiful as they used to be.

2833. With regard to the herring-fishing, have you observed whether it has been increasing or diminishing on this coast?—It is greatly diminishing.

2834. Can you state whether the herring-fishing or the other sea fishing was most remunerative to the fishermen here in former times?—I think we should get most from the white-fishing, because that lasts all the year round or nearly so. We only go for about eight or 10 weeks to the herring-fishing, but the white-fishing is all the year round, and turbot-fishing is carried on during the summer season.

2835. When does the herring-fishing usually begin here?—About the month of July.

2836. And within the last 10 years have you noticed any decided diminution in the catch of herrings?—Yes; there has been a little diminution every year within the last 10 years, but within the last three or four years there has been a great diminution in the take of herrings.

2837. The diminution has been chiefly within the last three or four years?—Yes.

2838. How many boats are employed by you in the herring-fishing?—About 14 or 15.

2839. Has the number increased during the last 10 years?—I think within the last 20 or 25 years we have increased about three boats.

2840. And that increase has continued up to this time?—We have not had a great many more up to the present time.

2841. Has the quantity of herrings caught by each boat fallen off considerably?—Yes.

2842. Are you enabled to state what a boat could catch in a season a few years ago?—Perhaps our take might be somewhere about 100*l.*

2843. 100*l.* worth of fish?—Yes; some seasons from 80*l.* to 100*l.*

2844. Is that 10 years ago?—Yes.

2845. And what may be the value of your take now?—From 20*l.* to 30*l.*, and from that to 40*l.* But

I think there are very few boats in our place that have averaged 40*l.* this year.

2846. Will you have the goodness to state what was the price of a barrel of herrings 10 years ago?—I can hardly give you that correctly, but I daresay it would be from 16*s.* to 18*s.*

2847. And what is the average price now?—About 11*s.* or 12*s.*

2848. Is that all you get now?—Yes. But we don't sell the herrings by the barrel. We sell them by the thousand.

2849. But you know the price of a barrel of herrings?—Yes, I have heard the price very frequently named in the North.

2850. Would it be more convenient for you to give the price in a different way?—Yes, I can give it per thousand.

2851. Then what was the price of 1,000 herrings 10 years ago?—It would be somewhere about 2*l.*; it would range from 30*s.* to 2*l.*

2852. What is the price now?—We sold them this last year at the same price. Sometimes we get less and sometimes we get more.

2853. Has there been very little difference in the price of herrings during the last few years?—I don't think there has been much difference in the price, but there has been a great decrease in the quantity taken.

2854. Then the price of herrings has not increased during the last 10 years in the same way that the price of all other fish has increased?—I cannot say that it has. I don't know very much of the subject. I am very little acquainted with the price. But I know that the quantity has very much diminished.

2855. Has your mode of fishing herrings changed in any way in the course of your experience?—No, but the boats are a little larger than they were.

2856. What do you think is the cause of the decrease in the quantity of white fish?—I believe it is owing entirely to the destruction of fish occasioned by trawling.

2857. Do you mean by the deep-sea trawlers?—Yes.

2858. Are there any deep-sea trawlers in your port?—Yes, last year we had as many as 15 here.

2859. Do any of them hail from your port?—No, none of them.

2860. Do any of the deep-sea trawlers come fishing near your shore?—Yes, they are very near our shore sometimes.

2861. How near do they come?—Well, I should say that they come within three miles very often.

2862. Have you ever been alongside of a trawler when she was fishing?—Yes.

2863. Have you seen the trawl drawn up?—Yes; I have seen it drawn up at a distance, and I have seen our gear taken up by them. We have often had our nets taken up and our lines destroyed.

2864. When you sustained an injury of that nature did you not make a complaint?—Yes, I have made a complaint, but I got no redress.

2865. Were you not able to ascertain the number of the boat that did you the injury?—No, it was very difficult to do that. The boat that took away my gear had neither number nor name that I could discern.

2866. Is that frequently the case with the trawlers?—I think it has been with regard to the trawlers off this coast. I believe that many of them have neither had name nor number.

2867. Have you ever yourself seen a trawl taken up?—No, I have not seen it close at hand.

2868. With regard to the herring fishery, have you any reason to give as to the falling off in the take of herrings?—I have no reason to give in particular, but I think that the French fishermen impede our business a great deal.

2869. Do they fish off your shore?—Yes, they shoot their nets close among ours, and they plague us very much, especially if they get to windward of us. In that case they drive down upon us and we are obliged to haul in. If we did not we should lose our gear.

2870. I believe that your boats and gear are much lighter than those of the French fishing boats?—Yes, and we are shorter handed than they are.

2871. Do they come within the three-mile limit to fish?—Yes; they are not at all particular about that. I have seen them fishing not above a mile from the shore.

2872. Do they observe any regulation as to the time they shoot their herring nets?—No; they generally take an advantage of us, and they shoot an hour or two before us. Whenever they see our boats coming out they shoot their nets at once; the consequence is that when we get out we find it impossible to get our nets down among them. In point of fact, we dare not go among them for fear of losing our gear, particularly in heavy weather.

2873. Have you noticed, within your experience, whether the herrings are chiefly found within the three-mile limit or outside of it?—I have found herrings both within and without.

2874. In which are they chiefly found?—At the back end of the season they are generally found within the limit and before that period they are a long way without it.

2875. Do you go beyond the three-mile limit with your boats to fish?—Yes.

2876. How far do you go?—Sometimes we go as far as 15 miles off.

2877. Do you follow the shoals?—Yes.

2878. Do you meet with any annoyance outside from the French boats?—There is not so much annoyance outside as there is closer in shore. There is more space for us outside and the French boats are more scattered.

2879. Is there any protection given to you by the Government?—None at all.

2880. Is there any gunboat down here?—We had one down here two years ago, but during the last two years I have not seen a gunboat here at all.

2881. Have you any boat rowing amongst you to keep the fishermen in their proper places?—No, we never see such a thing. We have had a French gunboat this year and for some years past.

2882. Does she interfere with you at all?—No.

2883. Have you ever had an opportunity of complaining that the French came within the three-mile limit to fish?—Yes.

2884. Who did you complain to?—I complained to the people on the shore, and I saw several gentlemen belonging to the Customs.

2885. Did anything follow from your complaining?—No.

2886. Do you think it would be of advantage to you if the French were kept strictly within the three-mile limit?—Yes, I think it would be a very great advantage to us.

2887. Can you suggest any mode by which the supply of herrings could be increased?—No, I cannot suggest any mode, except it would be to keep the boats from going off on the Saturday night and the Sunday night. I think that would be a good thing. It would enable the shoals to draw together, and in that way would be of great benefit to the fishermen.

2888. You are of opinion that both the French and the English should abstain from fishing on the Saturday and Sunday nights?—Yes, and I believe if that were done good takes of fish would then be caught.

2889. Do you think it would be of any advantage to you to adopt a regulation preventing you from shooting your nets until about half an hour before sunset?—We don't often shoot before sunset now. If we shoot before sunset the fish will see the net and they will generally go away from that part.

2890. Do you think it would be of advantage to establish a regulation to that effect?—Yes, I think it would be a very good thing.

2891. Do you think that all the fishermen would be glad if such a regulation were established?—Yes, I think they would.

SUNDERLAND.

J. Purvis.

28 Sept. 1863.

2892. And they would like to have it enforced?—Yes, I have heard several fishermen complain, and express a wish that a regulation of that nature should be established.

2893. Is there any mode in which you fish on this coast which in your opinion is at all wasteful, either in taking fish that are not in a marketable condition or in destroying the spawn?—No, not that I know of.

2894. Are there any existing laws that interfere with the mode of fishing at all?—No, I think not.

2895. Then no authority interferes with you to prescribe regulations as to the size of your nets or the times at which you shall fish?—No, nobody at all.

2896. Could any fence months be adopted with advantage to the fisheries?—No, I don't think there could, but I think that what you have spoken about would be a very good thing if it could be done. I cannot see anything better. Perhaps some one in the room may think it of advantage to do something else, and if so they will tell you in the course of the inquiry. There is one thing that occurs to me now, and that is that the trawlers might be kept away from this part altogether while line-fishing is going on. I would keep them south of the Humber, and not let them go north at all.

2897. You think they injure your fishing?—Yes.

2898. Has the injury they have been doing you increased in recent years?—Yes, greatly.

2899. Do you find that trawl-fishing is gradually coming further north?—Yes.

2900. Within recent years was there a time when the trawlers did not come opposite your shore at all?—Yes; they have only been here during the last six or seven years. Before then we had no trawlers to interfere with us at all.

2901. When did they first come here in any great numbers?—Within the last two years. Prior to that we had only two trawlers, and they have now increased to four or five.

2902. How far north do they go?—I cannot say how far north they go, but I know they have been at Newbiggen. They have been four or five at a time there.

2903. We were told at Holy Island that they don't come there?—No, but they have gone further north.

2904. Do they go further north than Holy Island?—Yes, I believe so.

2905. They go further north than that?—Yes, I read in the papers that they were in the Forth, and that they were driven away by the people who would not let them go there to sell their fish.

2906. Have you noticed whether any particular gale of wind has a tendency to increase the supply of fish?—Yes; a north-east wind used formerly to do us a very great deal of good in our fishing.

2907. Does it not do so now?—No, we have not found that it has had that effect lately. For the last few years we have not noticed any great difference.

2908. A north-east wind does not improve your supply of fish now?—No.

2909. Did a south-east wind have as much effect?—No, not so much effect as a north-east wind.

2910. Then were you able to make any marked distinction between a north-east wind and a south-east wind; do you find that a less supply of fish follows a north-east wind now than formerly?—Yes, the distinction used to be very great at one time, but it is not so now.

2911. (*Professor Huxley.*) I understood you to say that there has been a general diminution in all kinds of fish of late years. When was that diminution first observed?—About four years ago.

2912. Then up to four years ago the quantity of fish taken in any one year would be about the same so far as your recollection goes?—Yes, I think so.

2913. It would be the same as it is now?—Yes.

2914. You wish us to understand that, in your opinion, the quantity of fish from the time you first begun fishing remained the same up to four years ago?—Yes, but there might be seasons when they were not so plentiful.

2915. You have been acquainted with the long-line fishing, I believe?—Yes.

2916. Have you been in the habit of losing much by dog-fish?—Yes, we have lost a great deal of our hooks and snoods.

2917. Do you know a fish that they call the 'sucker'?—Yes.

2918. Do you lose much by the sucker?—When we have our gear lying in the sea,—our big lines,—we shoot them to-day and we don't go near them until to-morrow, and if in the mean time these suckers get at the fish they kill them all.

2919. Can you give me any notion of the average proportion of fish destroyed by the dog-fish and by the suckers; do you lose one tenth, or one twentieth, or one fourth of your catch, or what do you lose?—They are only there at one season of the year, perhaps three or four months.

2920. Can you give me an estimate of the quantity you lose by the dog-fish and the suckers?—Well, taking the average of a number of years, perhaps we might lose one thirtieth part.

2921. You were speaking just now of catching turbot by net. What kind of net do you use for catching turbot with?—We use a net 7 meshes deep and perhaps a 4-inch mesh from knot to knot. We catch no small fish at all.

2922. How long is your turbot net?—About 220 yards long.

2923. Is it a straight net without a pocket?—We have no pockets. The net is hung the same at the top as at the bottom. We have 10 or 12 of these nets all shot on an end.

2924. In what depth of water do you shoot them?—From 24 to 26, and up to 30 fathoms and upwards; just as we find the fish.

2925. Then if you have 14 meshes the net will hang 10 feet deep or a couple of fathoms?—No, not a couple of fathoms. We gather them in at the end and at the sides. Perhaps they will hang about eight feet.

2926. Do they hang from a head-rope?—We have a thickish cord at the head, perhaps the thickness of my finger. It goes along the top. We have also cork at the top, and stones or lead at the bottom. We put the nets overboard and we keep them going before the tide. The corks ride up when the nets are shot.

2927. So that it acts like a herring net in fact?—Yes.

2928. Are the nets made fast at each end?—Yes; we have an anchor at one end and a line attached to the net from the net to the anchor.

2929. So that the nets do not drift?—Yes.

2930. Then they are fixed nets?—Yes, we have a buoy so that we can find them in any weather.

2931. Can you shoot those nets where you like?—Yes, and we shoot them to the best of our opinion where we can get most fish.

2932. How long do you let them remain down?—We generally let them bide for about two days. We used to do that when we were fishing for the Barking smacks. They could come here and take the fish from us and convey it by sea to London.

2933. Are they 'bratt nets' that you mean?—Yes.

2934. Did you ever see such a regulation as this, "Such bratt nets, trammels, or other set of anchored "nets shall not, except in unavoidable cases, remain "more than 24 hours in the sea without being taken "up"?—We cannot take up our nets every 24 hours.

2935. Did you ever hear that such a law was in existence?—No, I cannot say that I ever did.

2936. Then you are not aware that that is part of the Convention between England and France with regard to the fisheries?—No.

2937. Then you would have been somewhat astonished if anybody had summoned you for a breach of the law?—Yes, I should; I never heard of it before.

2938. But it is the law. Do you think there are plenty of turbot still; I speak of bratt?—Yes.

2939. Do you think that the trawlers disturb the spawn of the turbot?—Yes, I do think they disturb

the spawn of the turbot. I think there would be plenty of turbot if the trawlers were put outside of this ground. The turbot we get comes from the deep waters, or we should never have any supply at all.

2940. Do you think that the quantity of soles caught off this coast has not diminished?—I should say it has not diminished much in our part of the coast, but at other places I believe it has. There are some parts in which it has fallen off much more than it has here.

2941. But surely if the trawlers have destroyed the spawn of the soles would not that have affected the quantity?—No doubt of it, but we only fish in-shore for soles, so that I cannot give you a good idea of that sort of fish. We fish for soles with a line in two or three fathoms of water, and from that as close in-shore as one fathom.

2942. Do you think that the quantity of flat-fish that can be caught by the hook and line is as great as that which can be taken by the trawlers? What I mean is, can you destroy as much fish by the hook and line?—I can hardly tell you that, but I think that if the lines were properly baited they would take as many fish.

2943. Do you think that you could bring as many fish into the market by the hook and line as is brought by the trawlers?—Yes, and a long way more if the ground is not disturbed; a very long way more than they bring in now. I don't mean flat-fish exactly, but other kinds of fish as well.

2944. But my question applies more particularly to flat-fish?—I don't suppose that we could bring as many flat-fish on shore with the hook and line as we did formerly.

2945. So that if there was a great demand for flat-fish, the result of catching it by hook and line would be to raise the price of the fish?—Yes, I think it would; I have no doubt it would.

2946. Then supposing all the trawlers were put down you think you could get as many fish as you do now?—Yes, I think so.

2947. I suppose you wish to see the trawlers put down?—No, I never wished them to be put down. We only want them to be clear of our coast. If they want to trawl, and they are fond of it in the South, why don't they trawl off their own coast? We don't want them here. We don't want to be bothered with them. Their nets catch our hooks and lines, and do us great injury.

2948. But if you could make sure that they would not destroy your lines and bratt nets, would you object to them?—Yes, we don't want them here at all. They have been here all the summer, and I should say that in consequence of their being here I have not lost less, during the last four years, than from 300*l.* to 400*l.*

2949. That is a great hardship, no doubt, but supposing it were possible to establish any kind of police regulations by which you could prevent the trawlers from taking your nets and your long-lines, would you have any objection to their trawling on this coast?—Yes, I should. My own opinion is that they cannot trawl without interfering with our lines and nets.

2950. But surely if they were fishing 15 miles out at sea they would hardly interfere with you?—Yes, they might. We go all that distance to fish ourselves.

2951. Would the same objection apply if they were confined to fishing off the Dogger Bank?—No, they would not do us any harm there, and I believe they have been trawling there.

2952. Do they trawl now?—Yes, I believe so, and they would not do us any harm if they confined their trawling to the Dogger Bank. They can trawl along there as long as they like for all I care about it.

2953. Then I understand from what you say that if the trawlers kept off your ground so as not to destroy your property, you would not care about them?—I don't know that. We don't want them on this coast at all.

2954. Do you think the operations of the trawlers have had a tendency to cheapen the price of fish in the market?—They may have done so. They have been so cheap, some of the fish, that they have been given away. They have sent an enormous quantity of stuff into the market which has not been fit to sell.

2955. Have you ever been undersold by them?—Yes, I think we have occasionally. We might have got a higher price for our fish if they had not been here, and in addition to that I think we should have caught more fish.

2956. Is that one of the grounds why you don't like them?—Yes, but perhaps you will let me explain. The fish we catch is good fish. Our fish is very different from theirs. It is a very different article indeed from what they take in their trawl nets.

2957. But I want to know if you think that the fish thrown into the market by the trawlers has had a tendency to lower the price of fish generally, so that you get less for your fish in consequence of theirs competing with yours?—I don't know whether that is the case or not. The price has been much higher of late years than it used to be. We used to have fish a good deal cheaper when there was plenty of it. I have sold haddocks at 1*s.* a score, and at the Ferry-boat landing here I have sold cod at 2*d.* apiece.

2958. Then you do not believe that you would get more for your fish if the trawlers were all put down?—No, but we should get very much more fish in quantity in the course of a few years.

2959. Have you ever had your attention called to the articles of the Convention between England and France with regard to the fisheries? There is a particular article in the law to which I should like to call your attention. Have you seen a great many trawlers fishing about here?—I have seen as many as 15 trawlers here in the course of a day.

2960. Do you know whether these trawlers carry any particular coloured vanes at their mast heads?—Yes, I think I have noticed one or two of them with a bit of small vane up.

2961. Were they red or blue?—The vanes I have seen have been blue.

2962. Have you ever heard of this article: "For "the purpose of distinguishing by day drift-net "fishing boats from trawl-boats, both shall carry "at the mast-head vanes which shall be at least "eight inches in height and two feet in length. "The colours of these vanes shall be, for British "trawl-boats, red; French trawl-boats, blue. British "drift-boats, white and red; French drift-boats, "white and blue." Did you ever hear of that before?—No, I think not.

2963. You see that one of the articles of the Convention is that the British trawl-boats shall carry a red vane. You say that you never saw a vane of that description used?—No, I never did.

2964. Do you think that trawling and line-fishing can go on together; is there room for you in the same water?—No, I think not.

2965. Then you are of opinion that one must go to the wall?—Yes, one must go to the wall, and we, being the weakest, are that one. If they knock us down we know where we must go to.

2966. And where is that?—Why, to 'Davy Jones's locker', I suppose.

2967. If the trawler destroys your nets, or your hooks and lines, I presume you know that he is open to the law?—Yes, but when they have destroyed our nets and lines, and we have sought protection, we have found it impossible to get any magistrate here to assist us in bringing the law into operation. Their belief is that there is no law in existence upon which they can act.

2968. But allow me to tell you that there is a very definite law. You stated just now that the trawler who destroyed your lines was not numbered?—No, he was not.

2969. Are you not aware that there is a very definite law upon that point?—I believe that all trawl-boats ought to be numbered.

SUNDERLAND.

J. Purvis.

28 Sept. 1863.

2970. The 14th article of the Convention says: "The name of each fishing boat, and that of the port "to which she belongs, shall be painted in white oil "colour on a black ground, on the stern of the said "boat, in letters which shall be at least 3 inches in "height, and half an inch in breadth." Did you ever hear of that article before?—Oh yes, I know that the number should be painted.

2971. And article 15 says: "It is forbidden to "efface, cover, or conceal, in any manner whatsoever, "the letters, numbers, and names placed on the boats, "and on their sails." Article 8 says: "The letters "and numbers shall be placed on each bow of the "boat, 3 or 4 inches below the gunnel, and they shall "be painted in white oil colour on a black ground. "For boats of 15 tons burthen and upwards the "dimensions of these letters and numbers shall be 18 "inches in height, and $2\frac{1}{2}$ inches in breadth. For boats "of less than 15 tons burthen the dimensions shall be "10 inches in height, and $1\frac{3}{4}$ inches in breadth. The "same letters and numbers shall also be painted on "each side of the main sail of the boat, in black oil "colour on white sails, and in white oil colour on "tanned or black sail. These letters and numbers on "the sails shall be one-third larger, in every way, than "those placed on the bows of the boat." Now do you mean to say that the trawlers have not got these numbers?—There have been two or three of them down here this summer that had no number.

2972. Is that the habit and practice of the trawlers off this coast?—No; some of them were numbered, but there certainly were two or three which had no numbers at all.

2973. As I understand you, your opinion is that no kind of police regulation would be of any practical service to you, but that the trawlers must be kept away from your fishing ground altogether?—Yes, that is my opinion.

2974. I understood you to say just now, that there were holes in which the lobsters are caught?—No; you misunderstood me then.

2975. Do you mean that there are holes in the rocks where the lobsters, in coarse weather, go for shelter?—Yes.

2976. In what depth of water?—In five, six, or seven fathoms, and from that to three fathoms, and from that to close to the shore.

2977. You do not catch the lobsters in these holes, but you set traps for them; is that so?—Yes.

2978. Did I understand you to say that persons were in the habit of discharging ballast on the places where these holes are?—Yes.

2979. And that when they discharge it out at sea the sea drifts it in?—Yes, and causes it to fill up the holes.

2980. Just so. Have you ever seen herrings here in January and February?—I have never been catching them in January or February, but I have in November and December.

2981. In what condition were they then; were they full?—Yes.

2982. Were they full of spawn?—Yes.

2983. They were what you call 'full fish'?—Yes, pretty full.

2984. Do you often see the 'appearance' of herrings in January and February?—Not very regularly, but sometimes we do. At this time of the year you frequently see them.

2985. In your herring nets, how many meshes have you to the yard?—About 32 to the yard.

2986. Do they never run to 35 or 40?—No.

2987. Why don't they?—Because we should catch herrings that would be much too small, and I believe there is an Act of Parliament against it.

2988. You have heard of that?—Yes.

2989. Does anybody come to see that your herring nets are of the right size?—No.

2990. Then do you have them of that size because you don't care to have them smaller?—Yes, we don't think it would do us any good to have them smaller.

2991. But whether you have the meshes big or small, nobody is the wiser in the matter?—No, nobody but ourselves.

2992. I understood you to say that the French interfere a good deal with your herring fishery?—Yes.

2993. How do they interfere with you?—They sometimes shoot as many as 50 or 60 nets in a night. We only shoot 12, 14, or 16 nets. The consequence is that they can overshoot us. It often happens that when we have them shot the French fisherman will come and shoot his nets close to ours. Now ours are only supported by bladders, but the French nets are made of thick rope, and have kegs attached to them. The consequence is that if they come over our nets they destroy them, and we have to haul in and get out of the Frenchman's way, or else we should lose one-half our nets. If our boats ever come into collision with the French boats we have no choice in the matter, but are obliged to get out of the way as soon as possible.

2994. If you were to shoot your nets in the midst of a shoal of herrings—I mean you Sunderland fishermen—and a Frenchman happened to be near you, would he come and shoot his nets among you?—Yes, he has shot right across us many a time.

2995. But are you not aware that that is against the law?—Yes, I know that.

2996. Then why are they allowed to do so?—Why they do it because they are never interfered with. They never come to the land. They never come to any harm by it.

2997. The French boats are numbered, are they not?—Yes.

2998. Very well. Then if a Frenchman shoots his nets across yours in that illegal way, why do you not take his number, and summon him?—That would be extremely difficult. For instance, upon a dark night he may be two miles away from us and still his nets will be foul of ours. Of course in such a case as that we cannot take his number.

2999. What is the size of your boat?—It is about 23 feet long.

3000. You call it a 'coble', do you not?—Yes.

3001. And you say that you cannot leave your nets?—No.

3002. Do the gunboats ever come among you?—We have occasionally had some of our gunboats here, but for the last two years I have not seen an English gunboat among us.

3003. Do you ever hear of a man-of-war's boat rowing guard amongst you?—No, never; but one night I saw a boat from one of the French steamboats amongst us. He brought-to close inside of us.

3004. Did the French officer interfere at all with the fishermen?—Yes, he hauled some of them up and moored them aside Hartley. He made them anchor there till daylight, and then took them to Shields.

3005. Was that done by way of punishment?—Yes, and I believe they were subsequently fined.

3006. Did you ever know any of our cruisers do that?—No.

3007. Then the only instance in which you recollect the English boats being protected on this coast was by a French cruiser?—Yes, that is all.

3008. Do the French ever come and fish inside the limits, three miles from the shore here?—Yes, many a time. I have frequently seen them only one mile from the shore.

3009. Does anyone interfere with them to prevent them from fishing within the limits?—No, unless it is their own boat which is up there among them,—the frigate.

3010. Then I understand you to say that you have had no efficient protection from the gunboats here?—No.

3011. What kind of protection do you think would be sufficient for this part of the coast?—I think it would take a gunboat or two.

3012. But you would not like a gunboat coming among your nets, would you?—If they were to keep clear of us it would not do us any harm.

3013. Your nets stretch for 10 or 12 miles, do they

SUNDERLAND.

J. Purvis.

28 Sept. 1863.

not?—Yes, but they are so thick generally that a boat would not like to come among them; it would keep away for its own sake.

3014. But if the gunboat was at one end while you were fishing, and the French fishermen were among you at the other end, who is to help you then?—Why nobody.

3015. If a man-of-war's boat were to pull among you would that hurt your nets?—No, they could be there very well on a fine night, but of course it would be impossible for them to afford us much protection in coarse weather.

3016. Surely a man-of-war's boat would keep the sea as well as yours?—Yes, their cutters would.

3017. I presume that wherever a herring boat would live, a man-of-war's boat would live also?—Yes.

3018. Then would that afford you the protection you desire?—Yes, to some extent.

3019. Are you aware that it is illegal to shoot your nets before half an hour before sunset?—I am aware that it is an evil.

3020. I am not speaking of it as an evil; but I want to ascertain from you whether you are not aware that it is illegal to do so. Are you aware that there is any law against doing it?—I was not aware of it until you told me so. I have heard that it was the law formerly that nets should not be shot before sunset, but that has not been followed out. I was not aware that it was the law now.

3021. Well, then, you may take it from me that it is the law. Article 87 says:—"It is forbidden to "herring drift-net fishing boats to shoot their nets "earlier in the day than half-an-hour before sunset, "except in places where it is customary to carry on "this drift-net fishing by daylight"?—But it has never been the custom to carry on drift-net fishing by daylight.

3022. The fish do not rise until night?—No.

3023. Do you think it would be right to enforce that article which I have read to you?—Yes, I think it would be quite right.

3024. Do you think that the fishermen here would like it?—Yes.

3025. Can you tell me what harm is done in consequence of shooting the nets before sunset?—Yes; perhaps there may be a shoal of fish off the coast, and there would probably be 200, or 300, or 500 boats ready to shoot their nets. If they shoot them too early the fish will fly away; they will not bide there. They swim up to the surface of the water about sunset, and they will fly away if they can see the nets being shot among them.

3026. Do they fly away in a body?—Perhaps, not always; sometimes a shoal may be broken.

3027. In that case some would go one way and some another?—Yes.

3028. Have you ever seen a shoal dispersed in that way?—Yes.

3029. Can you tell me when?—Yes, I have known it occur this season.

3030. Who were shooting their nets at the time?—All the boats were shooting their nets that could get round the shoal.

3031. Then you were all breaking the law together?—Yes, all of us.

3032. Do the French fishermen fish on any nights on which you do not. For instance, do they fish upon the Sunday?—I cannot say whether they fish upon the Sunday, but they fish on the Sunday night; that I know.

3033. And do you not fish then?—No.

3034. What time of the year does the turbot-fishing begin?—In April.

3035. And what time of the year does it end?—At the latter end of August.

3036. Why do you not go in to fish for turbot after August?—We might fish later than that if we could get a sale for the fish; but the fish very frequently turn much thinner at that time of the year.

3037. What time do they spawn?—I cannot say. When the herrings come on to the water we give over using our turbot nets. We are obliged to bring them ashore or sink them, or the herrings would take the buoys away.

3038. Then does the beginning of the herring-fishing put an end to the turbot-fishing?—Yes, it will do so, unless we take the buoys off our nets, or unless the herrings get off further in the sea. Sometimes they get into 30 or 40 fathoms of water before they come near the shore, and there are some men here who never go to the herring fishery at all during the season.

3039. (*Mr. Caird.*) Have you any harbours to which you can run in bad weather?—We are not very well situated when we have a dark night and no lights. We have a good harbour if we can only get to it; but having no lights, on a dark night it is sometimes difficult.

3040. Then if there were lights, do you think you could run in in safety?—I think that lights would be very useful to us. We have nothing but the lights of Sunderland to guide us. Very frequently we find it impossible to get in. We are very often bothered when we have an easterly wind and a good sea.

3041. Then it is not the want of a harbour you complain of, but the want of a harbour properly lighted?—Yes, and we ought to have some regulation to make it better than it is. It wants a good light to improve it.

3042. Is there a quay at your place to which you can run up at low water?—No, we have no quay; it is a dry harbour. If you saw it at low water, you would scarcely think it was a harbour at all.

3043. Then you cannot run in at low water?—Yes, we can, but we have to run to the south side of the rocks.

3044. Then you can run in at low water?—Yes, but it is an awkward place, and we are apt to injure our boats. If we could get up to the entrance here we could come in.

The witness withdrew.

WILLIAM HUTCHINSON called and examined.

W. Hutchinson.

3045. (*Mr. Caird.*) Are you a fisherman?—Yes, at Whitburn.

3046. At the same place as the last witness?—Yes.

3047. Have you been there long?—I have lived there about 45 years.

3048. Does your experience agree very much with what the last witness has stated?—Yes.

3049. Do you find that the catch of fish has decreased?—Yes.

3050. And has that decrease taken place within recent years?—Yes.

3051. What kind of fish has specially decreased?—Almost all kinds that we catch.

3052. Has the cod decreased as much as the herring?—Yes.

3053. Has the quality or size of the fish decreased as well as the quantity caught?—There is not so much complaint to make as to size, but they have very much decreased in number.

3054. Are the haddocks as good as they used to be?—Well, I don't see much difference that way.

3055. With regard to the shell-fish, do you find that they are decreasing?—Yes, there is a great deal of decrease in them.

3056. And what do you suppose is the cause of that?—Well, I think it is because so much ballast is thrown into the water. I think that is one great reason.

3057. Is there anything that is injurious to the life of the fish in the ballast that is thrown over?—No; but it washes into the holes and blocks them up.

3058. Is there anything injurious in it?—Well, I think there is a great deal of poisonous stuff taken

SUNDERLAND.

W. Hutchinson.

28 Sept. 1863.

from Shields Harbour, from the factories, and that is all thrown over.

3059. As well as the ballast?—Yes.

3060. Don't you think that is also injurious to the fish?—Yes, I think it must be.

3061. Do you object to the ballast being put into the sea at all?—Yes, I do.

3062. Does your experience with regard to the herring fishery agree with that of the last witness? Do you think that it has diminished?—Yes.

3063. To what do you attribute the diminution of white fish—I am speaking of white fish now, and not of herrings?—I think it is owing to so much spawn being taken away by the trawl-smacks.

3064. Are you aware of that of your own knowledge?—Yes.

3065. Have you ever seen the trawlers fishing?—No.

3066. Then how do you know?—I have heard others say so who have been in them.

3067. But you cannot speak from any personal knowledge of your own?—No.

3068. When did you first find that an injury was taking place?—About four or five years ago.

3069. Not before four or five years back?—Well, it had occurred slightly before that, but not so much as lately.

3070. Is it four or five years since the trawlers made their appearance upon your coast?—There had been one or two before, but not so many as within the last four or five years.

3071. Has the diminution of fish gone on in the same proportion as the increase in the number of trawl boats?—Yes, I think so.

3072. Have you noticed that particularly?—Yes.

3073. What do you suppose has injured the herring fishing?—Well, there are a great many smacks fishing together, and they must take a good deal of spawn. That I think must be very injurious. We have heard from some of the smack men that they have taken as much as three tons of spawn in a haul.

3074. But what has injured the herring fishing?—I cannot say.

3075. I understood you to say that you do not get such good catches now as you used to get?—No.

3076. Do you think that there are not as many herrings on the coast as there used to be?—No, I don't think there are.

3077. Does anybody interfere with you here when you are fishing for herring?—Yes, the French trouble us sore.

3078. Do they take any large proportion of the fish caught off this coast?—Sometimes they get their cargoes badly, but sometimes they get them very quick.

3079. Can you give me any idea what proportion of the herrings caught on your shore are taken away by the French fishing boats?—No, I cannot say.

3080. Do the French fishing boats fish within the three-mile limit?—Yes, frequently.

3081. Then do they pay no regard to the law upon that point?—Not the slightest.

3082. Do they follow the fish wherever they go?—Yes, wherever the fish are, there they shoot their nets.

3083. Do you agree with the previous witness that our gunboats afford you no protection?—Yes, I quite agree with him. They give us very little protection here.

3084. They don't come in among you?—I believe they do sometimes, but we very seldom see them.

3085. What I mean is, do they come among your boats and give you any aid and protection against the French fishing boats?—No.

3086. Would it be a matter of much importance to you if they did?—Yes, I think the French ought to be kept out where they are allowed to fish, and not be allowed to come amongst us.

3087. Then do you think that if the French were kept out beyond the three-mile limit it would be of advantage to you?—Yes, it would be of very great advantage to us.

3088. Is there any wasteful mode of fishing adopted by you here at all?—I don't think there is.

3089. You do not bring up any spawn or destroy it?—No, never.

3090. Do you trawl for soles here?—Very seldom.

3091. When you do, do you ever get spawn?—No; we trawl near the shore where no spawn would lie.

3092. Do you agree with the previous witness as to the advantage of having some regulation with regard to the time of shooting your herring nets?—Yes, I think it would be of very great advantage.

3093. What sort of regulation do you think ought to be established?—I think no nets ought to be allowed to be put into the sea before half an hour before sunset.

3094. And if such a regulation could be strictly enforced upon all the fishermen you think it would be of advantage?—Yes.

3095. Is there any other regulation that you would like to see enforced?—Yes.

3096. What?—I would not allow any fishing to be carried on on the Saturday night or the Sunday night.

3097. You think there should be two days in the week on which there should be no herring-fishing?—Yes, I think that would be much better for us. It would enable the fish to get together.

3098. Why would it be better for you?—It would be much better for those who have to buy the fish, and those who have to catch them.

3099. But can you give us any reason?—Sometimes we catch so much that they become a drug for the day, and settle the market during the whole of the week. Many a time the trawlers will catch fish on the Saturday and sell them for 14*s.* or 15*s.* per 1,000, while they have been selling them for as much more the day before. For instance, the price may have been 25*s.* or 30*s.* per 1,000 on the Saturday, and that might regulate the price for the whole week if it were not for the steps taken by the trawlers.

3100. (*Professor Huxley.*) Do you agree with the last witness as to the injury done to your nets by the heavier tackle of the French boats?—Yes.

3101. Do you know of any other injury having been done by them in addition to destroying your tackle?—No.

3102. Have you heard of any injury having been done in consequence of anything having been thrown overboard by the French fishermen?—No.

3103. You never heard of such a thing?—No.

3104. Did you hear me read some of the regulations contained in the Act of Parliament?—Yes.

3105. Had you ever heard of them before?—No.

3106. How long have you been a fisherman?—All my life; for the last 45 years.

3107. Do you think it would be of any advantage to you if some of these regulations were enforced?—Yes, I think it would be of advantage.

3108. Do you happen to know when the turbot spawn?—No, I don't know that.

3109. You heard what the last witness stated as to the method of catching turbot?—Yes.

3110. Do you agree with that?—Yes.

3111. You state that turbot get into meshes like the herring?—Yes.

3112. Do you think that as much fish can be caught by the long-line fishermen as is caught now, supposing that there were no other mode of fishing practised?—Well, we always did catch plenty to supply the market before the trawlers came, and we could sell it for a deal less money and make a deal better living out of it.

3113. When was the diminution in the supply of fish first observed?—It has begun to fall off within the last few years.

3114. How many years?—Three or four years.

3115. Not more than that?—No.

The witness withdrew.

DAVID ARCHBOLD called and examined.

3116. (*Mr. Caird.*) Are you a fisherman here?—Yes, I have been three years here the 16th of this month.

3117. Where is the station from which you fish?—I am a fisherman of Craster.

3118. Where is that?—Between Coquet Island and the Fern Islands.

3119. But you do not fish in this neighbourhood?—Yes, I have been here for more than three years past.

3120. You have been here at Sunderland?—Yes.

3121. Have you heard the evidence which has been given by the previous witnesses?—Yes.

3122. Do you agree generally with what they have stated?—Yes, I agree with them on most points.

3123. What is it that you do not agree with them in?—I cannot call to recollection now, but if you will ask me questions I will answer as well as I can.

3124. Does your experience enable you to say whether the catch of white fish and of herrings has diminished of late years?—Yes, it has diminished very greatly since I came here.

3125. Within the last three years?—Yes.

3126. What fish in particular has decreased?—Haddock, cod, ling, skate, and flat-fish.

3127. Can you tell us what an average catch would be?—When I first came I was in the habit of catching 50 or 60 stone. Some days we might not catch more than 20 or 25 stone; all days, you know, are not alike, but the catch is according to the season of the year.

3128. You are speaking now of three years ago?—Yes, the first year I came here.

3129. What is the average catch now?—I do not think I ever got more than 25 stone throughout the whole of last winter.

3130. What do you think was the cause of that decline?—In my opinion it is entirely owing to the trawl-fishing.

3131. Do you refer particularly to the trawlers that come off your shore here?—I don't refer to any particular trawlers, but I think the injury has arisen from the mode they have of fishing. You have perhaps some idea of what a trawl net is like.

3132. Yes?—They trawl all over the ground, and if there happens to be any spawn upon it or any small fish they destroy it and take it up entirely.

3133. Have you ever seen the trawlers do that?—I have frequently bought from them for bait small fish not fit to be eaten.

3134. Have you ever seen the trawl lifted?—No, I never did.

3135. What was the size of the fish you bought for bait?—I had a small bushel basket, such as is used for onions, and I had between 7 and 8 score of fish in it; I counted them myself.

3136. Of what size were the fish?—They were very small indeed; some of them were only the size of that inkstand (*pointing to one*). The fish were so small that a great portion of them were not taken to the shore at all, but left on the deck of the boat.

3137. Then did you buy the fish at sea?—Yes, they were not presented upon the shore at all as the other fish are.

3138. Do you think that if the trawlers were confined to the Dogger Bank, or more distant parts, they would do you any damage?—I cannot say that. There is a great deal of spawn laid off there for breeding, and of course it would injure that if any trawling was to take place when the spawn was there. If the spawn is destroyed, you know we cannot have any fish.

3139. Then you think that the mode of fishing by using the trawl net will injure you wherever it is practised?—Yes, it is my opinion that it will injure any part where it is practised.

3140. With regard to the quantity of herrings caught here, have you noticed any diminution of late years?—Yes, and I can give you a proof of that. This time two years I made 250*l.* by the herring fishery, and last year I only made 180*l.*

3141. Do you mean that you made that with one boat?—Yes.

3142. What have you made this season?—This season I have made 70*l.* or 80*l.*, and I have been a fortnight later fishing. I think that is a very good proof that the fish here are not so plentiful as they used to be.

3143. What was the price of the fish you caught two years ago; was it the same as it has been this season?—I cannot exactly answer that question. I had been down on the north coast fishing, and the price of fish was hardly ruled by the catch. The merchants take the fish as a matter of speculation. If they lose one year they cannot afford to give the same price for the herrings the next.

3144. But you say that you got 250*l.* in one year and only 80*l.* this year. How is that?—That was owing to the greater catch.

3145. Was it solely in consequence of having caught more fish?—Yes.

3146. And the price of the herring remained the same?—Yes. I took two or three different shots, and I got upwards of 40 barrels, 700 fish in each barrel. This season now past I think the greatest catch I had has been 22 barrels; 12,000 fish was the next best catch I had.

3147. Then is it your opinion that the shoals of herring have fallen off?—Yes, they have fallen off very greatly.

3148. Have the French fishermen been on the coast before?—Yes, they have been here ever since I was a boy.

3149. Then, notwithstanding the fact that the French have been here fishing, you have had good catches while they were on the coast?—Yes.

3150. Do they come within the three-mile limit?—Yes, they came wherever the fish were. We had the same gunboats that we had before, but we had different captains in them. Last year we had a captain who used to come in the fore part of the night, before any boats shot their nets at all, and he made a practice of driving all the French boats beyond their limit.

3151. That was last year, was it?—Yes.

3152. And it was the year before that that you made your great catch of fish?—Yes; but I made a very good catch last year also.

3153. And I understand that you had good protection then?—Yes. With regard to the season, I may say that I only came from Yorkshire on Saturday morning, and during the whole of the season I have only seen a gunboat once on the coast, and then it was in the middle of the day.

3154. Then do you think that the protection you have had from the gunboats has been a great benefit to you?—Yes.

3155. Have you caught more herrings in consequence of the protection given to you by the gunboats?—Undoubtedly.

3156. Then if you had had the gunboats here this year, do you think you would have made better fishing?—Yes, I am certain of it. There are plenty of fish here, but the difficulty is where to put your nets. We desire to put our nets where the fish are, but theirs are in also, and as we cannot drive with them on account of their nets being larger and stronger, we are obliged to fish outside. One night we shot our nets, when they came to us and shot beside us. One of the biggest luggers came foul of my nets and tore them, and when we went alongside of her they covered the number of the boat so that we could not see it.

3157. What did they cover it with?—A tarpaulin.

3158. Then they must have seen that they were destroying your nets?—Yes, they saw that plain enough.

3159. Then if there had been a gunboat on the station would that have protected you?—Yes; I could then have given information, and the gunboat would have gone at once and taken his number; but we had no place to apply to, and by the time we had

SUNDERLAND.

D. Archbold.

28 Sept. 1863.

hauled our nets in the French boat had gone away and left us. My brother was alongside of me at the time with the same quantity of nets, and the same sized boat. His nets were not interfered with, and he got 38 barrels of fish while we only got 22.

3160. Then I gather from what you have stated that you do not come to the conclusion that there is the same falling off in the supply of herrings that there is in the supply of white fish. You seem to be of opinion that there is the same quantity of herrings, but there are not the same opportunities for catching them?—The herring-fishing is nothing like the white-fishing at all. The white-fishing we look to as a general thing. Some seasons the herrings put in here in large numbers, and some seasons there are comparatively none at all. Sometimes the herrings set in in stormy weather when we cannot catch them, we cannot get after the fish then at all. But the white fish is a certain case of fishing. They are always on the ground at certain seasons, and what we object to is the interference we have to put up with. If these larger boats get in fishing before us we have no opportunity of catching fish at all.

3161. (*Professor Huxley.*) Did you ever hear of any other injury being done to you by the French fishermen?—Yes.

3162. In what way?—In gutting the herrings. They gut the herrings when they want to cure them for salt-fish. They haul their nets in then, and some of the vessels bring up on the ground. As fast as they get the guts out they heave them overboard, and, so far as my calculation goes, that does a great deal of harm among the live fish.

3163. Why do you think so?—It must fall down among them if they are there, and must make them shift their quarters.

3164. Do you think that it is merely the throwing of the offal on the fishing ground that makes the fish move away?—Yes, that is our opinion on our coast.

3165. Do you think that the herrings are frightened by the offal being thrown among them?—Undoubtedly.

3166. Is there any other cause that may account for the dispersion of the herring?—Yes; I think that they are frightened frequently in consequence of putting the nets overboard too soon. I have seen that done very frequently. I have seen 400 or 500 boats—French boats, Yorkshire boats, and even Penzance boats, and others, all shooting their nets at the same time, and yet they would not get a fish. Even if the fish were there we should be obliged to go outside. Sometimes they break the shoal in two, and entirely divide them. They separate. Part take one side, and part will take the other.

3167. Are you aware that that is against the law?—Yes, I am very well aware of that.

3168. Then if anyone had given information they would have been fined, would they not?—It would have taken some time to fine us all.

3169. Still that is the state of the law?—Yes; I have done it myself, and there is no use in saying I have not. Everybody does it when he has the opportunity. If he thinks the fish are there he will shoot among them.

3170. If a gunboat had been upon the coast would it not have looked after you?—I have seen the nets shot at improper times even when the gunboat was there.

3171. You heard what I read just now about decked and undecked boats, did you not: The 29th article says that: "Whenever decked herring boats "and undecked herring boats shall commence shooting "their nets at the same time, the undecked boats "shall shoot their nets to windward of the decked "boats, except they should prefer going to leeward, "to a distance of at least half-a-mile, to shoot their "nets"?—Yes, I know that very well.

3172. Do you think that that regulation has been enforced?—No; not to my knowledge.

3173. Do you think it would be of any service to you if it were enforced?—Well, all good laws should, I think, be put in force.

3174. That is not exactly the point. Is that a good law? Do you think it would be of use to you to put it in force?—What do you refer to.

3175. The law I speak of is this: "Whenever "decked herring boats and undecked herring boats "shall commence shooting their nets at the same time "the undecked boats shall shoot their nets to wind-"ward of the decked boats, except they should prefer "going to leeward, to a distance of at least half-a-mile, "to shoot their nets." On the other hand, the next article says: "The decked boats on their part shall "shoot their nets to leeward of the undecked boats, "unless they prefer going to windward, to a distance "of at least half-a-mile, to shoot their nets." Do you think that these regulations ought to be put in force?—Yes, I think they ought to be.

3176. Do you think it would be a good law to put in force?—Yes, if it were properly put in force, and we had sufficient protection to insure its being carried out.

3177. Do you think that would prevent the heavy-tackled French boats from over shooting you?—Yes, it would keep them a certain distance from us, so that they would not be able to meddle with us.

3178. Do you think it would be beneficial to put that law in force?—Yes, I do.

3179. All that the law compels the French boat or any decked boat to do is to go half-a-mile outside or inside of you?—Yes, I perfectly understand.

3180. Now suppose the undecked boats have shot among a shoal of herrings and the heavy decked boats, whether French or English, go half-a-mile outside of you, which is all they are obliged to do by this law, and suppose they then shoot their nets, do you think that the distance of half-a-mile will prevent their running amongst you?—Yes, I think it is quite enough, we don't want all the sea to ourselves.

3181. You think they would never catch you?—No.

3182. Now we have been informed in the course of this inquiry that the heavy boats and the boats with heavy buoys would drift down with the wind faster than light boats?—Yes, but if they were to the leeward they would go away from us.

3183. But you observe that these articles enable a boat to shoot to windward also?—Then in that case it would depend, perhaps he might get amongst us.

3184. If he were to leeward he would get away?—Yes.

3185. But if he were to windward would he not drift upon you?—He might do so. But we object to his coming upon the ground at all. What we object to is this—that he should come upon the ground and take a berth before we have the opportunity of doing so.

3186. Now suppose you have a moderate breeze and he shoots to windward of you, would he not foul your nets?—Perhaps he might. I think it ought to be a mile instead of half-a-mile.

3187. And the law will not protect you in that case?—We don't want all our own way. Other people want bread as well as we do.

3188. But the law says this, that supposing decked boats are upon the ground already, and have shot their nets, then if the undecked boats come they are either to go to leeward or to windward. I will read you the article; it says, "When decked boats shall arrive "on ground where fishing is already begun by other "boats, amongst which shall be undecked boats, the "decked boats so arriving shall shoot their nets to "leeward of undecked boats, except they should "prefer going to windward, to a distance of at least "half-a-mile to shoot their nets.' What do you think of that regulation?—We shoot wherever the fish are; we are obliged to go among them. It would be of no use to us to be obliged to be outside. What I understand from what you have read is, that the law as it stands at the present moment, if enforced, would be just as likely to do us harm as good.

3189. Quite so, because the French keep to sea always, and having the first chance of shooting their

nets if you go and try to get fish after they have cast their nets you are then obliged to shoot half-a-mile either inside or outside of them?—I do not see how that would work; but if they were prevented from shooting their nets before half-an-hour before sunset, we could shoot as soon as they. The evil now is that as soon as they see us come out they weigh their anchor and shoot all their nets together, so that when we get to where the fish are we are unable to get amongst them at all.

3190. Then if the sunset regulation were enforced so that all could start fair, it would give you a sufficient protection; is that your opinion?—Yes. if there was anybody to enforce the law.

3191. Then I understand that if you all start fair, by having these sunset regulations, the other regulation would be sufficient to keep the French from meddling with you?—Yes; that is my opinion.

3192. I believe that you heard the questions which I put to the last witness as to the mode of protecting the fisheries?—Yes.

3193. You heard what was said about the gunboats and rowboats, and so forth. What do you think of them?—I think they are hardly sufficient. A vessel cannot always be where she wants to be, and a gunboat would be very useful at times to tow the fishing boats down and set them at the fisheries. That would be much better than having only a sailing vessel. A sailing vessel cannot always be there, and the protection we want is that there should be a Government vessel always on the ground to see that the Frenchmen shoot outside the limits. Now they have only been once on this coast this season to my knowledge, and then they were off Dunstanborough Castle.

3194. Do you think it would afford sufficient protection in carrying out these regulations that there should be a gunboat stationed here, and a man-of-war's boat to row guard?—Yes, I think so.

3195. You think that would be sufficient?—Yes.

3196. Do you think the three-mile limit is far enough?—No, I would give them 20 if I had my way. That is plenty nigh enough; they do so much injury to our gear. Two years ago they took 22 nets of my brother's aboard; they took them to Berwick, and they were quite destroyed. It cost my brother 60*l.* or 70*l.* to make them good, and all that he got for his nets and expenses and everything else was 10*l.*

3197. Supposing all these regulations were carried out thoroughly and that you had a sufficient police protection, so that you could punish a man for interfering with you, then do you think that the three-mile limit would be enough?—Yes; provided that the Frenchmen when they broke the law got the punishment they deserved. But to fine a Frenchman 3*l.* for coming within the limits is only like the snuff of a candle. He may be taken to Berwick and fined 3*l.*, but he cares nothing at all for that. If a man summons him, he has in the first place to find out his number, and he loses all his time and fishing as well, so that as a general rule it is not worth his while to take any steps at all. Many a time we should take these boats before the proper authorities, but we don't care to meddle with them, because we know we shall be losing our time and our money.

3198. Then you do not think that the penalties imposed are sufficient?—No, certainly not.

3199. What would you suggest?—Why I think they ought to be taken into the harbour and kept there during the remainder of the herring fishery.

3200. But the law as it stands at present seems to give a magistrate the power of doing something of that kind, I think. It says, "All persons shall be condemned "to a fine of from 8*s.* to 5*l.* sterling, or to imprisonment "from 5 to 15 days, who either by night or by day, "conjointly or separately, shall offend against the measures established for the preservation of peace and "good order." You see from that that the magistrates would appear to have the power at present of imprisoning all parties who infringe the law for a period of from five to 15 days. Do you think that is sufficient?—All I can say is that that has never been done, to my knowledge.

3201. Has the offending party always been let off with a fine?—Yes.

3202. But suppose that a man was sentenced to imprisonment, do you think that would have a good effect?—Yes; but if they would take the boat into the harbour and not let it out again for the rest of the season, I think it would do a great deal more good.

3203. If these regulations were carried out strictly, and the penalty was imprisonment instead of a fine, do you think that would be sufficient?—Yes, but if we could get a six-mile limit instead of three miles, I think it would be much better. Three miles is no distance from the land at all. Most of the fish lie above three miles from the shore. If we had a six-mile limit instead of a three-mile limit, it would be much better for us. If that could be done I think it would be of very great advantage.

3204. (*Mr. Caird.*) Do any other boats interfere with your herring-fishing except the French?—Sometimes we have what we call the 'half-and-halfers'; they shoot among us sometimes, but they do not do us much harm.

3205. Are they English boats from other parts of the coasts?—Yes; their tackle is heavier than ours; that is the only way they could do us damage; but there are not many of them. I have not seen more than 18 or 20 all this season.

3206. How do they injure you?—They are rigged up the same as the French, and they have casks instead of bladders for buoys. They are much heavier boats, and if they get among our tackle they do us considerable damage.

3207. They are heavier boats and have heavier gear?—Yes; and they drift as fast as a French fishing boat.

3208. Do you suffer much injury from the English boats in that way?—No, not much. Not near so much as from the French.

3209. Do you object to their coming among you?—I object to all decked boats coming among open boats. No open boat can drift with a decked boat.

3210. Are they all decked boats?—Yes.

3211. And you object that decked boats should be allowed to come among undecked boats at all?—Yes.

3212. Do you think that any alteration could be made in the regulations whereby the two might be enabled to fish together without injury?—I think not, unless they were obliged to have their gear like ours.

3213. How is it that you have never thought of trying decked boats yourselves?—Why, a poor man cannot afford to get a decked boat, and we can get a small one when we cannot get a big one. There are plenty of men engaged in fishing who can get a small boat but who would find it altogether impossible to get a large one.

The witness withdrew.

CHARLES VINCENT called and examined.

C. Vincent.

3214. (*Mr. Caird.*) You are a fisherman here?—Yes, I am fishing from this town at present.

3215. What kind of fishing do you follow?—The beam-trawl fishing.

3216. Have you been long engaged in that kind of fishing?—Yes; for the last 26 years.

3217. Have you been fishing from this town?—No, I come from Torbay.

3218. When did you come upon this coast?—About eight weeks ago.

3219. Is that the first time you were here?—It is the first time I was ever here.

3220. Then you are a Torbay fisherman?—Yes; but we are like the wandering Jews; we are all over the world, sir.

3221. How many years have you been engaged in

SUNDERLAND.

C. Vincent.

28 Sept. 1863.

trawl-fishing?—26 years altogether. I served an apprenticeship of nine years to it first.

3222. Have you ever been as far north as this before?—Yes, and further; I have been at the Firth of Forth.

3223. Trawling off this coast?—Yes.

3224. What is the ground upon which you generally trawl?—I have been as far as the Firth of Forth but it was in a pleasure yacht. I never went there in my own smacks. I have fished generally between here and Coquet Light.

3225. What induced you to come as far as this?—We fancy we catch better fish here for a few months than we can at other places.

3226. But are there no fish off your own shore?—Yes.

3227. But you catch more here than there?—Yes, and we like to get into harbour on the Sundays; we therefore fish off this port so that we can get in on Sunday, and go out again on the Monday morning.

3228. But cannot you do that upon your own coast?—Yes, if we liked.

3229. Then, how is it more handy here in that respect?—We can get into the port we belong to very well, but we cannot get in when fishing off the coast at Hull. We are generally engaged for six or eight weeks upon that ground, and don't go to port at all.

3230. How far off do you trawl from your own coast?—Perhaps 100 miles; perhaps 60 or 70; it will be according to the season of the year.

3231. In the course of your experience in trawling on this coast, do you find that you get fewer fish than you used to do?—No; I think that we have been increasing very much instead of diminishing.

3232. When did you begin to come north here?—About eight weeks ago.

3233. In what year was it that you began to leave your own ground and come further north?—Do you mean the Torbay ground?

3234. Yes.—About two years ago.

3235. Do you not fish at Torbay at all now?—No, not at present. I reside at Hull; that is my residence.

3236. Do you find one season more favourable for fishing than another, and would the same state of seasons be also applicable to Torbay?—I don't find much difference; there is a good living to be got at Torbay as well as here, but of the two perhaps this is rather the best.

3237. When did you discover that?—During this summer.

3238. Then, did you find that you were more successful in fishing with the trawl off here than at Torbay?—Yes.

3239. Do you catch the same kind of fish here?—Very much the same; we don't get herring there.

3240. When do you draw up your trawl?—At all hours of the day, from Monday morning until Saturday night.

3241. How long is it down?—It is sometimes down for six or eight hours.

3242. At what speed is it dragged along the ground?—Two and a half or three miles an hour; it all depends upon the wind.

3243. When you bring up your trawl, have you any means of ascertaining whether it is time to haul it up, or do you do it by chance?—We haul it up to see. We allow a tide; that is, about six hours between putting down the trawl and taking it up again. I consider that that is the time at which any fisherman should see his nets. It is necessary also for fear that you catch too many fish.

3244. Too many fish in the trawl?—Yes.

3245. When you got the trawl aboard, have you ever observed whether there was spawn in it?—No.

3246. You have never observed spawn in your nets?—No.

3247. Have you never seen such a thing?—No. I have been 26 years fishing, and I never observed such a thing, unless we got fish that had spawn in its belly.

3248. What is the size of the small fish that you get in the trawl?—Some of them are as long as your finger, and some as broad as your hand.

3249. Is there any large proportion of the fish you get small fish?—Perhaps we may catch a gallon or a basketfull of small fish; we may get two or three basketsfull in three trawls.

3250. Are they living or dead when you bring them up?—They are generally dead, but there may be a few living.

3251. What do you do with them?—It is generally the privilege of the boy on board to bring them on shore, and make a shilling or two out of them for spending money for himself.

3252. Then, you do not throw them into the sea?—Sometimes we do.

3253. What weight do you get in the trawl net in a draw?—I have caught as much as two tons in a draw.

3254. What proportion of that would be small fish unfitted for the market?—At times there might be a few hundredweight; sometimes we will not have one at all.

3255. In what state are the fish when you bring them up in the trawl?—They are generally living, but there may be a few dead ones amongst them.

3256. Are many of them much damaged by the action of the trawl?—No, none at all.

3257. What do you chiefly catch?—Turbot, soles, flat-fish, hake, haddock, and all kinds of fish.

3258. Do you catch codfish?—Yes, codfish, ling, halibut, and every kind of fish.

3259. Do the cod look as well as if they were caught by the line?—Yes, equally as well.

3260. Are they not in any way damaged or injured?—No, not at all.

3261. Are they mostly living and good marketable fish?—They are quite living when we are bringing them on deck, but they are not very long before they are dead; we see them jumping about the deck after we have taken them in the trawl.

3262. What do you do with them when you get them on deck?—We pack them up.

3263. Have you a well on board?—No.

3264. How often do you come ashore?—Every morning when we can get ashore.

3265. During what months do you follow this business?—All the year round; we are continually at it.

3266. Do you shift your ground?—Yes; if we cannot get fish here we go further south, and if there are none there we go further still. We should go right on until we found them.

3267. Have you ever disturbed the long-lines or turbot nets of the fishermen?—I never did so myself, that I am aware of.

3268. Did you ever go through their fishing ground?—I don't know what they call their fishing ground.

3269. Did you ever go among their long-lines?—No.

3270. Do you sometimes get among their boats?—Yes, we get among them sometimes, and we see them shoot their long-lines.

3271. But you don't get foul of their lines or nets?—I don't doubt but some smacks will get foul of them sometimes; of course they will. It can't be avoided when we can't see them.

3272. What is the value of a trawl-boat?—They are of different sizes. Some would be worth about 900*l.* and some 700*l.*; perhaps 700*l.* would be about the average price.

3273. Is that for a vessel fitted with a trawl?—Yes, all ready for sea.

3274. I understand you to say, that your experience of fishing extends over 25 years?—26 years.

3275. Do you find that the catch of fish by your trawl-boat is increasing or diminishing?—Do I find it what?

3276. Do you find it increasing or diminishing?—It is increasing. I remember when I went trawling first, if we made 7*l.* or 8*l.* a week we considered it

a very good wage. My master was always pleased if we made 8*l.* Now we are not satisfied if we don't make 15*l.* or 20*l.* Certainly there are a great deal more catchers of fish, and the fish themselves are more plentiful than they used to be.

3277. Is there not a great difference in the price of fish compared with what it was 25 years ago?—Yes.

3278. Is there not as great a difference as there is between the 7*l.* or 8*l.* you used to get, and the 15*l.* or 20*l.* you get now?—No; we catch far more; fish were scarce in my younger days. I have been in the habit of making 5*s.* or 6*s.* by a pair of soles, but now we only make 1*s.*, 6*d.*, or 8*d.*

3279. Do you get soles in your trawl nets?—Yes.

3280. Do you get a large proportion of soles?—Yes. I never heard of soles being caught on lines in my life.

3281. Have you observed, in your experience, whether the size of the fish is as large as it used to be?—I don't see any difference in that respect. There are big and small now, and there used to be big and small formerly.

3282. Then there is no marked difference?—There has been no great alteration during the last 25 years?—Not a bit; the fish are continually breeding and they spawn as they used to do formerly.

3283. Has the number of trawl-boats increased much in recent years?—Yes, it has increased very much.

3284. Speaking of Torbay, how many boats were there there 25 years ago?—There were about 50 sail when I first went to sea; now they have scattered about all over the country. There are some of them at Ireland, some here, some at Hull; but I should say there are about 300 at Torbay itself.

3285. You go now much further about than you used to do for fish?—Yes; very much further. I fancy that if we went to Brixham we might make 10*l.* or so; but at Sunderland I think we could get 25*l.*, and we are all of us covetous; therefore we come here. As there is no use in starving ourselves we travel about.

3286. Has the size of your boats during that time increased or diminished?—They are a good deal larger now.

3287. Is the size of the nets you use the same?—Yes; much the same.

3288. Then there has been no change in your mode of fishing?—None.

3289. Except that the vessels you use are larger boats?—Yes.

3290. What is the advantage of the larger vessels?—26 or 30 years ago they used to be about 36 or 38 tons register; now they are about 48 or 50 tons.

3291. Are your nets any larger in proportion?—They may be a little larger, but not much.

3292. What advantage is there in having larger boats?—We get them to go through the weather better.

3293. Do you mean that you can keep more at sea?—Yes; we have more to encounter in this part than we have at Torbay; large boats are far more safe.

3294. Is it your custom, when fishing, to make for the nearest port in order to sell your fish?—Not in general. In a month's time we may go in and out of Hull; but we don't run for a port directly we have got a take of fish.

3295. If you were fishing off here and got a good catch of fish, would you not run in and sell it?—We should not run in that night; probably we might the next morning.

3296. Do you make for here?—Yes; some of us may go into Newcastle.

3297. Whatever part of the coast you are on do you make for the nearest port where you can get a sale?—Yes; if we are close at hand.

3298. Do you take the harbour that you consider most convenient?—Yes; if we think we can sell our fish.

3299. (*Professor Huxley.*) Have you any vane at the mast-head of your boat?—We have all got vanes.

3300. Are your vanes painted in any particular way?—Yes; mine is red.

3301. Why is it red?—Because I bought it red.

3302. Then you have it only because it was your fancy to have it so?—Yes.

3303. Do you know that there is any reason why it should be a red vane?—Yes; because it is according to law, I believe.

3304. Did you know the law before you heard me read it now?—Yes.

3305. How long is your beam?—44 feet long.

3306. Do you think that that is legal?—No. I know it is not legal; but many things are done that are not legal.

3307. Is there anybody to meddle with you whether you have a long beam or a short one?—No.

3308. There is nobody to meddle with you?—No, nobody comes to meddle with us in beam-trawling.

3309. What is the size of the mesh of your net?—It is about 6 inches, and from that down to 3 and to $3\frac{1}{2}$.

3310. Is the beam attached to your net the same size as it always was, or is it longer?—It is longer; it used to be 40 feet.

3311. Do you know that that is against the law?—Yes, I believe 36 feet is the proper length.

3312. No, 38 feet?—Well, somewhere about that.

3313. Do you have any nets outside the meshes of your trawl net in order to make these meshes a little smaller?—No.

3314. What is the weight of the head-irons of your trawl net?—From about 250 lbs. to 300 lbs.; they are of different sizes.

3315. Do you know of any law why you should not have them more than a certain weight; did you ever hear of this?—"The total weight of the two irons or head-pieces of a trawl shall not exceed 287 lbs.?"—That is rather more than $2\frac{1}{2}$ hundredweight.

3315a. Do you load the ground-rope of your trawl?—Yes.

3316. What with?—I twist a rope round it.

3317. Do you use any lead?—No.

3318. No iron chains?—No; only ground-rope.

3319. Then you don't weight it at all?—Yes, it makes it a little bit heavier.

3320. But you don't put any lead upon it?—No.

3321. Do you know of any reason why you may not put on as much lead upon the rope as you like?—We find we can do without it, and we don't want to have the expense of putting it on.

3322. At the same time you don't know why you should not use more than a certain quantity?—No.

3323. In fact there is nobody to make you acquainted with the law?—No.

3324. I suppose you are not much given to law-reading?—No, we get on very comfortably without having anything to do with law.

3325. What price have you been in the habit of getting for trawled fish?—We get different prices; it all depends upon the quantity caught.

3326. But I want to know particularly whether you get as much money for your trawled fish as the hook-and-line fishermen get for theirs?—I think there is very little difference; we compete with one another.

3327. Do you sell your fish cheaper than the hook-and-line men?—No, we try to get all we can for our fish.

3328. Do you think you can always have the same price in the market as the hook-and-line fishermen?—Yes; we are very well satisfied with what we get.

3329. Do you ever have a part of a cargo of fish rejected on account of its being damaged?—We do sometimes find our fish damaged on account of contrary winds which prevent us getting into market, and they are then condemned.

3330. You mean that they are condemned because they are not fresh; because they have been kept too long?—Yes.

SUNDERLAND.

C. Vincent.

28 Sept. 1863.

3331. Do you not adopt the system of despatch-boats?—Yes; we have them with ice, but not here.

3332. I believe that one remains constantly in attendance upon the trawl-boats?—Yes.

3333. Why is that not done here?—We don't require it here, we can go in every morning.

3334. Then I am to understand that if you kept out at sea any time your fish would get stale?—Yes, of course it would.

3335. Is any portion of it rejected because it is injured or bruised?—No, I never had such a thing happen to me.

3336. Are the scales on the fish?—They are more or less on the fish; sometimes they are all off.

3337. Do you ever have fish rejected because the scales are off?—No, never.

3338. Did you ever have them rejected because the gall bladder had burst?—No, I never saw the gall bladder burst.

3339. You never saw such a thing?—No.

3340. Do you think that if they liked to do so, the trawlers could get out of the way of the lines of the long-line fishermen?—Yes, if they put up proper lights we could avoid getting foul of them.

3341. Are there no buoys attached to the long-lines?—Yes.

3342. Are they so large that you can generally see them?—No, they are somewhat small; they have small bladders upon them generally.

3343. The buoys you have seen have been commonly bladders?—Yes.

3344. How large would they be?—I suppose they were what you would call bullock's bladders; rather large-sized bladders.

3345. Have you seen a kind of buoy that stands out of the water with a little tuft at the top?—Yes.

3346. Are buoys of that nature sufficiently large to attract the attention of trawlers?—We can see them by day, but of course we cannot see them by night. We trawl according to the breeze.

3347. You cannot do much in steering if you have got the trawl down?—I fancy we could generally get a little out of the way, but not much. The vessel generally steers herself.

3348. Do you take a long time to get the smack's head round when the trawl is down?—No, only about half-a-minute.

3349. Is it perfectly easy for you to get out of the way if you wanted to do so?—Yes, I think so.

3350. If the buoys were large enough, and you could see them, you think the trawlers ought to do no damage at all?—I think not.

3351. Are your boats all numbered?—Yes. There may be one or two that have just been fitted up which have not had time to have their numbers put on.

3352. Who looks after the numbering of the boats?—There are officers on shore, I believe.

3353. Do you mean the Custom House officers?—Yes.

3354. If you are found without having your boat numbered are you allowed to go out of the docks without having it numbered?—No.

3355. Is there anything done if your number is obliterated or not visible?—We are threatened that if we don't number our vessels we shall be stopped.

3356. Do you ever get any stones in your trawl net?—Sometimes.

3357. What size is the biggest you have seen?—We have had them occasionally as large as a ton and a half.

3358. A good catch that?—Not very good on the part of the catchers.

3359. Do you ever trawl over ground where there are stones as big as that?—Yes, we do sometimes.

3360. Don't you avoid ground with stones like that if you can?—Yes, but we can't help it sometimes. I am speaking now of the ground down south at Torbay.

3361. You would not trawl in such a place if you knew it?—No.

3362. What is the ground you commonly do not trawl over?—Where the long-line fishing goes on.

3363. What kind of ground is that?—Well, I have seen long-liners close in shore in 26 fathoms with rough stony ground.

3364. Is that the kind of ground you don't like to trawl over?—Yes.

3365. Are you aware that it is the law that you are not to trawl where the herring and mackerel-fishing is going on?—No.

3366. One of the articles in the Act of Parliament says: "Trawl-fishing is forbidden in all places where "there are boats engaged in herring or mackerel drift-"net fishing." The next article says: "Trawl-boats "shall always keep at a distance of at least three "miles from all boats fishing for herring or mackerel "with drift-nets." Did you know anything of that before?—No.

3367. Article 26 says: "Whenever herring or "mackerel boats shall commence drift-net fishing "in any place whatever the trawl-boats which may be "already fishing in such place shall depart therefrom "and shall keep at a distance of at least three miles "from the said drift-net herring or mackerel boats." Have you ever heard of that before?—No.

3368. Nobody has enforced that law?—No.

3369. Then if the drift-net men went out from here and told you trawlers to get out of the way would you do so?—Yes, I think we should as fast as we could.

3370. Why?—Because if we remained we should annoy ourselves as well as them.

3371. In what way?—Why, we should soon get entangled with them.

3372. But you did not know it was the law you should get out of the way?—No, I never heard of it.

3373. If you got among them would you not say it was their own fault, and tell them to get out of the way?—No, we should haul our trawl up and go away.

3374. But you did not know it was the law that you should do so?—No, but we should do so for our own benefit.

3375. But how should you like to be obliged to do so if the long-line fishermen came among you?—If we had our trawl put down first they would not come among us.

3376. If they did would it not interfere with your trawling?—There is plenty of long-line fishing going on but they don't interfere with us.

3377. But they complain that you interfere with them?—We don't like to get entangled with them if we can help it.

3378. Would you object to any law that would compel you to go away from wherever there was long-line fishing going on?—No, I think not at all.

3379. Then do you think there is plenty of room for the long-line fishing as well as the trawling?—Yes. If the long-line fishermen would not shoot unless within 10 or 15 miles of the shore we could go into 50 fathoms water if we choose.

3380. You say you get more fish here than at Torbay?—Yes.

3381. What is the reason?—At certain times of the year a great deal more fish is brought up here than at Torbay.

3382. Has that always been going on, or is it taking place now particularly?—No, I think it has always been going on.

3383. Do you trawl over the same ground day after day?—Yes, we do so here.

3384. How long have you been trawling this season?—About eight weeks.

3385. Have you trawled over the same ground day after day?—Yes.

3386. What length of ground do you trawl over?—Sometimes 14 or 15 miles.

3387. About what breadth of ground do you trawl?—It would be the breadth of the beam.

3388. But I mean, how much ground will you be covering day after day?—We go over about 44 feet of ground in breadth.

3389. Do you go over one ground one day, and

SUNDERLAND.

C. Vincent.

28 Sept. 1833.

a different ground the next?—No; if we have got a good lot of fish in one place we like to put our nets in the same place again.

3390. Would a mile be about the breadth of ground you fish over?—Yes; a mile or two.

3391. Then, if I say that you fish over ground 18 miles long by two broad, would that be it?—Yes; but it would all depend upon the wind.

3392. Do you fish every day?—Yes, except Sundays.

3393. You have been fishing here for the last eight weeks?—Yes.

3394. Has your catch been greater or lesser during the latter part of the time than at first?—I fancy that we find more now than we did eight weeks ago.

3395. Then you are certain that you get just as many fish as you did eight weeks ago?—Yes.

3396. On this narrow fishing ground of 18 miles long by two broad?—Yes.

3397. Do the long-line fishermen fish there?—I believe they do shoot there sometimes.

3398. Do you ever bring their long-lines up in the trawl?—No.

3399. I understood you to say that you never get spawn up in your trawl net?—No; but I should like these men to say what it is they call spawn.

3400. I suppose you have seen herring caught when they are full?—Yes.

3401. Then, when the herring are full, have you not seen the fish packed together and spawn coming out of the female fish?—Yes, sometimes.

3402. Have you never seen any spawn like that brought up in your trawl?—No; I fancy it would be a most inconsistent thing if a small thing like a pin's head should not pass through our mesh if we did catch it.

3403. But the herring spawn keeps together in great masses, does it not?—Yes.

3404. I have seen a mass of herring spawn larger than that box upon the table?—Yes; but I never saw herring spawn in a trawl, nor do I believe that any man who went trawling ever did.

3405. The beam of your net is kept off the ground by head-irons, is it not?—Yes.

3406. It would be about two feet from the ground?—Yes.

3407. Do you ever trawl fast enough to lift the beam off the ground at all?—We don't if we can help it; but I think we do it sometimes.

3408. You never load your foot rope?—No.

3409. Not with irons or leads?—No.

3410. What do you cover it with old stuff for?—It makes it heavier and saves the rope.

3411. But you put nothing heavier than rope around it?—No.

3412. How is it you contrive to get hold of the large stones?—We do catch them sometimes, and drag them, but we don't want them, and soon put them away when we get them.

3413. If you were dragging along at the rate of two or three knots an hour, your nets would not go over the ground but would lift, would they not?—We could not go at that speed through the water. We give them a long rope according to the wind, and if we have 150 fathoms and a heavy breeze we will have it well out.

3414. But you think the foot rope always keeps fairly on the ground, although it is not weighted?—Yes.

3415. Is there any difference between the price of trawled and hooked whiting?—I have heard that hooked whiting will make more money.

3416. Have you found that yourself in the market?—Yes, a little at times, but there cannot be much difference between hooked and trawled whiting. They are all of one sort, but I fancy that perhaps the hooked whiting looks a little better to the eye.

3417. (*Mr. Caird.*) How many men are there on board a trawl-boat?—Five men.

3418. Is that sufficient?—Yes.

3419. When you bring the trawl up does it not often contain stones?—No, not often.

3420 Are there any stones in it at all?—Yes, sometimes there are.

3421. Do not the stones you catch injure the fish?—We don't catch enough to do that; I don't think they injure the fish.

3422. But surely if you brought up very large stones they would injure the fish, would they not?—If we catch a large one the fish may be squeezed a bit, but if they are much injured we should not bring them ashore at all.

3423. Do you ever get any coals in your trawl net?—We catch a few sometimes.

3424. Do they do any injury to the fish?—No.

3425. Do you bring them up in large quantities?—We may bring up half a hundred weight in six or seven hours dragging.

3426. You don't do that in Torbay?—No, in no place except here.

The witness withdrew.

JOHN CLEMENTS called and examined.

J. Clements.

3427. (*Mr. Caird.*) Are you a trawl-fisherman?—Yes.

3428. What part of the coast do you hail from?—Hull.

3429. Are you in the same boat with the last witness?—No.

3430. How long have you been engaged in trawl-fishing?—32 years.

3431. During these 32 years where have you particularly followed trawl-fishing?—I have been 15 years at Hull, but I have been down here at Sunderland for 10 summers now.

3432. Did you trawl on the coast of Yorkshire opposite Hull?—Yes.

3433. Then you have now extended your fishing further north?—It is only in the summer time we come down here. We do it because we think we can earn 1*s.* or 2*s.* extra.

3434. Did you leave Hull in consequence of any falling off in the quantity of fish you caught?—No, there was plenty of fish, but it was to get a better market that we came here. We came here because we knew we could bring the fish into market good.

3435. How was that?—When we were at Hull we had frequently to send the fish by cutters, and if we could not get ice sufficient to keep the fish fresh they became stale. We thought it better to come here and land our fish every morning.

3436. Could you not land your fish fresh at Hull every morning?—No, we might be 30 miles off.

3437. You are nearer port here?—Yes.

3438. That is one reason why you came here?—Yes.

3439. You did not leave Hull because there was a diminished number of fish?—No, I believe there are more there than there are here.

3440. Have you ever found any spawn in your trawl nets?—No. I have seen plenty of spawn on the water's edge, but I have never seen it in the trawl.

3441. You never brought it up from the bottom?—Not to my knowledge. I never took any notice of our having done so, and if what we have brought up is spawn then I don't know what spawn is.

3442. What do you find comes up in your nets?—Why all sorts of fish—soles, gurnets, turbots, brill, dabs, and every kind almost you could mention.

3443. What is the smallest fish you catch?—Gurnets and dabs.

3444. How many are they in quantity compared with the whole of the fishing?—Well, I have brought ashore two baskets of small fish.

SUNDERLAND.

J. Clements.

28 Sept. 1863.

3445. Do you ever throw them overboard?—When we can't get them in fresh we chuck them away.

3446. Have you found in your experience, which extends over so long a time, that the quantity of fish you catch is increasing or diminishing?—It is 10 summers since first I came here and then we could get about 10 baskets ashore in a morning.

3447. What sorts of fish?—Haddocks, plaice, and perhaps 20 pair of soles. Now we can bring ashore, sometimes, 70 pair of soles.

3448. Then you have found that there has been an increase in your take of fish instead of a diminution?—Yes.

3449. You have told us that you have been here 10 summers, was anybody here trawling before you came?—No.

3450. And during all that time there has been a steady increase?—Yes.

3451. Do you notice any change in the size of the fish you get, on the average?—No, they are much about the same.

3452. Then it is not your opinion that trawling has diminished the quantity of fish?—No, I think it has increased it, because the foot-rope is constantly stirring up the bottom and supplying the fish by that means with food. The fish will be behind picking up the food as we stir it up.

3453. What is the food?—Worms of all sorts and slugs. I know very well that when we have been trawling over the same ground for any length of time the guts we have thrown overboard have been swallowed by the fish.

3454. Do you not think that you disturb the spawn?—No.

3455. Have you never seen it inside the fish? Have you never found that it has been swallowed?—Yes, I have sometimes seen it off Well Bank, but only there.

3456. You have never found it on this coast?—No, but I have found fish off Well Bank very often full of herring spawn.

3457. Of herring spawn?—Yes.

3458. Do you agree with the former witness that the quality of the fish you catch by the trawl is as good as the quality you get by the line?—At times they are a little bit disfigured, but when they are landed in that way we sell them at a somewhat cheaper rate.

3459. Is there any large proportion of your catch disfigured?—No, not very large. Sometimes we have a few that are a little bit smashed; some of them we heave overboard, and others we sell at different prices.

3460. How many of your catch do you think would be injured?—I cannot say.

3461. Would one-half of your catch be injured?—No.

3462. Would one-fourth?—No.

3463. Would one-tenth?—No. This morning we had our nets up, and there were only two or three haddocks spoiled out of 17 basketfuls.

3464. Two or three haddocks out of 17 basketfuls?—Yes, each basketful containing about seven stones.

3465. When you took your 17 baskets to market did you find them bring as much money as fish caught with the long-line?—No.

3466. Not your good fish?—No.

3467. Why is that?—Because we catch more of them, and we are obliged to retail them off quicker and cheaper.

3468. Then it is not because they are inferior in quality?—No. There are people in the town who have enjoyed what they never did since we came here—that is, plenty of fish, and cheap fish too.

3469. Do you think the quantity you bring in affects the price of the fish?—Yes.

3470. Do you know whether you have added much to the supply of fish in this market as trawl-fishers?—We have added very greatly to the supply, I am sure.

3471. Can you tell me from your own experience what you would have considered, 20 years ago, a good day's fishing in a trawl-boat?—Well, I can hardly give you a day's fishing 20 years ago. We generally go month by month.

3472. Then what would be a month's fishing?—We generally allowed 40*l.* or 45*l.*, or 50*l.* at the outside. We should consider that a good month's fishing.

3473. Fifty pounds?—Yes.

3474. What is your experience now of the value of a month's fishing?—I think it would bring us from 80*l.* to 120*l.*

3475. Has not the price of fish very much increased within recent years as compared with what it was in former times?—I don't think it has increased much, but we have a great deal more fish and more vessels to catch them. We have bigger vessels and go farther a-field for the fish. Small vessels dare not go as far as we go. We go to the Dogger Bank and outside the Dogger Bank, and God knows where we don't go.

3476. Then do you find that you can make more than you did 20 years ago?—Yes.

3477. That is by the increased quantity of fish you take, and not by any increase in the price of the fish?—Yes.

3478. Do you fish on the Dogger Bank?—Yes, sometimes we go there.

3479. Do you find any fish inside, between the Dogger and the coast?—Yes, there is a pit we call the 'Silver Pit', and we get a good many fish there.

3480. Do you find that fishing in-shore is as profitable as going to the Dogger Bank?—At certain times of the year it is, and we fish in-shore then.

3481. In point of fact you follow the fish?—Where they go we go.

3482. What time of the year do you consider it best for fishing on the Dogger?—The winter time.

3483. Is summer time the best for in-shore fishing?—Yes.

3484. What is the cause of the difference?—There are more fish in the summer time go in-shore and we can get them into the market fresh, and get more money for them.

3485. Do you ever interfere in fishing along the coast with the line-fishers' nets and lines?—I have seen them interfered with at times, but I never had any experience of it. I never interfered with any of them. At the same time it is often difficult to avoid them because we don't know where they lie. I have seen a small bladder, but I hardly knew what it was until I found it was a buoy.

3486. Did you not get foul of the nets in that case?—No, that was on the rough ground where we dare not go.

3487. If you had passed among them you would have injured them, would you not?—Yes.

3488. Have you ever observed a buoy like that (*pointing to one on the table*) at sea?—No. I may have seen one like that on a long-line, but never on a turbot net. I never came foul of any man who had a long-line.

3489. Has any fisherman ever complained that you have destroyed his line?—No, not that I have heard of.

3490. What is the length of the beam of your trawl?—Forty feet.

3491. Is it longer than it was in former years?—Yes, a little.

3492. Have you increased the length and size of your trawl-beam?—Yes, it formerly used to be 35 or 36 feet. The vessels we used then were smaller, and could not have stowed away a larger beam.

3493. Are you not aware that there is a restriction as to the length and size of your trawl-beam?—I believe there is, but nobody has ever interfered with us.

3494. Nobody ever interfered with you?—A gunboat told us once that the beam ought to be 38 feet long, but he went away again, and we took no more notice of him. He took away one of the trawls, but returned it to us again.

3495. Can you tell whether you are constantly passing over the same ground by the smoothness of the ground?—Yes.

3496. If you clear off any roughness, and bring up stones at the bottom, can you tell again when you are passing over the same spot?—Yes.

3497. If on that ground you were to lose anything overboard would the trawl pick it up?—Perhaps it might.

3498. Do you find that you get as many fish when passing over the same ground?—Yes, quite as many.

3499. How do you know that it is the same ground?—We tell generally by the depth of the water; the water so soon deepens that we know directly.

3500. (*Professor Huxley.*) Can you make out where you are by your bearings?—Yes.

3501. Do you take a compass with you?—Yes.

3502. Have you a mariner's compass on board?—No.

3503. What then?—Only a common compass. By our lead and our compass we are enabled to go within a few fathoms of water.

3504. Do you go by a chart or by knowing the country?—Only by knowing the country.

3505. I understand you to say you have found herring spawn in the haddock?—Yes.

3506. Did you ever find it in flat-fish?—No.

3507. Have you any notion where the herring spawn?—No.

3508. But when you get herring spawn in a haddock you suppose the haddock got it on the ground you were trawling over?—Yes. If they had not been on the ground we should not have caught them.

3509. Then if the haddock contrive to get some herring spawn your trawl ought to get some, ought it not?—No, our foot rope would pass over it. The herring spawn lies very flat and we would not pick it up unless it might be a piece the size of your fist or a little bigger.

3510. But the herring spawn is in great masses at the bottom, is it not?—I never saw it in that state. Perhaps I may be allowed to say that we catch a deal of sand.

3511. Do you mean in your trawl?—Yes, it soaks in.

3512. When you stop to heave the trawl in it goes in at once?—Yes.

3513. But does not the sand pass through the meshes?—Yes, by the time we get the trawl up it is all gone.

3514. The sand cannot get in when you have got any way on you?—No, directly we weigh the sand runs through, and when we get the net to the water's edge it is all gone.

3515. Do you suppose that the sand is mixed up with the fish?—No.

3516. You heard the question I put to the last witness, namely, whether he would object to a restriction keeping the trawlers away from the long-line fishermen?—Yes.

3517. Do you agree with him?—We try as much as possible to get away from them because if we get entangled with them it hinders us of our night's work. We have no desire to get foul of them at all.

3518. The last witness said he would just as soon as not have a law passed preventing you going within three miles of the long-line fishermen?—I never was foul of any herring nets in my life, and I have now been a fisherman for 32 years.

3519. I am talking about long-line fishermen. Would you have any objection to have a law passed preventing you from going within three miles of the long-line fishermen?—I can hardly say.

3520. I mean within three miles of any place where long-lines are shot?—Three miles is a long way, and at the time they might happen to be fishing on that ground we should have to go out where could get no soles at all.

3521. Do you think that such a restriction as that would prevent your getting any fish at all?—It would prevent our getting any soles.

3522. Would it prevent your getting any other kind of fish?—I fancy we should get the haddocks but we should lose the soles.

3523. Are haddocks so plentiful that you get them wherever you trawl for them?—The further off we are the more haddocks we get. It is just the other way with soles.

3524. Do you catch turbot?—Very rarely. I have only had one this winter.

3525. Do you catch halibut?—I have only had two of them.

3526. Do you get many codfish?—Yes, plenty of cod.

3527. Is it common to catch many cod?—Yes, I have had 108 in one haul.

3528. Where was that?—Off Flamborough Head; 30 miles off.

3529. Is it common to catch them?—Sometimes. We had five or six large cod this morning.

3530. You heard the regulations I read with regard to the trawlers?—Yes.

3531. Did you know anything of them before?—No, I never heard of them before.

3532. The Custom House authorities see to the numbering of your boats?—Yes.

3533. But they don't trouble themselves about anything else?—No.

3534. Have you ever had the size of your net's meshes examined?—Yes.

3535. By whom?—By a gunboat here.

3536. Did you ever know a trawl-boat that carried nets with meshes of an improper size?—Yes, sometimes.

3537. Did you ever know any notice of it taken by the authorities?—Yes. I believe a neighbour of mine at Sunderland lost his nets once but it was owing to a mistake of the government officer's. They thought the mesh should be $1\frac{3}{4}$ inches from knot to knot.

3538. The Act of Parliament says—"Trawls shall be made with nets the meshes of which shall at least be one inch and three quarters square from knot to knot along the line." You see the officers of the gunboat were quite right?—It should be 7 inches in the square then.

3539. Yes, 7 inches square. You stated that the commander of the gunboat measured the net and took it away because the mesh was not large enough?—Yes. He measured ours at the same time and said it was right.

3540. But he seized the other?—Yes.

3541. What became of it?—He took it to the Custom House and then returned it to the right owner at Hull. Both vessels belonged to one owner, who went to Captain Randolph of the "Cornwallis," who interceded for him, and the net came back again all right.

3542. There was no penalty enforced?—No punishment, but I believe the captain of the boat was fined.

3543. He was fined?—I will not be sure.

3544. (*Mr. Caird.*) To whom are you referring—the captain of which boat?—Of the smack.

3545. (*Professor Huxley.*) Has there been anyone here this season to examine your trawl-boats?—No, there has been no one here this season. I believe there was no one here last season. I think it will be two years since there was any one here. I have been here 12 years altogether and they have only missed two years.

3546. Have your nets only been examined once in the course of these 12 years?—Only once.

3547. That is all?—Yes.

3548. One of the witnesses stated that if he trawled more than a certain time, and his trawl remained down more than a certain time, he would lose by it?—Yes, if he allows it to remain down longer than six hours he will get a great deal more fish than he could heave up. The consequence would be that he would burst his net and lose it.

3549. Are the fish more damaged the longer you leave the nets in?—Yes, the shorter the haul the better the fish.

3550. Do you ever heave a trawl up and find no fish injured at all?—Yes, we have had them just as lively as if they were caught on a hook-line. Scores of them we have had in that way.

SUNDERLAND.

J. Clements.

28 Sept. 1863.

3551. Does that happen when you have a good haul?—Yes, it is better then, frequently, than at any other time.

3552. Do any of the fish, when they come up, appear marked with the trawl?—Yes, perhaps one or two or so which we heave overboard again.

3553. There is no large proportion marked?—No, sometimes we may stamp on one or two and damage them ourselves.

3554. Do you ever have any fish rejected by the dealers on account of their being damaged?—Never in my life. I never had any damaged by the net and if they have been damaged at all it has been by their being kept too long.

3555. Did you ever know of trawl-fish being damaged or rendered unsaleable in consequence of having the gall bladder burst?—No, never in my life.

3556. Did you ever see the gall bladder burst?—Yes.

3557. How has it been done?—Sometimes we may have cut the gall bladder when we were gutting the fish, but we always wash them clean, so that if the gall burst the fish would soon be quite clean.

3558. You don't gut your fish on your trawl-boat, do you?—Yes, we do it directly we have caught them. We don't do that off here because we can take the fish into market quite fresh, but we are obliged to do that when we send the fish in by cutters. We don't know when they will get to market, and we are obliged to gut them.

3559. But you don't do that here?—No, because they come here ashore all in their bloom just as they are caught.

3560. Supposing any large proportion of the fish had the gall bladder burst, would you bring them ashore like the rest?—I cannot tell.

3561. I want to know whether when you do not bring the fish ashore but gut them on board, you have had occasion to reject any of them and throw them overboard on account of the gall bladder having been burst?—No, never in my life.

3562. You never found that the gall bladder had been burst?—No.

3563. You never had fish rejected on that ground?—No.

3564. Did you ever see fish spoiled in consequence of the gall bladder being burst?—If the fish is kept very long. There may come a gale of wind and we should be compelled to put them down in the hold. On opening the hold next morning I have sometimes found the gall bladder burst, and we put them overboard.

3565. Did you ever eat fish that had the gall bladder burst?—No.

3566. Then you can't say if it gives any particular taste to it?—No.

The witness withdrew.

H. Meldrum.

HENRY MELDRUM called and examined.

3567. (*Mr. Caird.*) Do you belong to this place?—Yes.

3568. Are you a trawl-fisher?—No, but I have been for a short time in a trawler, for a week or two.

3569. Was that on this coast?—Yes.

3570. What time was it?—Some time last summer.

3571. Where did the trawl-boat come from that you were on board?—Hull.

3572. Were you a hand on board the boat?—Yes.

3573. How long were you on board?—About a fortnight.

3574. Did you in particular observe what came to the surface in the trawl net?—Yes, decidedly.

3575. What have you seen brought up in the trawl net?—Well, I have seen a good deal of spawn, small fish, and large fish likewise.

3576. Was spawn generally in the trawl net when it was brought to the surface?—Yes, it was all in the trawl net; both mud and sand and all sorts of fish mixed up together.

3577. Was there much spawn?—There might be a basketful.

3578. Did you always find spawn in the net when it was brought up?—Yes.

3579. Every day?—Every time it was brought up.

3580. You say that there were always many small fish in the net?—Yes, a great quantity.

3581. What proportion of fish altogether would be brought up in the trawl net at one haul?—As much would come up in the net at one time as one of our boats would catch in the whole season.

3582. How much would you say?—Perhaps a ton of spawn, large fish, and small fish.

3583. Have you been present when the fish were sorted?—I was the man who had to sort them.

3584. How many basketfuls would be good fish?—Perhaps there would be 14 or 15 good baskets, and 14 or 15 bad baskets.

3585. Then it would just be about half and half?—Yes.

3586. Was that the case constantly?—Yes.

3587. Did it never vary?—No; it never varied, not one inch.

3588. What was done with the small fish?—They were all tossed overboard.

3589. Were none of them brought ashore?—Three or four baskets might be. This (*producing a bundle of fish*) was what was brought ashore. This is what they call 'small fish', and this is some of the largest of the small kind.

3590. When were they caught?—Yesterday.

3591. Were they brought to market?—Yes.

3592. Is that about the size you refer to when you speak of small fish?—These are about the biggest of the small fish brought to market.

3593. Are the small fish generally dead when they are brought up?—Yes, the whole of them.

3594. Then there could be no advantage in putting them back into the sea?—No, it would be no good.

3595. Did you observe that the marketable fish were at all injured by being dragged along in the trawl?—Yes, they were sorely injured.

3596. Was a large proportion injured?—Yes.

3597. How many were living when they came to the surface?—Not one; I never saw a live fish come up in the trawl.

3598. What kind of fish are generally caught in the trawl?—All sorts; cod, ling, turbot, and skate. We have sometimes thousands of skate not the size of the first joint of your finger.

3599. They are always dead when they are brought up?—Yes.

3600. How many trawls have you seen brought to the surface? How many times have you seen it hove up?—Perhaps three or four dozen of times; it might be six dozen; I can't tell to a time or two.

3601. Yet you never saw a live fish come to the surface in the trawl?—No, none of any sort.

3602. What else would be in the trawl besides fish?—There would be coals, stones, mud, and all sorts of fish. The codfish has to be washed, and put in baskets, and packed up.

3603. What proportion of the fish you caught were good fish?—Perhaps half of it.

3604. Then half of it would be injured?—Yes, half would be condemned and thrown overboard.

3605. Are you speaking of small fish?—Yes, both small and large. Half the complement that comes up is mangled to pieces by being dragged over the ground.

3606. Have you seen the large fish mangled?—No, none whatsoever; it is generally the small fish that are mangled.

3607. Are the large fish in good order for the market?—Yes, pretty fair.

3608. (*Professor Huxley.*) What do you mean by large fish and small fish?—Why, there is a great deal

of difference between one of these fish (*pointing to the bundle*) and a cod.

3609. What is the smallest of the large fish; do you call an ordinary-sized sole a large fish?—No, a small one.

3610. Are all soles that are brought up damaged?—No, that is a fish that is not so easily damaged.

3611. Are they all of them damaged and unfit for market?—No; I never saw a sole damaged at all.

3612. Not one?—Not one.

3613. Does that apply to small soles as well as large?—I never saw any small soles.

3614. Are they generally one size?—Yes.

3615. What size will they be?—They range from a foot to 15 inches.

3616. Did you never get soles as small as these?—I never got one.

3617. Then all soles that come up are uninjured?—Yes.

3618. You say soles run from a foot to 15 inches long?—Yes.

3619. Have you ever seen a haddock brought up 15 inches long?—Yes.

3620. Do you find them damaged in the net?—Part are damaged and part are not.

3621. Then a large part of your take would be damaged?—I should say the greater part would be damaged.

3622. And yet the soles are not damaged?—No, soles are not damaged.

3623. What reason do you give for that?—I can't tell but I never saw a damaged sole during the time I was in the smack.

3624. Did you say that you would find a haddock 15 inches long caught by the trawl undamaged?—I don't suppose you would, but you might.

3625. Did you ever see cod 15 inches long come up in the trawl net?—Yes.

3626. Were they damaged?—Yes, a great part of them were.

3627. Were the large cod damaged?—No.

3628. About what size do you call a large fish?—About that size (*measuring*). I think they float on the top of the trawl nets and that keeps them from going on the ground.

3629. How small is the size of the cod you have seen come up without being damaged?—From a foot to 15 inches.

3630. That has not been damaged?—Not at all.

3631. But a haddock of that size is damaged?—Generally so, because it is a much tenderer fish than the young cod.

3632. Did you ever see any fish with the gall bladder burst when the trawl was drawn up?—I never opened any of them, but I rather think it would be.

3633. Why do you think so?—Because they have such a nasty smell. If you smell one of these fish you will think that it is so.

3634. Do you think that the gall smells?—I have opened many a fish and broken the gall bladder.

3635. And has it a smell?—It has a smell and a taste also.

3636. Have you tasted gall?—I have tasted gall. I have fried haddocks caught in the trawl net, and have found them with a nasty bitter taste which I think was in consequence of the gall bladder having been burst.

3637. Did you taste the fish brought up in the trawl?—Yes; I did not do it always, but I have eaten them.

3638. You said you knew the gall had burst by the smell?—Yes.

3639. Then I judge from that that it has a particular smell, what is it?—Well, it had no particular smell but it had a particular taste.

3640. You said you judged from the smell?—All I know is that we have never had any smell from our own hook-caught fish.

3641. You spoke just now of a great quantity of spawn coming up in the net?—Yes.

3642. What sort of stuff was it?—From what I could see of it it was herring spawn.

3643. What sort of appearance had it?—There were pieces about this size (*holding up his hand*); they were in clusters.

3644. In clusters?—Yes; they were of a yellow colour.

3645. Were they quite loose?—No, they were in a body.

3646. Were they in a kind of ball?—Yes, but of different shapes.

3647. Had it a horny stiffish kind of feel when you took hold of it?—Yes, it was quite stiffish.

3648. Was it sticky?—I can't say that it was.

3649. Could you break it easily in your fingers?—Yes.

3650. Quite easily?—Yes.

3651. Was it tough?—It was rather toughish with a substance of a watery nature in the middle of it.

3652. Was it hollow?—No, it was substance but with a watery nature.

3653. Did you ever see young fish in it?—No, never.

3654. Did you ever see black spots like the eyes of fish in it?—No, never.

3655. Did you ever see herring spawn?—Yes.

3656. Where did you see it?—In the fishing boats this season.

3657. Was it like what you have been describing?—Yes. In fact I hung 20 herrings up, their spawn was all clustered together and was just the same as that which was brought up in the trawl nets.

3658. Then you think it was herring spawn you saw?—Yes.

3659. Did you ever see any herring spawn in the fish brought up in the smack?—No, I never saw them.

3660. Do you think that flat-fish or any other fish feed on the herring spawn?—I am sure I cannot tell; it is very possible that they do.

3661. How much may we understand came up at a time of this spawn?—Perhaps a ton.

3662. A ton of spawn?—Yes, or rather a ton of fish, and perhaps there would be a basket of it at a time. It would be all mixed up with mud and spawn, and in fact it was all mingled together, and we generally tossed it overboard.

3663. Then on the average there would be a basketful of spawn every time the trawl was hauled up?—Yes.

3664. Where was the trawling ground upon which you observed this?—It was off Sunderland.

3665. Off Sunderland?—Yes, in about 25 or 30 fathoms of water.

3666. Is that the same trawling ground that was described just now?—Yes.

3667. What time was that?—I think it would be about the month of July.

3668. Do you recollect the day at all?—No, I don't recollect the day.

3669. Were there any herrings about here at that time?—No, none.

3670. Had there been any before?—There had been none in-shore. There might have been some in the offing, but there were none of our men catching them.

3671. There was no appearance of herring at that time?—No.

3672. There were no birds or porpoises?—No, but we generally see birds at all times.

3673. If you know what is called the 'appearance' of herring you will know what I mean. Was there a peculiar clustering of birds. Have you been a herring-catcher?—Yes.

3674. Then you know what they call the 'appearance' of herring, do you not?—Yes.

3675. When was this that you were trawling?—In 1862.

3676. In July 1862?—Yes.

3677. And it was then that you took up large quantities of herring spawn?—Yes.

3678. Yet there had been no trace of herrings there before?—No.

SUNDERLAND.

H. Meldrum.

28 Sept. 1863.

3679. Then how did you get it?—There had been herring there no doubt, though they were not visible.

3680. Is it customary in this part of the country to find full herrings in July?—Not frequently.

3681. Did you ever hear of full herrings in July?—No.

3682. Do you know what time the herring spawn?—That I don't know.

3683. You know what a full fish is?—Yes.

3684. What time do you get full fish here?—We have had them at all seasons.

3685. But in what months?—This month.

3686. Do you mean the month of September?—Yes.

3687. Did you ever get full fish in August?—Yes.

3688. What—full fish?—Yes.

3689. Did you get it in the early part of August?—Yes, more so in the early part of August than in the back end.

3690. Is it more common to get full fish here then than in September?—Yes.

3691. They never fish here for herrings in July?—Very seldom; I never did it myself.

3692. Were you in the trawler later than July—in August or September?—I was only there a few weeks.

3693. Was any of the witnesses who have been examined proprietor of the boat?—No; he is here in the room, but he has not been examined.

3694. Are you acquainted with anybody else who has seen the spawn taken in trawl-boats?—No.

3695. Have you ever heard of it?—Never. I have only been speaking of what I have seen. It is no gain to me to come here to be examined, but I am merely giving you all the information I can.

3696. Have you seen any other spawn but that of herring taken in the trawl-boats?—I don't know any other spawn.

3697. Have you seen anything taken up that was at all like herring spawn?—Yes, there are several things that imitate spawn, but whether it is spawn or not I cannot tell.

3698. But you are clear about the herring spawn?—Yes.

3699. What day in July was it?—It was about the middle of July.

3700. How do you know that it was July?—To tell the truth, I went merely for pastime. I don't exactly recollect the time, but if you ask about the time no doubt the man to whom the boat belonged will tell you.

3701. I only mean what month it was, nothing else?—I think it was July, but I am not sure.

3702. What is your ordinary occupation?—I am a seaman.

3703. Do you go herring-fishing here?—Yes, and lobster-catching as well.

3704. Does your herring-fishing begin in August?—Yes.

3705. Was there anything that kept you from herring-fishing that year?—I don't think I was herring-fishing that year at all.

3706. Were you away during the months the herring-fishing lasted?—Yes, I was shell-fishing.

3707. You were engaged during these two months?—Yes, I was in the shell-fishing during the season.

3708. Then it is quite clear that you could not have been away trawling during the same months?—I suppose it would be after the shell-fishing that I went trawling.

3709. It happens to be a matter of some importance to get the exact date; can't you give us a better idea of the time?—No, I can't tell you.

3710. Is there anybody here who can tell?—Yes, the skipper of the vessel is here.

H. Roberts.

HENRY ROBERTS called and examined.

3711. (*Professor Huxley.*) Are you the skipper?—Yes, but I am not supposed to tell him his time.

3712. What time was it, I want to know?—It would be the latter part of September and the first part of October. It would be between those two months.

The witness withdrew.

H. Meldrum.

HENRY MELDRUM re-called and examined.

3713. (*Professor Huxley.*) Do you think that these fish now on the table are injured or not?—No.

3714. But they were brought up in a trawl net?—Yes, but it is the haddocks that are principally damaged; they are of a much softer nature than other fish.

3715. Are fish as small as these caught by the hook?—No.

3716. You never saw fish so small as these caught by the hook?—No, except it might have been by little boys fishing in the river.

3717. (*Mr. Caird.*) Do you say that the fish now upon the table were caught in the trawl,—those very fish?—Yes.

3718. Do you say that all the small fish are injured in the trawl?—Yes, they are all injured.

3719. How are they injured?—You can tell that they are injured by the smell of them.

3720. Show me how they are injured?—You can tell that by the softness of them; good fish are as stiff as can be.

3721. How long is it since these fish were in the trawl?—They were all caught yesterday.

The witness withdrew.

W. Boyes.

WILLIAM BOYES called and examined.

3722. (*M Caird.*) With regard to these small fish that are said to have been caught in a trawl, do you happen to know whether they were caught in a trawl or not?—Yes.

3723. How do you know that?—Because they were fetched ashore in a trawl net.

3724. Are they in an injured state at this moment?—They are just as I got them. I put them in a basket and covered them over.

3725. Have they been injured by the trawl?—Yes.

3726. In what way?—There are the fins and other parts of the fish mashed to pieces; likewise the guts, they are all mashed and chafed to pieces.

3727. (*Professor Huxley.*) Do you consider these to be specimens of damaged fish?—Of course they must be; they are damaged fish.

3728. Do you think that if you had caught these dabs with the hook and line that they would not have been in the same condition?—Not in the least.

3729. Why, this is Monday?—Yes.

3730. Have you any evidence to show at what time these fish were caught?—No; they came on shore on Saturday at 11 o'clock.

3731. Is there anything to prevent their having been caught on the Friday?—I do not know, they came ashore for sale on Saturday.

3732. But you do not know how long they had then been caught?—No, I do not know how long they had been in the vessel.

3733. They might have been caught on the Friday?—I cannot say.

3734. You cannot say of your own knowledge?—I cannot say whether it was Friday or not; all that I know is that they come ashore every day, therefore they must have been caught between Friday night and Saturday morning.

3735. Why, these fish are stale. If you put your

nose to them you will ascertain that fact at once?—Yes; they will not keep like the line-fish.

3736. But they are quite stale?—Yes.

3737. Now, do you think it is quite fair to bring these forward as specimens of trawl-fish when they have kept for three days at least?—There is only one day gone by yet.

3738. But if they were caught on Saturday morning, Sunday has since elapsed, and this is the afternoon of Monday?—That is two days.

3739. But, I suppose, the boat would have to come here after the fish was caught?—I do not know, I did not catch it. I only brought them here to show the size of the fish they caught, and the mashed state they are in.

3740. But there is another question I wanted to ask you, are those fish damaged or not?—Certainly they are.

3741. But these fish are not bruised?—Of course they are.

3742. Do you mean to say they are bruised?—Yes.

3743. In what way?—The gut is emaciated for one thing.

3744. Emaciated is not bruised?—All the fins are bruised.

3745. Then, by emaciated you mean bruised?—Yes; mashed.

3746. You mean smashed?—Yes; but we must speak our own mother's tongue.

3747. Are the scales off those fish?—Yes, they are.

3748. Let us see (*scraping off the scales with a knife*), why, here are the scales?—They are not scales.

3749. Nonsense; do you think I do not know what scales are, why it is as rough as a rasp?—The scales are off several of these fish.

3750. Bring me another. I will tell you if the scales are there or not. (*Examining another fish*), Why, I can feel the scales here; they are as much on this fish as ever they were. (*Examining another*), The scales are partly off that one. What I wish to get at is a simple matter of fact. An assertion has been made that the scales are off these fish; but when I take out my knife and scrape them I can scrape off as many as I want. I do not see that these fish are broken in any way; their skin does not appear to have been broken?—Yes, it is.

3751. Will you show me one?—There is one (*holding up a fish*).

3752. Why, the skin is not broken here. The gills have been broken, but the flesh of the fish is not broken at all?—Yes, it is broken.

I tell you that the flesh of the fish is not broken at all.

(*Mr. Caird.*) Bring some others that you say are broken.

3753. (*Professor Huxley.*) Our only desire is to get at the fact?—Here is another.

3754. The reason why we have gone so particularly into this point is this: it is quite right that you who are adverse to the trawlers should state your own opinion. You bring your own specimens of the fish and you tell us these are trawled fish, and that they are bruised and damaged. We have examined the fish one by one, and we neither find them bruised nor scaled. If those specimens are damaged fish, I do not know anything about it.—We cannot catch a small fish like this one on the hook, and if you destroy all the small fish you will have no big ones.

SUNDERLAND.

W. Boyes.

28 Sept. 1863.

3754*a*. That is quite another thing. Do you consider that these are the largest of the small fish caught by the trawl?—There are a good deal of them much smaller than that. Some of them are that small (*pointing to the first joint of his finger*). Some of them are much more scaled than these are.

3755. How is it that small fish like that are caught in the trawl. So far as I understand the mesh of the trawl net is an inch and three quarters from knot to knot?—I do not know how small it is, but it will fetch up a crown piece, and the more weight it has in the net the closer the meshes will draw together.

3756. Is it brought up by the weight of the net?—Yes; it draws the fish up altogether.

3757. Am I to understand that you do not think any regulation with regard to the size of the mesh of the trawl net would do any good?—I do not think it would.

3758. What is the largest sized mesh you have ever seen used in trawling?—I can hardly say.

3759. If it is as big as the mesh of a turbot net would it catch all the fish?—Yes; supposing that the main part of it was made to contain a weight. If you can fetch up sand, surely you can fetch up anything less than a crown piece.

3760. Do you think that the size of the mesh is not a matter of much consequence?—I cannot say so.

3761. Do you think that if the mesh were made 4 inches wide it would still catch small fish?—Yes, provided we were getting on heavy ground. The bag shakes up, and all that gets in the bag must tend to stop it up. A piece of wood would stop it up.

3762. Would the fish stop it?—Yes, if they got big ones in they would stop the small ones from coming out.

3763. Have you ever seen trawling?—Yes, I have trawled about a dozen times. I have a small trawl net of my own, but I do not use it much. I take to the line-fishing in preference.

3764. Do you ever get spawn in your trawl net?—No, I only fish with the trawl in shallow water about two or three fathoms.

3765. Do you ever fish with it for soles?—Yes.

3766. And you never get spawn of any sort?—No, we always trawl on the clean smooth ground where there is nothing to interrupt us.

The witness withdrew.

HENRY ROBERTS re-called and examined.

H. Roberts.

3767. (*Mr. Caird.*) Are you a trawl-fisherman?—Yes.

3768. Where do you hail from?—Hull. I served seven years apprenticeship to it.

3769. Have you been at sea as a fisherman?—Yes.

3770. How long have you fished here on this coast?—This is the seventh summer that I have been here.

3771. Do you find in your experience in fishing on this coast that your catch of fish has increased or diminished?—It has increased by one half this year.

3772. Can you give us a comparison by taking one month when you first commenced fishing seven years ago and a month now?—We get two fish where we only got one formerly. With an average breeze we can catch from 18 to 30 hampers.

3773. From 18 to 30 hampers?—Yes, and each hamper will weigh from 7 to 7½ stones.

3774. And how many would you get?—With a nice breeze we should get in two or three tides about 30 hampers, and we should average from 40 pairs of soles to 75 or 90 pairs.

3775. You would do that now?—Yes.

3776. What was the quantity of fish you caught seven years ago?—Seven years ago it would average from 20 to 25 or 30 pairs or soles and about 13 small baskets of fish.

3777. Has that increase been going on gradually?—It keeps increasing. There are more vessels employed in the fishing now than were ever known before. On a general rule where there have been five or six vessels for some years there are now from 11 to 13.

3778. And are the whole of them getting as good fishing as you?—Yes, there is a variation. Sometimes some will go along and get a good week's work. Even though they are fishing alongside and within hail of each other there will be a great difference in the takes of some boats fishing from a mile to half-a-mile of each other.

3779. At what distance from the coast?—From 15

SUNDERLAND.

H. Roberts.

28 Sept. 1863.

to 18 miles. If the wind happens to be westerly we drop off.

3780. Do you find it more successful to fish here than off Hull?—No; there are more fish by half at Hull than there are here, but we cannot get them so fresh to market.

3781. You can come in here quicker?—Yes, we can bring the fish in more fresh out of the water. We can almost bring them in alive into the market.

3782. Is that the reason why you have come here to fish?—Yes.

3783. Are they mostly Hull trawlers that fish off this coast?—Yes, they are from Hull and from Brixham, but the most of them belong to Hull.

3784. And has the number been increasing year by year?—Yes, and it will continue to do so.

3785. For the same reason?—Yes, because they can get their fish fresh to market.

3786. Do you ever bring up any spawn in your trawl net?—I never saw any unless it was herring spawn.

3787. Have you caught herring spawn?—Yes, in abundance.

3788. In the trawl?—Not in the trawl, but in the fish themselves, particularly in the haddock caught off the Dogger Bank, the Well Bank, and the Off Banks. We have been catching 20 hampers of fish, and we have not had one that has been clear of herring spawn.

3789. Do you mean herring spawn that has been taken by other fish as food; do you find it in the inside of the fish?— Yes.

3790. You mean what the fish has eaten?—Yes, what they have devoured.

3791. But you never found it in a lump in the net?—No, I think that would be impossible. It could not take place.

3792. Then you do not agree with the other witness who said that it frequently came up in the net?—No, I think it is impossible that it could.

3793. Why is it impossible?—Why, herring spawn is like the cod's roe. When the herring shoots it it is just the same, and there are plenty of dog-fish to devour it. We catch herring spawn on the Dogger Bank when we have shoal water, from seven fathoms up to 15. We generally average 28 to 36 and 40 fathoms off here, but the herring swims light in the water and as it spawns so the haddocks eat it.

3794. Did you ever notice when you had been drawing up the trawl whether you had much dead fish in the net?—Yes, we have often as much dead fish as alive.

3795. Are the dead fish marketable fish?—Yes, they are all marketable, they have all been caught between five and six and eight hours.

3796. Have you no unmarketable fish?—Yes, if we have a strong wind. If it happens to blow hard we have to take our net along at a rapid rate, and if there happens to be a great deal of surf on heaving it up it will wash about a great deal until we get it on board, and the consequence is that occasionally the fish are terribly mashed about.

3797. What do you think of the fish that has been produced before us to-day?—Why I think if the man who brought them here had been out of the water as long as those fish have he would want a little dubbing himself.

3798. Are these small fish not marketable?—Why the larger fish are the better they are, and the lighter they swim in the net. They keep clear of the dirt at the bottom of the net. It is those dabs that create the dirt.

3799. How many baskets of fish will you bring up in your net in one haul?—That will depend very much on the breeze we have.

3800. But take an average haul?—If we have three hours breeze out of a six hours' tide we can raise up seven or eight hampers.

3801. Seven or eight hampers altogether?—Yes, we should do that here on this ground.

3802. When you sort the fish how many hampers would be small fish not saleable in the market?—The whole of these would be fit for the market.

3803. The seven or eight hampers would be marketable fish?—Yes.

3804. And how many hampers would there be of unmarketable fish?—Perhaps a basket, perhaps not so much, perhaps sometimes there might be a couple of baskets.

3805. Has it ever occurred in your experience that one half of the fish you bring to the surface is not marketable fish?—No, that is entirely false.

3806. Has a quarter of the fish been unmarketable?—No, nor a fourth part of it, sometimes we may have a few that are not marketable.

3807. Have you found that the fish are injured from being knocked about in the trawl?—At different times I have seen some of it bruised. It has probably been blowing a heavy gale, and sometimes we have had the net alongside and it has taken us two hours to draw it in. In that case some of the scales might be knocked off the fish and the inside of the fish might be a little rubbed.

3808. I understand that the fish taken off this coast is not opened and gutted directly it is caught?—If it was it would make 24 hours difference. The fish you have seen here to-day has its gut in. If it had been taken out it would have kept for 15 hours longer.

3809. Do you find when you go to market with trawl-fish that it does not bring as good a price as the fish caught with hook and line?—Decidedly they do. We can get our fish in here when they cannot get out to supply the market at all.

3810. But when both descriptions of fish come in together, does yours bring as much money as theirs?—If I were to buy fish for the purpose of selling it again, I think I should buy hooked fish.

3811. Is that because they look better?—Yes, because they look a little better; they are brighter and they have all their slime upon them.

3812. (*Professor Huxley.*) This fish has been just placed on the table, and I understand that it was caught last night. Now look at that fish; is it what you consider a good specimen of a trawled fish?—That is as beautiful a fish as was ever caught. I will open it; there is the gut, now I will shew you the gall.

3813. I want to know whether you consider that fish a fair specimen of a trawled fish?—Yes, it is as fresh as you would get it at any market in England.

3814. Are the majority of trawled fish in as good condition as that?—Equally as good.

3815. You were speaking of the hooked fish being better. You say nothing about their having the scales on?—No, they are better in appearance.

3816. These fish have their scales on, have they not?—Yes, but they have not the slime.

3817. Do you mean the slime or the scales?—The slime, which makes the fish appear better when it is first caught.

3818. This fish has its scales?—Yes.

3819. You were talking just now about the haddock eating the spawn of the herring, how do you know that? Do you find the spawn in the stomachs of the haddock?—Yes, they are often full of nothing else. In fact, we cannot get the fish without twisting the bag and then the spawn runs out of them, but we only find that in shoal water off the Dogger Bank and the Well Bank.

3820. What depth do you call shoal water?—Eight or 10 fathoms of water.

3821. Do the herring spawn on the Dogger Bank?—Yes.

3822. Do you find herring there?—Yes, I believe they take their course there. For the last four or five years they have taken their course to the east of the Dogger up the Yarmouth roads.

3823. What time of the year do the herring spawn over there?—I do not know what time, but we have caught the haddock in that state in the month of December.

3824. You have caught them full of herring spawn?—Yes.

SUNDERLAND.

H. Roberts.

28 Sept. 1863.

3825. Do you catch them at any other part of the year?—Only in the month of December.

3826. When you catch them in that state do you find them in shoals?—Yes, for instance, I may be fishing here, and another boat there, and I may have 30 hampers while my neighbour has none.

3827. Do you think the haddock are feeding on the spawn?—Decidedly I do.

3828. There is a great difference between you and the other witnesses?—Probably so; one man's experience is very different from another's.

3829. But here is a difference as to a matter of fact. At what time of the year was the last witness on board your smack?—Between the latter part of December.

3830. You heard what he stated?—Yes; what he mentioned to you as being herring spawn is what we call "teats"; some call them "thumbs". It is a kind of weed that grows at the bottom of the sea, but I believe it is of a living nature. It would be about the size of your fist.

3831. Is it like this (*showing a drawing*)?—Yes, and it is full of holes. It is full of nothing but water. We catch many tons of that during the year.

3832. Do you catch it at any particular time?—No, there is no particular time at which we catch it.

3833. At the particular time to which the last witness referred, can you state that this was the substance he spoke of, as having been brought up in the net?—Yes.

3834. Then he was stating what was perfectly true, but he was mistaken in the nature of what it was?—Yes, but he knows nothing about what it was. He does not know what fishing is at all. He understands nothing but crab and lobster-fishing.

3835. Did you ever get haddocks with herring spawn in them in the month of September?—Yes, I have got them 50 or 60 miles out at sea off the Dogger Bank.

3836. What part were you fishing when Meldrum saw these things?—We were fishing off Sunderland, E.N.E. of this.

3837. Do you often get the herring spawn in the haddock there?—I never saw such a thing as herring spawn in my life off this coast.

3838. Do you think that Meldrum has confounded the two things?—Yes, he has misunderstood the thing altogether.

3839. Have you been a herring fisherman?—No, I never went herring-driving in my life.

The witness withdrew.

REAVELEY ATKINSON called and examined.

R. Atkinson.

3840. (*Mr. Caird.*) Do you wish to offer us any evidence?—I wish to make an observation or two. I am not a regular fisherman. I am only engaged as a sort of amateur fisherman, but I think I can give you some evidence that will be of service to you.

3841. What experience have you had of the fisheries on this coast?—I have lived at Sunderland all my life, and I have been more or less connected with the seas. My father was a waterman, and all my brothers, with the exception of one, have been upon the sea. In former years, when I was a little boy, I usually accompanied them, and in fishing at that time we could always take an abundance of fish. I remember distinctly 25 years ago, when my father was living, that we caught on one occasion upwards of 100 haddocks. They were not very large haddocks, but were a little smaller than the three now lying on the table. We could do that almost every day in the neighbourhood of Ryhope, two miles south of this. We used to fish then in from three to five and six fathoms of water, or perhaps a fathom or two more, about half a mile or three quarters of a mile from the shore. I have frequently fished in the same place since then, and I have found the supply of fish gradually decreasing, especially during the last five or six years. About six years ago a young man named Anthony Gibson and I were fishing in that neighbourhood and we caught about 16 haddocks, a larger quantity of whiting, and a few flat-fish. Since then I have fished there more or less every year. I have a small boat of my own about the length of this table, and I can only go to sea when the weather is very fine, but my experience is that every year the number of fish is growing less and less. Three years ago I caught four or five haddocks. Last year I only caught two. And this year, although fishing under the same circumstances, and being reputed a tolerably good fisherman, yet I have only caught one. I have caught whiting and flat-fish to some extent, but not to the extent they were formerly taken.

3842. Do you know whether the total supply of fish in Sunderland market has diminished or not of late years?—I think there is as large supply as there used to be, owing to the increased number of boats employed.

3843. Is there an increased number of boats?—Yes.

3844. And they have increased the number of fish supplied?—Yes, but the take of fish has generally been less for each boat, although in the aggregate, on account of the number of boats engaged, there has perhaps been a large supply. I am perfectly satisfied, however, that the number taken by each boat is considerably less than it used to be.

3845. Have you anything to add to what was stated by the former witnesses as to the cause of the decline they have spoken of?—I cannot say anything with regard to the spawn being taken up, my experience being confined to in-shore fishing. I have never seen any spawn taken up in the trawl, but I can speak most positively as to the decrease in the supply of fish. I know there are a great number of amateur fishermen, old men and others, who go out when the weather is fine, and they can all of them corroborate the statement I make.

3846. But you cannot add anything to what was said by the other witnesses from your own knowledge as to the cause of the decline in the number of fish?—As far as I know it must result from this, that the trawlers are gradually working northward and impoverishing the fishing grounds. For the last 20 years they have been gradually working northward, and there has been an increased supply of fish, which is kept up in the same ratio as the increase in the number of boats. But now they have come further northward and are so numerous in this neighbourhood that the supply of fish is decreasing very alarmingly.

3847. Do you mean the fish caught by the line-fishermen?—Yes.

3848. Have you anything more that you desire to lay before us?—Yes. There is another kind of fishing here which I think ought to be mentioned, and that is a kind of fishing commonly called "sweeping". I have an idea that the herring fishery is destroyed to a very great extent by that process of fishing. The nets are shot out into the sea where a considerable number of young fish have congregated in the bays or creeks along shore. As the nets are drawn in, these small fry, which we call "sile", are drawn in with them. I have followed in my boat a net so drawn in. Whether they are herrings or not I cannot tell; but I have observed these young fry escaping from the net wounded and injured, writhing and turning in every direction. Of course those so injured would soon become a prey to other fish, even to a shrimp. Others that were unable to get out of the net were drawn up on the shore and left there to perish. Now I consider that to be a waste of God's gifts.

3849. (*Professor Huxley.*) By "sweeping," do you mean circular fishing?—I mean riding at anchor. It is a net put out from the shore.

3850. A seine net?—Yes.

3851. You used the word "sile." Did you apply that to the herring?—I don't know whether they are herrings or not.

3852. They are small fish?—Yes, and they have a resemblance to herrings.

The witness withdrew.

SUNDERLAND.

R. Laidler.

28 Sept. 1863.

ROBERT LAIDLER called and examined.

3853. (*Mr. Caird.*) Are you a fisherman?—No; I am a fishcurer and a fishmonger.

3854. Have you been long engaged in that business?—Yes, for 17 years.

3855. Are you in the habit of buying both line-fish and trawl-fish?—Yes.

3856. When did trawl-fish first come into the market here?—About four years ago.

3857. Has the quantity brought into the market considerably increased during that time?—Yes, they have brought great quantities of fish ashore.

3858. Are they not sold in this market?—Yes, but I never bought much of them.

3859. Don't you buy them?—Sometimes I do, and sometimes I don't. It depends very much on the quality of the fish brought in.

3860. Do you find a great difference between the quality of the line-fish and the trawl-fish?—Yes, decidedly.

3861. Do you mark that by the difference in the price which you pay?—There is a great difference sometimes in the price of the fish. We generally know what fish will suit our market. I know the fish that I can carry to market and that which I cannot carry. The fish that sometimes come ashore from the trawl-boats we could not send to market. It would not carry the distance. If it happens to be good in quality then I may buy it, and I send it to Glasgow and other parts of the country.

3862. What is the difference in the price you pay on the average for cod caught by the line and cod caught in the trawl?—This last year I have paid a good deal more for fish than I have done for the last 30 years. I used to be able to get cod for 1*s.*; this year it has cost me 2*s.* 6*d.* Ling, for which I have paid 2*s.* 6*d.*, I have this year paid 3*s.* For haddocks, which I used to get for 8*d.*, 10*d.*, or 1*s.* a stone, I have had to pay this year 15*d.* and 18*d.* a stone.

3863. Has that increase of price taken place this year?—Last year it increased a little, but not so much as this year.

3864. What do you suppose to be the cause of that increase?—It is the decrease in the number of fish brought into the market; there is not the same number of fish in the market now that there used to be.

3865. Then, is the total quantity of fish brought into Sunderland market on the increase or on the decrease?—It is rapidly on the decrease; there is not so much brought into the market by the cobles as there used to be.

3866. Has there been a decrease both in the line and the trawl-fishing?—Decidedly; the white-fishing this year has been 30 per cent. less than it has ever been before in my knowledge.

3867. Do you mean that the average supply to your market has been a third less?—Yes.

3868. Are any fish sent there without being sold in your market at all?—Not a great deal. The hawkers take away some in carts, and sell them.

3869. Is a large proportion of that which is brought on shore offered to you?—I can buy any quantity I like.

3870. Are you in a position to state whether the supply has increased or decreased during the last five years?—It has decreased very much.

3871. Can you show us in figures what that diminution amounts to?—Not at this moment, but I could by reference to my books; the price of herrings is about the same per cran or per 1,000, but for white fish and haddocks the price is much higher.

3872. I was speaking of the quantity, not of the price?—The price is generally regulated by the quantity.

3873. Are you paying more for fish this year than you did last year?—Decidedly I am.

3874. Is there a smaller supply coming on to the beach this year than there was last year?—There is a great deal less brought by the line-fishermen in the cobles.

3875. But taking both cobles and trawl-boats, is there a smaller supply?—Yes.

3876. How much has the daily or weekly supply diminished; have you any means of telling?—Yes, by the cobles; we have 13 cobles out of Whitburn, and 22 or 23 out of Sunderland, and I should say that the decrease of fish during the last few years would average one third of the take.

3877. The take of the cobles?—Yes; there are eight or nine of these trawling smacks trawling about here now. They fetch in great quantities of fish; that causes a supply, but it is not the supply that I look to; I want the line-fish.

3878. Has the total quantity brought ashore both by the cobles and the trawl-fishermen increased or decreased?—It has decreased in the cobles.

3879. But not in the trawl-boats?—I never studied or went much into the market for trawl-fish.

3880. When did trawl-fish first come into the market?—About three years ago, according to my recollection; I should say that it has not been in the market more than four years.

3881. (*Professor Huxley.*) Is there any record kept here as to the quantity of fish brought in by the cobles?—No.

3882. The Custom House authorities do not keep any record?—No.

3883. Then, there is no record of any kind kept?—No.

3884. You can only answer for what you purchase yourself?—Yes.

3885. Have you the means of knowing the quantity of trawled fish brought into the market here?—I have seen the trawls fetch in from 30, 40, to upwards of 60 pad baskets of haddocks. I have seen them below that figure. Upon an average I should say they would bring in 30 baskets at least.

3886. You have no means of knowing of your own knowledge whether the quantity of fish brought in by the trawlers has increased or diminished of late years?—I think that it has decreased.

3887. How do you know that? You stated just now that you were not a purchaser of trawled fish.—At times I buy it; it is according to the quality of the fish, whether I take it or not. Sometimes the fish will carry to the market; at other times it will not.

3888. Then, how do you know that the quantity of trawled fish supplied to this market has diminished?—We have as many boats here, and if the larger number of smacks that we have here now brought in the same quantity of stuff that the boats used to bring in formerly, the supply would be enormous. The quantity now brought in by each boat is very much smaller, and therefore I say that the number of fish has decreased.

3889. Do I understand you to say that the proportion brought in per boat has decreased?—Yes.

3890. But do you conceive that the total quantity has been increased or decreased; which do you mean?—I think it has decreased.

3891. So that not only has the total quantity decreased, but the proportion per boat also?—Yes.

3892. What means have you of knowing that?—I know what the quantity was when the boats first came here. I have seen them bring in 60 pad baskets of haddocks. I have seen skate, cod, ling, turbot, and soles fetched ashore in large quantities, and within the last year or two I believe these smackmen who are now in the room will admit that I am stating the fact when I say, that taking each night's fishing, one with the other, they won't average 20 baskets for the week round, and I have seen them average 60, and above that too.

The witness withdrew.

WILLIAM COBLEY called and examined.

3893. What are you?—Why I have been selling fish here during the last six months, and I have never seen that man who has just given evidence as a buyer of fish here all the time.

3894. Are you a salesman?—Yes, and I have three smacks here. I have been acquainted with the fisheries for the last 40 years. I was brought up in Brixham. At that time there was not a smack over on this coast but what belonged to Brixham. There were then not above 100 smacks; 30 or 40 used to leave Brixham and go to Dover and Ramsgate. I have followed that business for 17 or 18 years. Some time afterwards the smacks came down to the Silver Pits. There they found plenty of fish, and they then took to trading to Hull, and what was then only 100 or 150 has now grown up to upwards of 800. It has been stated that the smacks have cleared the west coast, and the south coast, and that now they have come to clear this coast. Now let me tell you that there are more smacks now at Brixham than there were 40 years ago. At that time there were none at all in Dover or Ramsgate, and now there are between 30 and 40, and there are 200 out of Yarmouth: 20 years ago there were none at all out of Hull, and now there are 300. The reason we have come down here is this: From the beginning of May until September our smacks have to go to the North Sea fishery from whence they send their fish to London by ice-cutters. This year they have not been able to get ice, and the consequence has been that one half the fish that has gone to London, not having sufficient ice to preserve it, has been condemned when it got there. That is the reason we have come here for three or four weeks' fishing. It was not because the fish had diminished, but because we wanted to find a nearer market for it, and not have to pay the carriage and find our fish condemned afterwards. With regard to the diminution of the fish, I have an observation to make in reference to my trade. I am a basket maker, and I supply the smacks with baskets for my fish. In Hull when we pack up our fish they go to London, and we see no more of the baskets. They are sold with the fish. 14 years ago, when I went to Hull as a basket maker, six or eight basket makers served the place, and now 20 dozen would not serve it.

3895. Is that on account of the increase in the supply of fish?—Yes, 14 years ago there were about 30 men and boys employed in making baskets, and now in Hull alone there are upwards of 200.

3896. In Hull?—Yes, the only reason the smacks are here is, that they don't like to send their fish to London and make nothing out of it. In point of fact we are anticipating at present that we shall be able to make Sunderland quite as important a fishing town as Hull is.

3897. Do you sell your own fish?—Yes, on the beach.

3898. Do you ever see long-line fish there?—No, I have seen none from the cobles since I have been here.

3899. During the time the cobles are engaged in the herring-fishing, has the market been satisfactorily supplied from the smacks?—Yes.

3900. If the supply depended on the cobles, would there be any other fish at all during the herring season?—No, none.

3901. Do not some of the long-line fishermen continue the white-fishing at the time the herring-fishing is going on?—Yes.

3902. Do the trawl-fisherman interfere with the herring-fishing at all?—No, they know nothing about it.

3903. Then during the whole time that the cobles are engaged at the herring fishery, the other fishing does not go on, so far as they are concerned?—No.

3904. But you continue your fishing?—Yes, the same as ever we did, and since I have been here, when I have been on the quay side packing up my fish, I have found them bringing in such quantities that they are not able to sell them. We cannot sell the fish because the supply is so great. If we get into Shields with a pair of soles we could not get more than a penny apiece for them, while we can get 8*d.*, 9*d.*, and 11*d.* a pound for them by sending them away.

3905. Then you can do much better by sending them away?—Yes.

3906. Do you think that the introduction of your trawled fish has lowered the price of fish in this market?—Not in the least.

3907. Has your additional supply caused a less price to be paid for the fish?—Since I have been here, there has been no coble-fish at all. The only fish we send away that there is no demand for here are soles. 20 or 30 pairs are quite enough for this market, and we cannot sell them at all unless we can supply them very cheap.

3908. Then you don't sell your fish here?—Yes, we sell all the haddocks here.

3909. You have always a good sale for the haddocks?—Yes, but with regard to the soles, the buyers, if they buy all the fish you have, pack it up and send it away. They take out baskets of haddocks to sell all over the town, but they pack up the soles for Manchester, Liverpool, and elsewhere.

3910. And how is it with regard to the cod?—There are very fair cod got here.

3911. How is it with regard to the turbot?—I don't think I have seen more than six turbots here since I have been here.

3912. Is there much ling?—No, it is very scarce. Now with regard to destroying small fish, you will perhaps allow me to mention what I have witnessed in Torbay. They use the seine nets there, and when they shoot them for sprats and herrings I have seen scores, ay hundreds, of turbots brought ashore not so large as my hand. That is a proof, I think, that the fish go to shoal water and not to deep water to spawn.

3913. (*Professor Huxley.*) Are you the only basket maker in Hull?—There are many others there now.

3914. We shall go to Hull by-and-by, and perhaps you will provide us with the exact statistics of basket making there during the last 20 years?—I shall be most happy to get them for you. When I first went there a man whom I knew had but one apprentice. He now employs 12 men and 40 apprentices, which is a clear proof that there is no dimunition in the number of fish.

3915. Do you find that the trawled fish fetch a higher price in the Manchester market than hooked fish?—No, the fish sent from Sunderland will fetch a better price than fish from any other part of the country.

3916. Do you think that the purchaser knows the difference between trawled fish and hooked fish?—No. I have received numerous letters saying that my fish sold better than many others, and it would be no use for me to send rubbish into the market. They tell me that rubbish would be of no good.

3917. What do they mean by "rubbish"?—Stale fish. I understand from those who have the carriage of the fish, that, if they had a cart of hooked fish and another cart full of trawled fish, if they had to travel 30 or 40 miles in a cart without springs the trawled fish would turn out better than the hooked fish. The hooked fish look better to the sight, but there is no solidity in it.

3918. Will hooked fish fetch more than trawled fish in Sunderland?—I have not seen any sold here, but I have heard the women selling fish here say that if it were not for us, where they can get a haddock now and sell it for a penny, they would not be able to do so for 3*d.*

3919. Do you think that in consequence of the supply of haddock sent into the market by the trawl-boats, the price of haddock has been lowered?—Yes, that must be so.

SUNDERLAND.

W. Cobley.

28 Sept. 1863.

3920. But is that the result of your experience?—Yes.

3921. Is it the general report here?—Yes. If you were to go among the women who sell the fish, you would soon be surrounded by 50 of them if you were to say a word against the smacks, and they would tear your eyes out. With regard to the man who has just given his evidence, all I have to say is, that during the time I have been here I have never seen him as a buyer of fish at all.

The witness withdrew.

G. Ainslie.

GEORGE AINSLIE examined.

3923. (*Mr. Caird.*) You are a fish salesman, I believe?—Yes.

3924. How long have you been a fish salesman?—I have been a fish salesman here for about 14 years.

3925. Have you observed any falling off in the supply of fish to this market?—There has been a great falling off in white fish—haddock, cod, ling, turbot, and skate.

3926. Do you refer particularly to the white fish caught by the cobles and the line-fishers?—Yes, to the fish caught by the cobles.

3927. Have you had any experience with regard to fish caught by the trawlers?—Not much. I have only bought it three times this year. It would not suit me at all. I cannot sell it.

3928. Why not? Is the quality inferior?—Well, after I had kept it over night I found the next morning that it was soft and the guts were coming out. I opened 20 or 30 and they smelled so strong that I threw them away.

3929. In the course of the present year you have only bought fish three times from the trawlers?—Yes, and I only had two baskets each time, for which I paid 5*s.* a basket.

3930. Has the price of fish increased?—Yes.

3931. When did it begin to increase?—Three years ago. This last year it got a good deal higher than it was three years ago.

3932. Has the introduction of the trawled fish had a tendency to diminish the price of the white fish?—No, not the price of the fish caught by the cobles; I bought it three years ago at 2*s.* a stone, and I have paid as much as 2*s.* 6*d.*, 2*s.*, 1*s.* 6*d.*, and 1*s.* 3*d.* a stone this year. I have paid as much as 2*s.* 6*d.* a stone, and 5*s.* for ling, and 3*s.* 6*d.* for cod.

3933. What would be the relative price of those fish say five years ago?—I did not deal much in white fish then, I was in the salmon-fishing. That would be 10 years ago. Five years ago you might have got haddocks at 9*d.* and 10*d.* a stone, and you would get a good cod for 1*s.* 6*d.*, and 1*s.* when they were plentiful.

3934. Do you think that the whole quantity of the white fish brought by the cobles is decreasing?—Yes, the total quantity has been decreasing for the last three years.

3935. We have been given to understand that the number of cobles has increased?—There were 12 when I first took to the white-fishing and now there are 14 at Whitburn.

3936. And do the 14 not get as much as the 12 used to get?—No, they do not. In February, March, and April I have seen only 2 crans of fish brought in in a morning.

3937. Have you noticed any difference in the quantity of herring caught year by year?—No, it will be about 20 years since I had anything to do with the herring trade.

3938. Then you do not buy herrings?—No.

3939. Do you send fish to London or Birmingham?—No.

3940. Then do you carry on your business in the local market?—Yes, I sell all I get in the Sunderland market.

3941. Then the demand for fish in the manufacturing districts does not help you in any way?—No, I do not send any fish away from home.

The witness withdrew.

R. Crick.

RICHARD CRICK called and examined.

3942. (*Mr. Caird.*) Have you paid much attention to the question of the supply of fish to this coast for some time past?—Yes.

3943. In what way has your attention been drawn to the subject?—It has been habitual for me to visit the beach morning after morning when the fish are brought in, and I have observed a great disparity in the takes of fish now as compared with what they have been during the last four or five years. In fact the fishermen have complained daily to me about the destruction going on amongst their lines. They have asked me to look into the matter for them, and I have been to various solicitors and to the magistrates, trying to obtain redress for them. I found day by day that they complained that their lines and nets were carried away. I was nevertheless informed by persons in power that they were very sorry, but that there was no remedy that they were aware of.

3944. I believe you have been present during the whole of the sitting to-day and have heard the evidence that has been given?—Yes.

3945. Can you add anything to what has been stated in the evidence of the line-fishermen?—I can only say this, the fishermen have stated to me that they have left their usual fishing grounds simply because their market was not so easy of access.

3946. That applies to the trawl-fishermen, does it not?—Yes.

3947. But have you anything to add to what has been stated by the line-fishermen?—No.

3948. Have they said anything in which you do not concur with them?—No, but I think they said nothing with regard to the fish that are now extinct altogether. At one time we were famous for skate here, and now we have none. I have seen 100 or 120 head of skate brought ashore, and never less than 50 or 60. Now there is not such a thing to be seen.

3949. How long ago is it you are speaking of, when they were so plentiful?—They were quite plentiful not five years ago. I have also seen 30 head of cod and of ling brought ashore. Now there are none. I have noticed a ton or more of fish brought in at a time, and last winter five or six fish were the most they could get at a time.

3950. What do you attribute the decrease in the skate to?—I attribute the decrease to the fact that the spawn is not allowed to come to maturity.

3951. Then in that respect you concur in the evidence of the line-fishers as to the destruction of the spawn and the young?—Yes, I have frequently seen small fish, small haddocks and flat-fish, for instance, offered at my door for sale. The whole town of Sunderland can bear testimony to that fact. It is quite habitual here to see haddocks only two inches long brought to your door and offered for sale.

3952. Do you mean that that takes place at present?—Yes, that occurred only on Friday last, and if necessary I could get two women to come here and corroborate that statement.

3953. Has that been the case for some time back?—Yes, for the last two or three years.

3954. And do the people here buy such fish?—Yes, particularly the poor people, the Irish.

3955. Is there any considerable quantity of those small fish sold?—Yes, they will bring ashore four or five baskets out of a single trawling smack in a morning.

3956. Are they sold at a cheap price?—Yes, they are sold to a number of poor girls, who sell them again, at 6*d.* or 8*d.* a basket.

3957. Could the poor who buy this fish supply themselves with other fish if they were unable to avail themselves of this?—I cannot say. I only know that they can get this very cheap, but I should think it would be very troublesome to them.

3958. Is there any other point on that head which you desire to lay before us?—No, I do not know of anything else. I only know that we are now getting fish very dear in Sunderland. At one time I could buy a good haddock for 3*d.*, perhaps five years ago; and now I am asked 9*d.* for a similar haddock. I know it is a very valuable piece of food, but if these things are allowed to go on we shall have dear beef, inasmuch as the supply both of beef and everything else will not be equal to the demand.

3959. You were a short time ago about to make an observation with regard to the reason that induces the trawl-fishermen to come into this port?—Yes, I have collected evidence from various places, and I have seen some of the old fishermen from Exmouth, Dartmouth, and Plymouth. They tell different stories, but they all agree in saying that they have come here after having destroyed the ground upon which they formerly fished. They have also told me that they have known spawn and small fish frequently sold for manure for the land.

3960. Do their statements in that respect relate to what has taken place on the south coast?—Yes.

3961. Then we shall get at that evidence more directly ourselves when we come to visit the south?—I only wished to show you that you will find considerable difference in the statements of some of these trawlers. I have entered into a correspondence with various gentlemen in Hull. One gentleman, Mr. John Dalton, is largely interested in the trawlers, and yet he tells me that if trawling is allowed to go on for five years more the trawlers will do away with themselves. He states that one of his trawling smacks cost him 1,100*l.* some time ago, and he would be glad to have 400*l.* for it now. He is a very large owner of trawling smacks.

3962. Can you give us the names of any other witness you would wish us to refer to at Hull?—I cannot give you a list at present, but I will do so at Hartlepool to-morrow.

3963. Is there any other point to which you desire to draw our attention; I mean are there any facts within your own knowledge that you wish to lay before us?—I think that you have a very difficult task before you, and I believe the only way to increase the supply of fish and to test the real merits of the case would be not to allow these men to come north of the Humber. If the Legislature passed a measure of that description, in a very few years they would see whether we have been right or not. The trawlers have now possession of three fourths of the island. Two years would test whether they have left any fish to fish for on the ground they have already run over. My impression is that at the end of these two years it would be found that we in the quarter they were excluded from trawling over would be the only people who could get fish at all. If the trawlers are to continue here for two years more, I am satisfied that we shall have no fish. That to me is a dead certainty.

3964. Is there anything else you can add. We are anxious to get as much information as we can?—I am sorry that Captain Ross has interposed his authority to prevent some of the men employed in the coastguard from coming here to give evidence. I applied to him to permit them to attend, but he said he did not wish them to come, that they had no right to give evidence in the matter, and he would have them punished for having offered to come. Now I think they ought to be summoned to attend at Hartlepool.

3965. We, as Her Majesty's Commissioners, are ready to hear any witnesses who choose to place themselves before us with regard to the matter you mention. What points would they be able to speak to?—They can prove that the spawn has been destroyed, and they can prove also by whom the destruction has taken place; they served their time, I believe, on board trawl-vessels, and they can prove the fearful destruction that takes place in trawling. One of them was for 14 years a trawler, and he tells me that he has seen as many as 300 trawl vessels assemble together. He describes the quantity of fish that has been caught, the spawn that has been destroyed, and the number of fish that has been thrown overboard.

3965*a.* We should be glad then if he would come to Hartlepool and give his evidence there. Captain Ross, if applied to, will no doubt allow them to attend. We shall instruct our Secretary to write to Captain Ross to that effect to-night.—I think their evidence will be very valuable.

3966. (*Professor Huxley.*) You stated, I think, that the law as far as you can ascertain does not afford protection to the long-line fishermen?—So we have been told.

3967. Are you acquainted with the Convention between this country and France in reference to the sea fisheries?—Do you allude to that which was passed in 1849?

3967*a.* No, I mean the Convention entered into in 1843. Are you aware of the regulation about numbering the boats?—Yes, I know the boats ought to be numbered, but the question is how you are to get hold of the number. A man says, "I have lost my "nets, but the boat which carried them away was at a "considerable distance off, and I could not distinguish "the number." In such a case you are nonplussed at once.

3968. Then how, under such circumstances, could the fishermen know what vessel had done the mischief?—He would be enabled to see a boat at that distance, and he would see her trawling down right across his lines with the tide.

3969. But that difficulty would exist with regard to any kind of law. You must have evidence before you can bring the law into operation. Do you mean to say that the nature of this fishing is such that it is impossible by any kind of regulation to punish the men who commit offences?—No, I do not say that, but there is a disinclination on the part of the people in office, our collectors of Customs and that sort of thing, to take the initiative. In point of fact, it is calling them from their daily duties, and they are very chary of taking any part in it.

3970. But this Convention has nothing to do with the collectors of Customs. An information laid before the magistrate would be quite enough?—But the fisherman who lays the information has to swear that a certain vessel is the vessel that did the injury, or that a certain man is the man who carried away his nets and lines.

3971. Yes, but if a man robs your orchard and you wish to punish him, you must have proof what man did it?—I am aware of that, but the ocean is a very broad orchard indeed.

3972. Quite so, but you stated that the law is defective, whereas, as far as I comprehend you, you only think it is difficult to administer the law?—I do not think that placing a limit within which trawl-vessels should not fish has much effect. If you limited the distance to 20 miles from the line-fishing ground there are certain persons who, if the weather was thick, would steal in among the line-fishermen. Frequently the lines are cast 20 miles off from the trawl-vessels, and yet the trawl-boats will come down upon them and take away 9*l.* or 10*l.* worth of gear. If the fishermen make any complaint, or endeavour to ascertain who has done it, they only get laughed at. Upon one occasion one of these trawl-boats brought in somebody's lines and had the impudence to claim salvage for picking them up.

3973. He had no business to touch them, had he?—He said he picked them up. I think he said he found the buoy adrift and all the lines up.

3974. But if a line was attached to the buoy he had no business whatever to destroy it?—Sometimes a line will float on the water. They have frequently

SUNDERLAND.

R. Crick.

28 Sept. 1863.

been known to get to the top of the water even with a lot of fish upon them.

3975. Have you ever known a line with 200 fish on the top of the water?—Yes, I think there have been instances of that kind.

3976. I understood you to say that you have paid great attention to this subject?—Yes.

3977. Do you think that the quantity of fish brought ashore has steadily diminished of late years?—I know that it has.

3978. But there is this difficulty that occurs to me. You say that the number of trawlers has increased?—Yes, very considerably. In Hull, within the last few years, there have been upwards of 200 trawlers built, and in Brixham probably the same number.

3979. Then if the quantity of fish is falling off at this terrible pace and your long-liners cannot catch it, how is it that it will pay to build trawling vessels and employ men to work them?—I do not know, but this I do know that they have trebled themselves according to the accounts I have received from Hull. But they also say that very great misery has been entailed upon the parties who have built these vessels. Mr. Dalton informs me that there are none of them paying.

3980. Then how can the fishing go on?—It has gone on for some time but I believe the trawlers are nearly stopped now.

3981. I dare say that you are a business man and are quite aware that a large capital must be embarked in these trawling smacks. I believe they cost, at least, from 300*l.* to 400*l.* each?—They cost much more than that, I should say from 800*l.* to 1,100*l.* each.

3982. Then do you think that if the supply of fish has been falling off so rapidly year after year,—I mean the actual quantity of fish in the sea,—these people would have gone on putting thousands and thousands of pounds every year into this business?—I only know that that has been the fact, but we see that in other businesses as well. We see the coasting trade gradually diminishing and yet coasters are being built.

3983. But these people must be paying their way in some form or other although they may not be making such large profits as they did formerly?—Yes, but they are going on with little profits ruining the living of other people. A man may commit an act of folly one year, and yet not care to do it the next.

3984. I am not speaking of what people may do hereafter, but the evidence we have had is that the number of trawlers has gone on increasing for the last 10 years?—Yes, probably that may be so.

3985. Then this is my difficulty: if there is not a large quantity of fish to catch, how is it that the men of Hull will go on year after year putting thousands of pounds in a business that does not pay?—They had plenty of ground to cover before.

3986. Do you not think that the increase in the number of trawlers is to a certain extent evidence that the quantity of fish on the ground they trawl over has not fallen off?—It is a proof that they have impoverished the ground over which they have come. I think the fact of there being so many trawlers at Hull is a proof of that. Some years ago a place was found out off this coast, called the "Silver Pits," where an immense quantity of soles was found. The trawlers soon settled there, and at that time every man was anxious to get a trawling smack, and he did so until he got his fingers burned. A gentleman of Hull told me not long ago that he would be very glad indeed if he could get 500*l.* for what had cost him more than 1,000*l.* They all acknowledge that they have made a great mistake in entering into this trawling speculation. They invested their money in trawling smacks believing it was going to be a very good thing, and now they find themselves very much mistaken.

3987. Then they have been going on committing mistakes for 10 or 11 years?—No, the great increase in the number of trawlers has not taken place within the last 10 or 11 years; they have invested the best part of their money within the last three years.

3988. Have they invested as much as 200,000*l.* within the last three years?—I should say that they have.

3989. Surely not within the last three years?—I will refer you to Mr. Dalton, whom you will most likely see at Hull. He will give you all the necessary information. I believe the collector at Hull, in one of his letters, says they have as many as 200 vessels belonging to that port now. If you examine the proper persons you will find that what I have said about the increase is the fact. There is a gentleman named Banister, in the town council, and others who will tell you that they have invested their capital very foolishly in trawling smacks.

3990. Is it your impression that the rapid building of these trawling smacks in Hull is due not to its not being a profitable occupation, but to its being a mad speculation?—Yes.

3991. Have you considered, in relation to the question of the fish getting dearer, the effect that the railroads may have had?—I do not know that we send much fish by railroad. Almost all the fish caught by the long-line fishermen is sold to the people of the town and the adjoining localities.

3992. Then you do not think that any portion of the fish caught by the line is sent to the manufacturing districts?—A man might come occasionally to buy herring and send away, but the white fish generally would be sold in the district.

3993. On the other hand, is the trawl-fish sent away by railway?—I think that may be very likely.

3994. But you know nothing of it of your own knowledge?—No.

3995. With regard to the small fish that you say are offered for sale, do I understand you to say that they are bought by the very poor people?—Yes.

3996. Of course the sole object we are concerned in here is the benefit of the people in general, of whom the poor are a very large proportion. Now, do you think it would be of advantage to these people that this supply should be stopped?—Yes, I think it ought to be stopped. Perhaps they may be able now to get 20 small fish for a penny, but I think it would be better for them to have a large fish for 6*d.*

3997. But suppose they have not got the sixpence and happen to have the penny?—They could cut up a large fish for them.

3998. But would they cut up a large fish?—When we had skate plentiful here a poor man could get a good slice of skate for a penny.

3999. I understood from your previous evidence that the price of a haddock is now 9*d.*?—Yes.

4000. Then surely a man cannot get a haddock cut up into nine parts?—Why, need makes a naked man run. All I wish to argue is that it is very bad policy to destroy the young fish.

4001. Then would you prohibit trawl-fishing on the ground that it destroys the young fish?—Not only does it do that, but it destroys the spawn as well.

4002. That would be a perfectly good argument supposing that all the young fish grew up to be large ones, but how many small ones do you think grow up out of 100?—Well, I should say quite 33 per cent.

4003. And what eats the other 70?—I cannot say.

4004. Do not you think it much better on the whole that the poor of Sunderland should have these small fish than the skate, and the cod, and the ling, and so on?—I concur in anything that would benefit mankind, but I do not think that mankind would be benefited by allowing this kind of fishing to continue.

4005. Then do you think that the injury occasioned by taking small fish entirely counterbalances all the good that can be done by getting a little more food for the poor?—Yes, I think it does a long way.

4006. Do you think that the trawl and line-fishing could co-exist on this coast by the adoption of any system of regulations?—No, I think not. I believe that if you were to drive the smacks 30 or 40 miles off they would always be among the men's lines, and then they would have no means of getting at them to know who it was that had carried away the lines.

4007. But are there not gunboats occasionally

SUNDERLAND.

R. Crick.

28 Sept. 1863.

appointed to watch the coast?—I think it would put the Government to a great deal of expense to be running gunboats out there continually. If the Government would adopt the course I suggested a little while ago I think it would prove satisfactory; that is, not to allow the trawlers to come north of the Humber for two years. That would be quite sufficient to show clearly who was right and who was wrong. If they find that we are wrong, then let them trawl away as long as they like.

4008. Do you think that the diminution of fish is entirely co-existent with the coming up of the trawlers?—Yes, I think so.

4009. At various places at which we have been the general effect of the evidence is, that the diminution in the number of fish has been gradual for the last 20 years?—That has not been so with us.

4010. Would you not have felt it before the people further north?—Yes, I think so.

4011. For example, at Newbiggin it was quite clear that the decrease in the quantity of white fish had been taking place since the year 1843, which is 20 years ago?—I do not think we could say that. Our great falling off has been from about five years ago, but perhaps the fish may have been gradually decreasing during the last 20 years. As I have already told you, there is one kind of fish totally extinct; the skate has gone altogether, and the turbot is nearly extinct. They are both fish we were once famous for, tons of them used to be brought ashore.

4012. At what distance away from the shore do you think the operations of the trawlers would affect you. You say that you would stop them north of the Humber, do you think that their fishing south of the Humber would not hurt you here?—I do not think it would do us any good, but I only suggested that they should be stopped north of the Humber in order to ascertain if our complaints have any foundation or not. I think it would demonstrate to the country that the trawlers are the sole cause of the scarcity of fish. We should have plenty here, and they would get none at all.

4013. It comes to the same thing. If you think that, you cannot suppose that trawling south of the Humber would do you much injury?—No, I think not. It is 100 miles to the Humber from here.

4014. Then do you think that 100 miles away would be sufficient?—I think if they were kept off Hull, where they say the fish is so plenteous, we should have no cause to complain. We have no desire to disturb them there.

4015. Then you do not think that any amount of trawling going on off the Humber would do you any harm?—It would not do us any great amount of harm, but my object in prohibiting trawling north of the Humber would be to shew the country that we are right and they are wrong.

4016. That would amount to the same thing?—Yes.

4017. (*Mr. Caird.*) Are you familiar with the herring-fishing on this coast?—Yes, I have been herring-fishing.

4018. Is it a fact that all the men engaged in the line-fishing go to the herring-fishing?—I do not know that that is a fact.

4019. Is the line-fishing prosecuted at the same time as the herring-fishing?—Not generally. Most of them go to the herring-fishing.

4020. Then during the herring-fishing you would be able to obtain no supply of white fish except what you got from the smacks?—That is no doubt correct, but at that time the people generally are inclined to take the herring in preference to the white fish.

4021. (*Professor Huxley.*) You are aware that the manufacturing districts take a great quantity of fish?—Yes.

4022. I understand that if there were only line-fishermen here there would be no fish taken except herrings during the herring season?—The two kinds of fishing could not take place together here. They could not work their lines while the herring nets were down.

4023. Then if there were only cobles here the herring-fishing would put a stop to the supply of white fish during the whole of the time it lasted?—Yes, but we have been quite satisfied with that.

4024. But I am talking of the manufacturing districts?—We do not send our fish there. If the trawlers would only keep to Hull they would be nearer to Leeds and the other manufacturing places than they would be here. I think that is quite sufficient to prove to you that their fishing grounds there are impoverished.

4025. (*Mr. Caird.*) I believe that some person wishes to add something to the evidence he has already given?—(*William Cobley.*) I was only anxious to say a word with regard to the price of fish. Mr. Crick has stated that you cannot get haddocks under 8*d.* or 9*d.* apiece. Now, during the three months I have been here, I have been selling baskets containing from 60 to 80 haddocks, and the highest price I have received for one of those baskets has been 5*s.* I have, however, sold far more at 2*s.* 6*d.* a basket.

4026. What would that be for each haddock?—From a halfpenny to a penny. The highest price that I have had has been 5*s.* for from 60 to 80 fish. No longer ago than the week before last I sold them at 2*s.* 6*d.* the basket.

4027. (*Professor Huxley to the witness Crick.*) What do you say to that, Mr. Crick?—It has not been habitual for me to eat trawled haddocks. He may have sold an isolated basket of fish at that price. I simply say, speaking generally, that I cannot eat one of those trawled fish, and there are lots of gentlemen in this town who can bear testimony to the fact of the gall-bladder having been burst when the fish are sold; that makes the fish anything but pleasant to eat.

4028. I understand you to say that you know the effect of eating trawled haddocks, now what is the effect?—I was quite sick and bad through eating one.

4029. Then are you of opinion that they are unwholesome?—Yes, I think so.

4030. Do you think that those haddocks now on the table are unwholesome fish?—I only know that I vomited after I had eaten one of them.

4031. Has there been any great increase in the bills of mortality in this place since the people here became accustomed to eat trawled fish?—I have not observed the statistics sufficiently to enable me to answer that question.

4032. But you know the statement you have made is a very grave one?—I only state what I know and what I have felt.

4033. You know that, on one occasion, you were made sick after a supper of trawled haddocks?—Yes.

4034. Now, I do not wish to cross-question you, but might not there have been many other things in the supper besides haddocks?—There might have been.

The witness withdrew.

C. Abbs.

Cooper Abbs called and examined.

4035. (*Professor Huxley.*) What are you, Mr. Abbs?—I am a member of the Board of Guardians here, and I have had the sanitary condition of the town under my consideration. I have remarked that the mortality in Sunderland has been much greater of late years than during the visits of cholera to this town.

4037. (*Mr. Caird.*) To what do you ascribe that?—I am not in a position to ascribe it to anything. I am merely stating a fact.

4038. (*Professor Huxley.*) What is the nature of the diseases to which the increase is due?—We have had many low fevers. I daresay we have also had complaints arising from such causes as bad localities—diseases arising from an unwholesome condition of the town. The question has been considered whether

SUNDERLAND.

C. Abbs.

28 Sept. 1863.

the town, after all the drainage and improvements that have gone on, ought to have been in such a condition, and we are strongly of opinion that such a result ought not to have occurred.

4039. What was the time when the increase of mortality here was first observed?—I cannot say exactly but it has continued now for a period of nearly two years.

4040. Is it more marked at one time of the year than another?—I cannot state that either, but it has been continuous during the period I have stated, and pretty regular also. I know in addition, as a member of one of the burial boards here, that the burials in that district have been almost one third more than they were in the preceding year.

4041. Does the increase of mortality affect all classes of the population, rich and poor?—That I cannot answer.

4042. Is there any cause within your knowledge to which you can ascribe the increase of mortality? Can you ascribe it to the diet of the people?—I have no information upon that subject. I did not intend giving evidence here, but I live in the immediate vicinity of the Whitburn fishery, and I have been acquainted with the fishermen there, and the supply of fish for a period of 30 years, and have had the opportunity of observing the difference in the takes of fish that existed at that time as compared with the present, and I am quite satisfied that they do not take now one half the quantity of fish they did formerly. I have not been in the habit of purchasing the fish supplied from the smacks, but I can corroborate Mr. Crick's evidence in regard to the price of fish. It is now fully double what I can recollect it to have been.

4043. Are you referring now to fish caught by the cobles?—Yes, I am referring entirely to coble-fish. I could buy haddocks formerly at 3*d.* and I have now to pay 6*d.* Cod that I could formerly get for 1*s.* and 1*s.* 8*d.* I am now obliged to pay 2*s.* 6*d.* and 3*s.* 6*d.* for.

4044. Then do your remarks apply entirely to coble-fish?—Yes. I may also say, with regard to the supply of skate, that it has very greatly fallen off lately. It is a fish that you never see now, and I recollect the time when it was very plentiful. It was formerly a fish very greatly in request, but now it can never be obtained. I am not prepared to state that the decrease in the take of fish is confined to the last three or four years. I should rather be inclined to consider with the Cullercoats people that it has been going on gradually from a much earlier period.

The witness withdrew.

The inquiry was adjourned until Tuesday, September 29, at Hartlepool.

Hartlepool, Durham, Tuesday, 29th September 1863.

HARTLEPOOL.

T. Bulmer.

29 Sept. 1863.

PRESENT:

JAMES CAIRD, Esq., M.P. (Chairman). | Professor HUXLEY, F.R.S.

THORNTON BULMER called and examined.

4045. (*Mr. Caird.*) Have you long been a fisherman here?—I was brought up a fisherman. For generations back my fore-elders were fishermen.

4046. Fishermen at Hartlepool?—Yes.

4047. How many years have you yourself been engaged in fishing?—I have been engaged in it for a good many years. I am now in my 55th year, and I have been engaged in the fishing since I was 18 years old. I have been regularly going at the fishing all the time, with the exception of the time I have been going piloting.

4048. Did you practise both the line-fishing and the herring-fishing?—Yes.

4049. Which of the two is the best source of income to the fishermen here?—I think I may establish it as a fact that considering the length of time a man will go with the line-fishing we receive more benefit from the line-fishing than from the herring-fishing.

4050. Then you mean that the line-fishing is the more important of the two for the fishermen at Hartlepool?—Yes, I do, for this reason: the herring-fishing is of short duration, and the line-fishing lasts almost nine months out of the twelve, with the exception of some years, when the men go a little longer with the herring-fishing.

4051. Comparing the present time with the period when you first began to be a line-fisher, has there been any increase in the number of boats and men employed in the line-fishing?—No; there has been a decrease.

4052. Can you give us the figures?—In the first year I went to sea line-fishing there were 52 boats.

4053. What year was that?—It was in the year 1826.

4054. How many men were there then in each boat?—Some had three men, others had two men and a boy from 17 to 18 or 19 years old.

4055. Were the boats then of the same size that they are now?—Yes, much about the same.

4056. How many boats were there last winter?—There were only 32 last winter.

4057. When did the boats begin to decrease in number materially?—As soon as this became a coal port.

4058. What was the reason of that?—There were a number of pilots here who went fishing, being pilots for the creek of Hartlepool and the river Tees. They gave up fishing, and went as pilots. As soon as they were made pilots that caused a great decrease in the number of boats.

4059. Then the falling off did not arise from any diminution in the number of fish, but because the men went as pilots?—Yes; they wanted the men to go as pilots rather than remain at the fishing.

4060. Did that pay them better than the fishing?—They expected that it would.

4061. Is then the reason of the decline here that the fishermen have become pilots instead of fishermen?—I should say so. But they have been increasing since then. There were not above 22 or 23 boats when they gave up to become pilots, and since then there has been a gradual increase in the number.

4062. They have increased from 22 or 23 up to 32?—Yes, and there will be more this winter.

4063. Will there be an increase from last winter?—Yes.

4064. Do you remember when this became a coal port?—It would be somewhere about the year 1831 or 1832.

4065. In your recollection, has the take of fish by each boat diminished?—I hardly know how to answer that question; there is such a great deal of difference. I can hardly draw any contrast between the difference.

4066. Let us take 20 years ago, when you were fishing; you may remember what quantity of fish on the average you used to bring on shore?—On the average, I should say, we brought ashore three quarters or a ton of fish in a boat.

4067. And what is the average brought on shore now?—Now, on the average, 15 or 16 stones will be the outside.

4068. Has this falling off in the quantity been accompanied by a diminution in the size of the fish?—Well, the fish do not get to the size they used to do.

4069. Do you notice that in a very marked way?—We cannot but notice it, because we are catching the fish every day in the winter when the weather will permit.

4070. In what kind of fish have you observed it more particularly ?—In the haddocks.

4071. Are the haddocks smaller than they used to be ?—Yes, they are.

4072. Has the size very much decreased ?—Yes, they have very much decreased in size.

4073. Can you give us an instance, comparing the weight of haddocks now with the average weight to which they would run 20 years ago ?—I have been catching haddocks when it has been strong weather from the eastward. After a breeze of wind from the eastward the average weight of the haddocks I caught would be from 5 to 6 lbs.

4074. What is the average weight of the haddocks caught here now ?—They will hardly be more than 3 lbs.

4075. Have you noticed the same diminution in regard to the cod ?—Yes, and there has been a great diminution in the number of cod caught. I have been going myself with another man almost at Christmas, and I have hardly caught a cod to call a cod.

4076. Were you in the habit of getting plenty of cod 20 years ago ?—I have seen the boats have to trail them out in rows on the beach and sell them in scores together.

4077. Were you at that time fishing upon the same ground that you fish upon now ?—Yes. If you get a cod now you will get 5*s.* or 6*s.* for it in the winter season, and I have seen them sold almost at 10*s.* a score during the winter season.

4078. With regard to the turbot, do you get many turbot ?—No, it pains me to think about it. I am a great sufferer. My father was a turbot-catcher, and I went with him for a series of years and I have now turbot nets laid in the strongest of weathers on the north-east quarter when the sea has been tremendously heavy. Formerly when we allowed these turbot nets to remain we should find them all straight, but now if we leave them we are in danger of losing them altogether.

4079. Have you ever lost any turbot nets ?—Yes, I had the misfortune to lose two fleets of turbot nets, and having a great family it put me to considerable inconvenience. I have lost as much as 25*l.* or 26*l.* worth of tackle at a time, and that comes very heavy upon a poor man.

4080. But you have not answered my question as to whether the quantity of turbot caught has decreased now as compared with what it was formerly ?—It has decreased very much.

4081. Can you give us any figures or any instances to show the decrease ?—25 or perhaps 26 years ago I went turbot-fishing with two other men and we have hauled up 200 turbot in one day, after our nets had laid in for 45 or 46 hours ; but now you cannot do anything of the sort. Indeed the turbot-fishing is quite lost. You dare not shoot your nets.

4082. Taking the turbot season 20 years ago and comparing it with the turbot season now, what is the difference in the catch now as compared with what it was then ?—Why, we catch none now. In point of fact, no nets have been shot with the exception of a fishmonger's. He had some nets some time ago, but they were destroyed.

4083. Then do you not practise turbot-fishing now ?—No, we cannot, on account of the trawlers.

4084. When did you discontinue it ?—This last season. I had a few nets left, but I did not shoot them for fear of their being destroyed.

4085. Then you have not set your nets at all this season ?—No, not this season.

4086. Will you tell us the reason ?—The reason is this. I believe it will be about four years the back end of last May since we saw two vessels come down to this coast. We were on the off grounds. Seeing them bear down in the direction in which our boats were we went to a brother-in-law of mine. He asked us to go down to the harbour and obtain the assistance of a steam boat if we could. The captain of the steam boat said he would go if he could get the manager's consent.

4087. What did you want with a steam boat ?—It was rather too strong for our boats.

4088. Had you your nets shot ?—Yes. We went on board the steam boat, and when we came to where the nets were the smack's boat was apart from her vessel 200 or 300 yards. We ran alongside and found they had my dan or buoy in their boat. "What are "you doing with that ?" I said, "it belongs to me." He said "I thought it was adrift, and I was hauling it up." I said "How can you say it was adrift when "you have the moorings there ?" At that time I had my nets much broken and damaged.

4089. Did the trawl destroy them ?—Yes.

4090. Not the vessel herself ?—No, it was the trawl ; the vessel could not destroy them herself.

4091. Was that the first time that your nets were injured by the trawlers ?—No, I had a fleet taken away a few years before that, but I never knew who got them. There was another vessel lying alongside of mine at the time. I went to him and told him that my nets were lying there, and that if he did not take care he would destroy them. He was very insolent to me. He used abrupt language not fit to speak before gentlemen like you. We took his number and the captain's name. We found that the vessel belonged to Hull. We took his number and his name with the intention of hauling him up before a magistrate when he came to land, but I have never seen him on the coast since. If I had seen him this summer I should have sued him for damages.

4092. Then because he did not come here again you did not follow the matter up ?—We gave the name to the Coastguard here and they made an impression on my mind that they had telegraphed along the coast and could get no intelligence of him.

4093. Do you say that this happened four years ago ?—Yes, either four or five years ago.

4094. Did you continue to lay your nets that year after that occurrence ?—Yes.

4095. Were they again disturbed ?—I lost one once after that.

4096. What was the value of the net or nets destroyed at that time ?—A turbot net is a particular net for fishing. If one part of that net gets stretched it rolls up and up until you have a great deal of trouble to put it in order again. I had to take 13 or 14 ropes from my net that were stretched so that they were of no use. There is so much trouble connected with putting them to rights, after they have been injured in that way, that you are almost certain of losing your whole season.

4097. But you did go on fishing, did you not ?—Certainly.

4098. Did you catch many turbot that season ?—No, it was not a good season.

4099. Did you go on fishing after that ?—I lost no more nets.

4100. You lost none on the following year ?—No, I lost no nets then.

4101. Did you lose any last year?—Last year I lost a whole fleet.

4102. What would be the value of that ?—It would not cost me less than 16*l.* with the tackle connected with it. I had 21 nets down and I have no doubt that there was a quantity of fish in the nets. Then there would also be the injury done to me afterwards in consequence of having lost the nets. Therefore I do not know exactly the amount of loss I sustained.

4103. Did you ascertain, or had you any opportunity of doing so, how that fleet of nets was destroyed ?—I have not the least shadow of a doubt how they were taken. There were not less than 24 smacks on this coast at the time and I have no doubt that my nets were dragged away by the trawlers.

4104. Did you ever see the nets again ?—No. Two fishermen fetched some leads ashore that were attached to them.

4105. You say you never saw the nets again ?—I went with proper tackle to try to find them, but I have never found them yet.

HARTLEPOOL.

T. Bulmer.

29 Sept. 1863.

4106. Was it during the night or the day that they were carried away ?—I cannot say.

4107. Are your nets set at night or in the day-time ?—They are set during the night.

4108. Was there anything to show the trawling vessel that there were nets there ?—Yes.

4109. You mean something that could be seen during the day, but could it also be seen during the night ?—No, it could not be seen during the night.

4110. Do you yourself hold on by the nets during the night ?—No, we come ashore and leave them.

4111. Then you had no means of ascertaining what vessel it was that carried away those nets ?—No.

4112. And therefore you had no means of recovering the loss you sustained ?—No.

4113. Did you again put in your nets last year ?—No.

4114. Then did the loss of these nets entirely put a stop to your fishing for turbot ?—Yes.

4115. Has that been the case with the other fishermen here ?—I have no doubt of it.

4116. Is there any turbot-fishing carried on here ?—No, with the exception of the fishmonger, who shot a fleet of nets, and had them destroyed.

4117. And he has discontinued the fishing also ?—Yes ; he was obliged to do so ; he had no more nets.

4118. Then you think that turbot-fishing has been put a stop to here owing to the destruction of your nets by the trawlers ?—Yes. I think the loss I sustained in the course of two years would not be less, with the value of my nets, than 50*l.* each year at least.

4119. With regard to the haddocks, can you tell me if the take of haddocks is increasing or diminishing ?—It is decreasing greatly.

4120. How is it with regard to ling ?—There have not been such takes of ling during the last few years as there used to be formerly.

4121. Does the same remark apply to skate ?—Skate have been almost abolished altogether.

4122. Was there formerly plenty of skate here ?—Yes. I have seen lots of it in the turbot nets.

4123. What do you think is the cause of the decrease ?—I think it has arisen in consequence of the destruction of the spawn.

4124. In what way is the spawn destroyed ?—The trawl nets go over the fishing-ground ; they disturb the ground, and they cannot but disturb the spawn, and after it has once been disturbed, I should say it would not ignite again.

4125. Did you ever see a trawl net hauled up ?—Yes ; I did once, but it happened to be inside out.

4126. Then there was no spawn in it ?—No, and there was no sole.

4127. Do you fish sole here much ?—No, not much.

4128. Do you trawl for sole ?—A few men trawl for soles in shoal water.

4129. Do they get many soles by that means ?—Sometimes they do, but they are rather small.

4130. Is that the only mode in which sole fishing is practised here ?—There was a time when they were caught on the hooks, and it was generally supposed that soles caught on the hooks were greatly superior to soles caught in the trawl net. They were also of a much larger size. I never saw small soles caught on the hook. They were generally good sized fish.

4131. Did you find practically that soles of the same size caught by the hook and caught by the trawl would bring an equal price ?—When they were caught here, there used to be a number of boats that followed that employment. The soles they caught were far superior to the soles caught by the net.

4132. But what I want to know is, whether they brought a higher price ?—Yes, they did.

4133. When was that description of fishing for soles discontinued ?—I cannot say. It was a life I did not follow.

4134. Did you ever follow trawling for soles ?—Yes, I did once as a lad, but I never liked it.

4135. Did you ever bring up spawn in your trawl ?—No.

4136. Did you ever disturb it ?—I never went trawling enough to enable me to say, but I think it cannot but be disturbed. Trawling is somewhat similar to ploughing. There is a chain at the mouth of the net wrapped round the ropes to keep it at the bottom.

4137. Are you describing your own trawl or a deep-sea trawl ?—I mean a deep-sea trawl.

4138. What was your own trawl like ?—It was very light in comparison. It would not disturb the spawn anything like a trawl of a greater weight attached to a vessel going at a much greater speed.

4139. Do you think that there is any spawn on the ground so near in-shore as to be caught by your trawl ?—I cannot answer that. I cannot say that I ever saw a fish in two or three fathoms water that was ready to spawn, but in deep water I have caught them in the summer season ready for spawning. It is a particular ground where the turbot goes to spawn.

4140. Do any mackerel come off your coast ?—Yes.

4141. Do you fish for mackerel ?—There are some men here who have mackerel nets.

4142. Do you find it a good business ?—I think they principally catch them along with the herring.

4143. Do the mackerel not come here when the herring are not here ?—Sometimes they do.

4144. Do you follow them then ?—When there are no herrings to be caught they will follow the mackerel.

4145. Do they get good catches ?—In some seasons I have seen 30, 40, and 50 score caught in one boat.

4146. Are there any sprats caught off this shore ?—No.

4147. Do you get any salmon trout ?—No.

4148. Or any salmon ?—No.

4149. Do you fish for shell-fish ?—Yes.

4150. For crabs and lobsters ?—Yes.

4151. Have they increased or diminished ?—They have decreased.

4152. What kind particularly ?—Both kinds, but more so the lobsters.

4153. And to what do you attribute the falling off in lobsters ?—I attribute it to the places being blocked up to which they resort.

4154. How have they been blocked up ?—They have been blocked up with ballast.

4155. Where is the ballast brought from ?—It comes from different places.

4156. Is it brought partly from your own harbour ?—There has not been much brought from our own harbour lately, but it has been deposited there by other vessels. Great quantities of slush have been taken out of West Hartlepool and Seaham. Where the vessels now throw their ballast there was a noted place for lobsters. They are almost all off the ground now.

4157. Have they all disappeared ?—Yes, there are hardly any caught there now.

4158. Is there any regulation with regard to the deposit of ballast here ?—It is not allowed to be thrown from Huntley Footdown to Black Holes in 16 fathoms of water.

4159. Is that the ground on which you expect to find crabs and lobsters ?—The crabs and lobsters are inside of that.

4160. Then can the ballast do them any damage if they are inside ?—The ballast thrown over is a sandy or a muddy substance, and it washes in.

4161. Do you attribute the falling off in the catch of lobsters and crabs to the deposit of ballast on your coast ?—Yes, to that and to the set creels, which are laid in all kinds of weather.

4162. Are the set creels for catching lobsters ?—They are creels set for catching lobsters and crabs. Men go regularly and destroy a great quantity of she fish full of berry, both crabs and lobsters, and that has a tendency to do away with the fish very greatly.

4163. Is there a sale for the she-fish ?—Yes, gentlemen generally like to use them in making sauce.

4164. With regard to bait, have you any difficulty here in getting as much bait as you want for your line-fishing ?—We have had great difficulty and have been at great expense in contending with the officials.

4165-6. Where do you get your bait, in the Tees?—Yes. We get it from Blackshore.

4167. Have you long had that privilege?—Yes, for centuries back. When it was in the hands of the Government we had no trouble, but since the Tees Conservancy Commissioners got it we have been very much annoyed. They wanted us to pay them so much money, and they tantalized us in every way and put us to great trouble and expense. They got us to take out a licence when they had no power at all to grant a licence, and they still hold our money in their hands.

4168. Do the beds yield as much as they did formerly?—Yes, I think there is as great a quantity as there used to be.

4169. Who are the commissioners to whom you refer?—They are the Tees Conservancy Commissioners.

4170. Previous to the time they had any authority there, were these beds under the authority of the Woods and Forests—the Government?—Yes.

4171. I understood you to say that they did not interfere with you?—No.

4172. Did they allow you to take as much bait as you liked?—They interfered with us in no way whatever. But of course it was to our advantage to take mussels of a regular size. Less than that would have been of no use to us.

4173. Are you aware that the bait has increased within the last six months?—Yes.

4174. What is the cause of that increase?—I can hardly satisfy you on that point. I do not know what is the cause.

4175. Do you pay anything for the mussels you get there now?—No.

4176. Then what is the difficulty if you don't pay for the mussels?—We have no difficulty now. We had it some time ago, when we had to contend with the commissioners in order to keep the privilege for ourselves.

4177. Have you now gained your point?—Yes.

4178. And are you entitled to take the bait as you used to take it formerly?—Yes.

4179. And have you found a large supply?—Yes, there is a very good supply this year.

4180. Then you do not suffer any inconvenience from the want of bait?—No.

4181. What number of boats are engaged in the herring fishery here?—There are from 120 to 130 big boats, but when the fish come in-shore there are a number of small boats that go out fishing.

4182. How many boats were engaged in the herring fishery 10 years ago?—10 years ago there would be about 80 or 90.

4183. Then there has been an increase of about one third during that time?—Yes.

4184. Are the boats larger than they were 10 years ago?—Yes.

4185. And do they shoot more nets than they used to do?—Formerly we called 15 or 16 nets a fleet of nets. Now the same boats take 30 or 32 or 33. On the average they will all carry as many as 25 nets.

4186. Then not only have the boats increased but the extent of the nets which each boat carries has also increased?—Yes.

4187. Has that been a gradual increase during the last 10 years?—Yes, I think it has.

4188. How is the take of herrings now compared with what it was 10 years ago?—10 or 15 years ago at a certain season of the year we had a great weight of herrings in at Huntley Foot.

4189. How far is Huntley Foot from here?—About 12 miles. We used to get great quantities then. If we had had as many nets then as we have now we should have almost lost the whole of them in consequence of the weight of fish we were in the habit of taking.

4190. The take was so heavy?—Yes.

4191. What is it now?—When we go in there is a small patch of ground on which we fish; two or three boats go in among the fish; each boat will come and shoot among the others. All the fish lie in very small patches.

4191*a*. Are the shoals not so large as they used to be?—No, nothing of the sort.

4192. When did a change begin to take place from large shoals to small shoals?—Formerly it was a general fishing there every year. We went there as regularly as we could go previous to a number of trawling vessels coming upon this coast.

4193. But the trawling vessels do not fish for herrings, do they?—No.

4194. Then in what way do they interfere with your herring fishing?—They disturb the shoals. We had a good prospect one year, particularly just abreast of Hartlepool. I think that some boats got as high as 4,000. It was at the commencement of the season, and there was hardly a boat that did not get a very canny draw that night. But there came in a breeze of wind from the southward and eastward, and soon there were not less than 30 trawling vessels on the coast. The weather became so rough that our men had to come on shore. It was then reported that some of these trawling vessels got herrings in their trawls that night, and after that there were no more fish got there at all.

4195. Then do you attribute the disturbance of the shoal to the presence of these trawl-boats among them?—Yes.

4196. Is there any other occasion to which you can refer when a similar thing happened?—No, I think not.

4197. Then it was only on one occasion?—No, that was a particular occasion.

4198. But that one occasion could not cause such a falling off in the total quantity of fish as you have mentioned?—I have no doubt that the falling-off is owing to their dragging their trawl nets about. You should see the volume of "marfire" there is when they are going along the bottom. It is in a complete blaze for miles round. Some people call it "water-burn." The flame from their nets is so great that if one was a herring oneself we should be terrified by it.

4199. What has disturbed the shoals do you say?—The disturbance of the water by the nets.

4200. Do you mean the trawl nets?—Yes, they break the shoals.

4201. Have you any interference to complain of on the part of the French fishing boats about here?—They used to interfere with us very much. We were much plagued with them at one time. But there is nothing for them to catch now.

4202. Have you not good herring-fishing here?—No.

4203. Then you are not interfered with by the French fishing boats?—Not much. We had two or three French fishing boats here, but they soon quitted our coast.

4204. Was that because there was nothing to catch?—Yes. If we want to catch herrings ourselves, we have to go 22 or 23 miles off Hartlepool to catch them.

4205. Used they to come here?—Yes, just in at our back door here, as it might be.

4206. When did that change of position on the part of the shoals of herrings take place?—Ever since a number of trawling vessels came off this coast.

4207. How long ago is that?—It is 14 or 15 years since they first came. They gradually increased, until at last a great number of them came down. They not only disturbed the fishing, but they told me out of their own mouths that when they came they found it a very rich piece of soil, but in the course of two or three years they would make it quiet enough.

4208. Has that decline in the herring fishery been gradual since these trawl boats made their appearance?—Certainly it has.

4209. Has it been regularly going on year by year?—We have not had a good season ever since so large a number of trawlers came off this coast.

4210. How is that?—Because they go north and

HARTLEPOOL.

J. Bulmer.

29 Sept. 1863.

south to fish, and it is a mere speculation. It is not the fishermen who buy boats, but speculators.

4211. Does that speculation answer ?—It appears so.

4212. But they go further out to fish now?—Certainly they do at the commencement of the herring season.

4213. I suppose, as you have no French on the coast, that you have no complaints with regard to their coming within the three-mile limit ?—No, the French have not annoyed us this year.

4214. Are you at all interfered with by persons wishing to regulate the time at which you should fish, or the size of your nets, or anything of that kind ?—No.

4215. Do any authorities ever interfere with you ?—No.

4216. Is there any act of the Legislature that controls you as to the time of shooting the herring nets, or anything of that kind ?—I believe there is an Act of that kind in existence.

4217. But is there anybody to enforce it ?—No, I believe not.

4218. Do you think it would be of advantage if all of you were compelled not to shoot your nets until sunset ?—Yes, I do.

4219–20. Do you think it would be of advantage to you as a fisherman if that should be done ?—Yes.

4221. Has much improvement taken place in the accommodation afforded by this harbour within your recollection ?—Yes, there has been a good deal of improvement, especially in the inside. I cannot say that there has been much improvement on the outside.

4222. Has it always been a good harbour for the fishing boats to run to in heavy weather ?—It was more so formerly than it is at present.

4223. Then have the recent improvements not added to the safety of the harbour ?—I think they have not added to the safety of the men who go to sea in small boats.

4224. Is the construction of harbours of this kind not likely, in your opinion, to afford benefit to the fishermen ?—It has not done so at Hartlepool.

4225. Have you ever observed any great difficulty in your keeping the sea, or being able to carry on your trade as a fisherman, owing to the want of a safe place to run to in heavy weather ?—I can hardly say that. When the heavy weather comes, we have to run as soon as it comes, if our boats are too small to stand it. If we were to contend with it for any length of time, we know what the result would be. We are so practised in our boats that we know almost to a hair's breadth what they will do in almost any kind of weather, and if we think the weather is going to be too heavy for us we take it in time, and run for safety.

4226. In the course of your experience has the mode of fishing by line altered, have you adopted any new plans, or do you continue to fish as you did 40 years ago ?—No, we do not fish as we did 40 years ago. There has been a great deal of improvement.

4227. Will you be good enough to tell us what the improvement is ?—Before I went a fishing and since the tackle for fishing was very inferior to what it is now. What we call the "snoods" that we put on the lines are now very much lighter than they were formerly, and they are calculated to catch more fish than formerly ; we call that an improvement.

4228. Has there been any other improvement ?—No, I know of no other improvement.

4229. Do you fish in all other respects as you did ?—Yes.

4230. Has there been any improvement in the herring nets during the last 40 years ?—Yes ; the herring nets used to be from 24 to 27, and 28, and 30 lbs. in weight, just the bare net, and now we have them as low as 12 lbs. in weight, they are so much finer and lighter, and we calculate that one net is as good as two or three of the old ones for catching fish.

4231. Is that because they are less seen by the fish ?—No, the twine is much lighter.

4232. Are the fish caught in the meshes more easily ?—Yes, much more easily.

4233. Has there been any other improvement ?—I cannot say that there has.

4234. (*Professor Huxley.*) On the first occasion that your turbot nets were taken away, how long had they been down in the sea ?—I cannot say.

4235. Do you recollect on the second occasion when a whole fleet was taken, how long they had been down in the sea ?—If I mistake not, we shot them on Tuesday and it was on the Friday that they were taken away.

4236. They were down, then, on the Wednesday and Thursday ?—Yes.

4237. Did you ever hear that that was against the law ?—Yes, I know it was against the law, but I did not know it at the time.

4238. When did you find out that it was against the law ?—When we had the dispute with the Tees Conservancy ; we then got a copy of the Act of Parliament, and I have it now.

4239. You did not know the law then ?—No, a poor fisherman don't want much to interfere with the law.

4240. It is rather the other way, the law wants to interfere with you ?—Yes, but the fishermen generally shoot their nets into the sea, when they do shoot them, and it is not always fine weather to suit them in going out to take them in again. They have also to suit their markets. Once upon a time well-vessels used to come upon the coast. They could take quantities of fish to the London market by sea. Then we could fish at any time when the weather would permit. But since we have had to bring the fish to market ourselves, we try to accommodate the purchasers, and therefore we are almost compelled in a certain sense to break that law. But no one has ever interfered with us.

4241. Are you aware whether the size of the mesh is regulated by the law ?—Yes, if I do not mistake it should be $4\frac{2}{3}$ inches from knot to knot.

4242. No : $4\frac{1}{3}$ inches ?—The size of mesh we work is from $13\frac{1}{2}$ inches to 14 inches.

4243. Does anybody ever examine your bratt nets to see that they are all right ?—No.

4244. Then it appears that a law is passed by Parliament to regulate the fisheries and you are left in entire ignorance of it unless you chance to find it out by accident ?—I only found it out when I got the Act of Parliament.

4245. When was it that you got a copy of the Act ?—It would be about three or four years since.

4246. Then this Convention was sanctioned in 1843, and for 17 years you remained in entire ignorance of it?—I never knew anything particular about it before.

4247. I do not wish to put any question to you that you might object to answer. I only wish to know if you had any means of ascertaining what the condition of the law was ?—No.

4248. Did you ever chance to shoot the bratt nets where the herring-fishing was going on ?—I have set the turbot nets where the herring-fishing was going on, but knowing that it was not right to have any buoys in the way of herring nets we have taken the dans off and put bladders on, so that the nets would go over them and would not be injured.

4249. Do you think that by doing that you were not breaking the law ?—No doubt it was an infringement of the law, but it was not doing my neighbour any harm. If I had kept the dan on it would have torn his nets and partially have destroyed them, but when I took the dan off and only put the bladder on it would do no injury to his nets.

4250. Do you know what the law is on that point ?—I believe there is a penalty.

4251. A penalty against what ?—Against the man who has the mooring there—who has the buoy.

4252. Is the penalty against the buoy, or against the nets being there ?—I cannot answer that.

4253. The law is that you shall set no such net there

at all, whether you have buoys or no buoys. I merely wished to know if you were acquainted with the law. Did you ever see the spawn of skate?—Yes, I have seen it on this beach.

4254. What is it like?—It is in what we call a "purse," not quite four square, and it has a little string in the corner.

4555. Do you know what that string is for?—No; I cannot say.

4556. Did you ever see the spawn fastened to sea-weeds by that string?—No.

4557. Have you any reason to believe that these purses, as you describe them, have been brought up in large masses by the trawlers?—I never was on board the trawlers, and I never saw a trawl hauled up except in the case I have mentioned when the trawler hawled her net up inside out.

4258. I asked you because it is quite clear that the skate have fallen off very much on this coast, and I wish to ascertain if that is in consequence of the spawn being taken by the trawlers, or from anything else?—I attribute the cause to nothing else.

4259. That is only your opinion, you cannot substantiate it by facts?—No, but previous to these trawl-vessels coming upon the coast there was plenty of skate.

4260. That is quite another thing. You have a good many small trawlers here, have you not?—I believe there have been five or six trawling for a short time, and sometimes only two or three.

4261. Do you think that they do any harm?—Well, I should say that they do harm in a certain sense. If a large trawl does harm, then according to their weight and size the small trawls do a little harm.

4262. Would you have them put down?—If I had my own way and was a legislator, I would put down all trawling and everything else that was not beneficial to the public.

4263. You would put down both the large and the small trawls?—Yes, I would if I could.

4264. Do you think that you would catch as many fish, and be able to supply the market as well after trawling was put down as before?—I think the market would be better supplied.

4265. Would as many fish go to market as go now?—Yes, I think so, and there would be more men in Hartlepool who would be prepared to catch soles with hooks. These waters have generally been good for catching both soles and turbot. Our bay is deep, and the easterly breezes about Christmas time send in great quantities of codfish and haddock.

4266. You were speaking about the Tees Conservancy Commissioners endeavouring to control you in some way. What regulations did they pass?—I can hardly tell you.

4267. Were you forbidden altogether to get bait?—They wanted to do that, but Mr. Bell, the editor of "The Mercury," will be able to give you better information than I can on that subject.

4268. How did the regulations that the Tees Conservancy Commissioners endeavoured to impose affect you?—They wanted to put restrictions upon us so that we should take in mussels of a certain size, and we had to pay so much for a licence.

4269. How much were you called upon to pay for a licence?—They agreed to let us have a licence for 5*s.* a year. There was I and two others went up to the Tees Conservancy office at Stockton, and when we got there they would not grant us a licence under 5*s.* a quarter. Now we were almost bound to have bait; we could not live without bait; we could not catch fish without bait; so we agreed to take a licence out for 5*s.* a quarter, and when we did so, we found that there was a placard all round the town threatening all fishermen with penalties for going to the Tees to get mussels at all. Mr. Bell happened to be in the higher part of the town at the time, and he said, looking at the placard, that the commissioners had no right to impose such restrictions. He and Mr. Dalby, a solicitor of this town, befriended us, and Mr. Dalby said he would do all he did free gratis. They led us right into the matter.

4270. I understand you to tell me that the Tees Conservancy Commissioners forbade your taking bait unless you paid them 5*s.* a quarter for a licence?—Yes; in the first instance they wanted us to pay so much per bushel.

4271. But what it ultimately came to was 5*s.* per quarter?—Yes; no doubt it might have gone to that length that we should not have been able to pay what they wanted. They evidently wanted to make merchandise of the mussels in the river Tees.

4271*a*. Did they impose any rule with regard to the size of the mussels that were to be taken?—They wanted us not to take them under two inches in length.

4272. Would that do you any harm?—Yes.

4273. In what way?—Because we can have very good bait out of mussels an inch and a half long; as good bait as a fisherman need put on a hook.

4274. Suppose they had made a rule that you should not take mussels under an inch and a half in length, would you have objected to that rule?—I almost think I should, because we can get good bait from mussels an inch in length, although an inch-and-a-half mussel is the regular size. An inch-and-a-half mussel is regular good bait, and I can get bait, and not bad bait either, out of mussels less than that.

4275. Then if they had said an inch, would you have objected?—Yes, I should.

4276. Why would you have objected?—Because I think it would still have been doing away with a great deal of bait.

4277. In what way?—Because I consider that mussels from an inch and a quarter to an inch and a half would be good bait.

4278. Then under an inch would not have injured your fishing?—Why, under that the bait would not be fit to use.

4279. Were there any other regulations passed about the bait?—They wanted to take all under a certain size and deposit them in an artificial bed, and then after we had laboured for them and carried the mussels to that artificial bed, they at some subsequent time would try to make us pay for them, which might have caused a great deal of inconvenience. Many a time we are compelled to come away in a squall of wind, and we have to be off as quickly as possible on account of the rapidity of the tide.

4280. Before the Tees Conservancy Commissioners got hold of the beds, had there been any falling off in the mussels?—In certain years there had been.

4281. To what do you ascribe that falling off?—There may be different reasons. Sometimes the bait has been low down to what we call the 14th buoy, and when heavy weather comes on, what with the fresh and what with the sea and the strong tide they have been swept away.

4283. Do foreigners come and take them; I mean outsiders, the people from the south or from the north?—We have had a great quantity of boats from the north this year, and some from the south. The quantity is great that comes from the north. I think there would be as many as 40 that would go up on Friday night and Saturday morning, and they would be there nearly all Sunday morning.

4284. Do these people take the mussels as they like, small and large?—I think so.

4285. Do they do any good to your mussel beds?—I cannot say that they do.

4286. If that has gone on for years would not that have diminished the supply?—It must have done so; but they are very prolific are mussels.

4287. Would you like that to go on; would you like them to come from the north and take away the mussels whenever they chose?—There is no law to prevent them.

4288. But do you not think it would be better to prevent these people by some regulation from taking the small mussels with the large?—No doubt it would be.

HARTLEPOOL.

J. Bulmer.

29 Sept. 1863.

4289. Then in that case you would not mind paying for the mussels, would you?—I cannot say. A poor man don't like to pay for everything he uses.

4290. Further north they have to pay a good price, because they have over-fished their mussel beds?—Yes, I believe they do buy them.

4291. Do you think that 5*s.* a quarter, which is only 1*l.* a year, would have been an exorbitant price to pay for bait?—But they would not have stopped there.

4292. But suppose they had stopped there?—Then I do not think it would have been an exorbitant price.

4293. Do you not think that the northern fishermen would like to have their bait for 1*l.* a year?—Yes, no doubt; but it is a privilege which we have at Hartlepool, and which Her Majesty's judges, I believe, have settled in our favour. There are even clauses in the Act, I think, which give us a claim to the beds of which I have been speaking.

4294. You made an observation just now about catching herring in the trawl nets; that is an unusual thing, is it not?—Yes.

4295. Because herring do not commonly keep on the ground, do they?—No.

4296. It is an unusual thing?—Yes, I never saw anything of the sort myself.

4297. And now let me ask you a question in reference to the marfire disturbing the herrings. I have frequently seen herrings caught myself; it is always at night, and when you haul in the nets the whole sea appears to be in a flame, does it not?—Yes.

4298. Did you ever see that disturb the herring?—Yes. I have seen so much of that among plenty of herrings that we could not catch them. They would not take the net.

4299. Does not the hauling in of the drift net give rise to a great deal of this marfire?—It disturbs it more than when it is lying, but they will not take the net even then. When it is a very dark night and the weather is very clear there is so much of that at times that they quite shun the net.

4300. Do you think that the drift net fishing does any great harm to the shoals by causing that display of marfire?—I cannot say that.

4301. But you think that the trawler does so when he makes it?—Yes, I think so; there is such a quantity. We see the herrings on both sides of a man's net when we do not get any herrings. We pull our nets backward and forward until we find the fish. When we see the fish we see them at a short distance from the man's nets but not against his nets. I think that is a proof that there is some instinct about the fish, and that they shun the nets.

4302. Do you think that the marfire does as much harm when it is occasioned by the drift nets as by the trawl nets?—The drift net cannot make anything near the amount of marfire that the trawl net makes. Their net is going sweeping along the bottom.

4303. When the drift net is being hauled in have you not seen the whole sea in a flame?—If you saw the herrings in a drift net on a dark night you would find it a very awful thing, you would be frightened at it.

4304. Are you aware that there is a law now that no herring-fishing nets shall be shot within half an hour of sunset?—Certainly.

4305. Do you want to see that regulation carried out?—I have known that there was such a law for several years.

4306. Is it the practice to shoot your nets now before sunset?—These large boats, and the French boats when they used to visit us, I have known shoot their nets two or three hours before sunset. In the north country I have seen them commence to shoot their nets two or three hours before sunset, and I have seen it also off the Yorkshire coast.

4307. Does nobody interfere with you to prevent it?—I never saw anybody interfere.

4308. Have you now any gunboats on the coast?—Yes.

4309. Do they not interfere with you or visit you?—At certain times they do.

4310. Do you not make your herring nets of cotton now?—Yes.

4311. Is that the reason that they are lighter than they were formerly?—Yes.

4312. Can you afford to make them of cotton now, I mean this last winter?—Yes, but they are rather dearer than they were.

4313. Is there any oyster-fishing here?—No.

The witness withdrew.

T. Davison.

THOMAS DAVISON called and examined.

4314. (*Mr. Caird.*) Have you been long a fisherman here?—Yes.

4315. How many years?—Between 40 and 50 years.

4316. You have heard the evidence of the previous witness, Thornton Bulmer?—Yes.

4317. Do you agree generally with what he has stated?—Yes; I think that he is quite right.

4318. Have you yourself observed that there has been any falling off in the quantity of fish caught by the line-fishermen?—Yes.

4319. Has the falling off been in various kinds of fish?—Yes, in all that we catch on this coast.

4320. Has there been any kind of fish that has fallen off more than another?—I think the greatest falling off, so far as I can see, has been in the haddock.

4321. Has the decrease been in the quantity, or in the size as well?—It has been both in quantity and in size.

4322. Can you give us an example taking 20 years ago?—20 years ago, or rather taking 30 years ago, 50 boats regularly went out; each boat would average about 1½ tons of fish. Now, at this day and within the last four or five years they don't average more than 1½ cwt., or upon a regular scale 2 cwt.

4323. With regard to the size of the haddocks, how much has it fallen off in the average?—We think in these days that if we catch one that weighs 3 lbs. we do great things. In former times we could get five or six score that would weigh 6 or 7 lbs. each.

4324. When was it that the difference came to be evident?—Since the trawling vessels came upon the coast.

4325. I think you referred to 30 years ago?—Yes, from 30 years down to the present time.

4326. Thirty years ago a boat would catch either a ton or a ton and a half?—Yes, it might be a little less some times, but that was the average generally.

4327. Within the last 10 years, has the greatest decline taken place?—Quite so.

4328. Was it a sudden decline or a gradual decrease?—It has been a gradual decrease, and if it goes on it will be utter destruction. The noble beds that we have had will become fallow ground.

4329. Has the turbot-fishing decreased?—Yes.

4330. What is the cause of that?—I know no other cause but the smacks disturbing the spawn. The fish spawn in the months of June and July, and these smacks have come in large numbers upon the coast for the last four or five years. We have had 20 or 30 smacks regularly on the coast ploughing up the ground. They heave their nets in, and when they take them up they destroy a large quantity of fish. When I was a boy of 16 or 17 or 18 years coming up to manhood we went "bratting," and I have got seven score and ten in one haul myself when they were 3*s.* 6*d.* apiece. Now, I have not used bratt nets at all for the last few years. When they have been used the fishermen could not get 40 or 50 even with vast more nets than we had when I was a young man. The decrease, in my opinion, is owing to the destruction of the spawn.

4331. Has the decrease been going on very rapidly?—Yes, it would beggar a lord, let alone a poor man, to stand it.

4332. Do the trawl-boats come on the ground that the line-fishers fish on?—Yes, on the very ground the line-fishers are on, on the very ground that the bratt nets are set.

4333. Do you think that the two kinds of fishing cannot be pursued on the same ground without destroying the line-fishing?—No, they cannot go on together without destroying the line-fishing. Our lines are two miles and more in length, and when the smacks come among them they take them away entirely.

4334. How near shore do you lay your nets?—About three miles from the shore.

4335. Then you don't go to the Dogger Bank?—No, we should require decked boats for that.

4336. What would you do to protect the fishing?—I would knock off trawl-fishing; I would knock off the heads of the trawl; I would knock off their beams. I don't want to hinder them from fishing altogether, but let them fish the same as we do.

4337. But if it is thought proper that they should continue to fish with beam trawls, is it not possible to restrict them to ground where they would not injure you?—Yes, if that is not done England will have to cry out in consequence of the falling off in the fish. In point of fact it is utter destruction that is going on.

4338. In your experience have you found that the quantity of fish brought here by the fishermen has very much decreased on the whole?—Yes, I have.

4339. Has the price of the fish increased?—Yes, it has, but it is the small quantity that we get that injures us. We could make a much better living when we had rank fish than we can now.

4340. What is rank fish?—I mean a vast quantity of fish.

4341. You attribute the blame to the trawlers; have you ever seen a trawler at actual work?—Do you mean hauling up his trawl.

4342. Yes?—Yes, I have seen that done a vast number of times, but I have never been close to them.

4343. Did you ever happen to see what was in the trawl?—No.

4344. Then you cannot speak positively as to that?—No.

4345. Have you suffered any loss in your lines or in your nets owing to the trawl-fishers?—No, I have been a very lucky man myself. I have always shunned them, but others have lost both lines and nets. The man who has just been examined has not told you the whole of the loss he has sustained.

4346. With regard to soles, do you practise trawling for soles?—No.

4347. Do you fish for soles in any other way?—No.

4348. You don't fish for soles at all?—No.

4349. Do you fish for mackerel?—No; but if they come to the net we take them.

4350. But you don't go mackerel-fishing?—No.

4351. Have you never thought it worth your while to fish for mackerel?—No, I never thought it worth my while.

4352. With regard to shell-fish—crabs and lobsters—are they increasing or diminishing?—They are decreasing.

4353. Do you attribute that to the same cause as the last witness?—Yes; there is a place that used to give much satisfaction at Seaham harbour. It was a very well known place for lobsters, and in point of fact there was no better place within 20 miles. It has been utterly destroyed in consequence of the ballast thrown in there. The place is quite smooth now, and the shell-fish like rocky ground. What used to be rocky ground is now quite smooth.

4354. Has that injury to the shell-fish been a gradually increasing one?—Yes, it has.

4355. Has there been any other cause by which the quantity of shell-fish taken has been decreased?—Yes, I think the use of the creels—lobster pots, I mean—has a tendency to decrease the quantity.

4356. Can you get more lobsters in the creels than by other means?—Yes, they let them stand in the water and they get full of lobsters and crabs. If they are allowed to continue that mode of fishing they will knock up the fishing altogether.

4357. Is it not your object when you go to fish to get as many as you can?—We don't like to make destruction.

4358. In what way do they cause destruction?—They take great quantities of the berry fish and destroy them. All these things cause destruction. They rake out the belly of the crab.

4359. Do they do that with the lobster?—No; because gentlemen like the belly.

4360. But if you get a berry lobster do you throw it back into the sea?—No; because we can get some brass for it.

4361. Has the herring-fishing declined in your experience?—Yes, greatly.

4362. Yet the number of boats employed at it has considerably increased?—Yes, considerably.

4363. By going further to sea do they make as much as they did?—There are some of our boats seeking herring at Whitby on the Yorkshire coast; there is not one on our coast. The boats are made to travel further seeking herring than they used to be. We had formerly only to go to our back door to get them, but now, if anything comes, it is only a hand's breadth. Formerly the ground was covered with herrings.

4364. Do you agree with the previous witness that some regulation should be enforced with regard to the shooting of your nets; would that be of advantage to you?—Yes; but we seldom shoot them before sunset.

4365. Do you find that it disturbs the shoals?—I cannot say that I have ever shot them until after sunset.

4366. If a regulation of that kind were enforced, do you think it would be a benefit to all fishermen?—Yes.

4367. Do you think that it would be a proper thing not to allow fishing to take place on the Sunday?—If I had 50 hands I would haul them up for it. That is just the thing we want.

4368. Do some of the boats fish on the Sunday for herring here?—Yes; some delight in it. It is a benefit to those who do. There are a great many, myself and others, who take our start on the Monday morning, and conclude on the Saturday night; but there are men among us who conclude on the Saturday night, and start fresh on the Sunday morning. They will get a better price for the fish, because the Monday morning market is clear. It is a benefit to them that we are out of the market.

4369. Do you think that it would increase the supply if everybody were to abstain from fishing one day in the week?—If there was one day in the week when there was no fishing it would make a great deal of difference; it would make one year out of every seven.

4370. Do the French fishing-boats fish constantly on this coast?—Yes.

4371. Do you think it would be an advantage that they should only fish when you do?—Yes, they should only fish at the same time.

4372. Are many of the fish sent into the interior of the country for sale?—Yes.

4373. Where are they sent to?—I daresay to most of the large towns; most of them take fish that come from this place. London, Manchester, and all the large manufacturing towns have a supply from this place.

4374. Is the price of fish altogether so high as to preclude it being used by the poorer classes?—It is very high for them; it is hard to get at.

4375. But they were formerly in the habit of using fish as an article of food?—They used to live upon it almost entirely.

HARTLEPOOL.

T. Davison.

29 Sept. 1863.

4376. Do they do so now?—No; I think they had better buy butcher's meat now; I am not speaking of the better classes, but the poor.

4377. Have they in consequence of the dearness of fish suffered in their living?—Yes, I think they have sorely.

4378. Is there no cheap fish in the market now?—No; very seldom of any kind. The poorer classes who used to get their bellyfull of fish have to make a sup of tea or coffee water do now.

4379. Are you interfered with in any way with regard to the size of your nets or the period of your fishing here; are you in any way regulated with regard to your fishing?—No.

4380. Nobody interferes with you?—No.

4381. (*Professor Huxley.*) Did you know that that there was a law of this kind: "Herring fishermen "being within the fishery limits of either country "shall comply with the laws and regulations of the "said country respecting the prohibition of fishing on "the Sabbath day." Did you ever hear of that?—No.

4382. I believe you stated that you had been a long-line fisherman mostly?—Yes.

4383. Did you ever lose much of your catch of fish by dogfish and suckers?—Yes, I have lost at times a great quantity of fish by dogfish devouring them.

4384. How much do you think you lost on the average?—I cannot say.

4385. Can you give us any notion at all; was it as much as one tenth or one thirtieth, or what?—To speak conscientiously and honestly I cannot answer the question. Sometimes the dogfish are so numerous that they will almost devour the whole; at other times they will be so scarce that there will be hardly any loss to speak of. It would rather be touching upon conscience if I were to speak more definitely as to the average of the loss.

The witness withdrew.

T. Coulson.

THOMAS COULSON called and examined.

4389. (*Mr. Caird.*) Have you been long a fisherman here?—Yes, for 32 years.

4390. Have you engaged in all the kinds of fishing practised on this coast, herring-fishing, long-line fishing, shell-fishing, and bratt-fishing?—Yes.

4391. Do you agree with what the previous witnesses have stated?—Yes.

4392. Is there anything you desire to add to what they have stated; do you think that it would be of advantage that there should be some regulation with regard to the time of shooting your herring nets?—It seldom happens that we shoot our nets before sunset or just about the time when it is setting. That is our rule generally.

4393. Do you think it would be of advantage that that rule should be strictly enforced among all of you?—Yes.

4394. Have you observed that the French boats do not adhere to that rule?—Yes, the French often, I should say, lay before sunset, that is shoot their nets.

4395. Is that a disadvantage to you?—Yes, it is like to be.

4396. In what way?—Because their nets are sweeping over the ground causing us to shift away from where we would like to be.

4397. Do the French come within the three-mile limit?—I have seen them very close in.

4398. Have you ever seen them within three miles of the shore?—Yes, I think I have.

4399. Has that been the case often?—Not very often.

4400. Do you find most fish within or without that limit?—In the first week of August we generally begin to fish in-shore; we will fish then in from 20 to 15 and 14 fathoms. We seldom fish in 12 fathoms, but sometimes we do, and occasionally in 10 fathoms, but not often.

4401. Do you find that the largest quantity of herring you catch is caught within the three-mile limit or beyond it?—I should say it is rather beyond the three-mile limit.

4402. That would be where the French have a right to go?—I don't know exactly.

4403. The limit is three miles?—It is not often that herring are to be caught within three miles of the shore.

4404. Have you observed any injury done to the shell-fish by the depositing of ballast?—I have often heard it remarked that it would do a good deal of injury in the course of time if the ballast is hove on certain grounds.

4405. Have you observed any injury done to the fish by that?—I have not observed it particularly myself.

4406. Are you a lobster-fisher?—It is a long time since I was at it, but I have been.

4407. Did you ever see a deep-sea trawl hauled up?—I have been alongside when they hauled it up but I was never aboard of the smack. Once or twice the vessel has had to haul up from us in order to have our nets cleared.

4408. Have you ever seen one of the nets hauled up?—Yes.

4409. Have you seen any spawn in it?—I cannot say.

4410. You cannot say what was in the net?—No.

4411. (*Professor Huxley.*) Have you any particular kind of vanes on your drift-net boat at the mast head?—Do you mean our herring-boats?

4412. Yes?—We generally take our mast head down when we are fishing.

4413. Do you not put your mast upon a rest?—Yes, upon what we call a "crutch."

4414. Is there any reason why you should not have a vane at the top of your mast?—The masts have to be taken down to the rest usually.

4415. But you rest them on a crutch?—Yes.

4416. Then the head of the mast will be clear of the boat?—Yes, it just goes outside.

4417. Then there is no reason why you should not have a vane on the mast?—I don't see what use it would be when the mast is down.

4418. But there is nothing to prevent your having it if it were of use?—No.

4419. Have you ever heard of any regulation on that point?—No, I never heard anything of that kind.

4420. Did you never know that this was the law: "For the purpose of distinguishing by day drift net "fishing boats from trawl boats both shall carry at the "mast head vanes which shall be at least eight inches "in height and two feet in length." Did you ever hear of that?—No, I never heard of that before.

4421. Has there ever been anybody to examine the size of the meshes of your nets?—I cannot say that I ever saw a man measure the size of our nets.

4422. Do you know whether you are bound to have them of any particular size?—I know that there is a certain hole allowed for us in the net.

4423. What is the rule?—I cannot tell the exact size of the mesh that is allowed us.

4424. Did you ever have anybody examine your nets at all?—No, I have never had any interference with them in any shape.

4425. Do you ever carry any lights at night?—Yes, we constantly have lights.

4426. How do you arrange them?—We have a pan made with rails and a box to keep the ashes inside. We make a fire and light it and it stands there and then a man or boy attends to it. We have a light for our own safeguard; if that fails we have a lantern.

4427. Did you ever hear of this law: "In order "that the boats fishing with drift nets may be easily "recognised at night, the masters of these boats shall "hoist on one of their masts two lights, one over the "other, three feet apart."—In all boats do you say?

HARTLEPOOL.

T. Coulson.

29 Sept. 1868.

4428. Yes?—Then we have done wrong, for we never had more than one light.

4429. You see it says further: "These lights shall "be kept up all the time their nets shall be in the sea, "between sunset and sunrise." Did you ever hear of "that?—No.

4430. Did you ever know that having other kinds of lights in your boat was illegal, and is forbidden?—No.

4431. There is another article which I will read: "All fishermen are forbidden, except in cases of abso- "lute necessity, to show lights under any other circum- "stances than those mentioned in the present regula- "tions." Have you ever heard of that?—No.

4432. I merely wish to know if these laws are regularly known here?—No. There may be some fishermen who know them, but I do not.

4433. But if the laws were made known all fishermen would be acquainted with them. Can you tell us when the turbot spawn?—I have been turbot-fishing for 22 years. I have seen the spawn coming out of the she fish. I consider that they spawn mostly at the back end of the month of June.

4434. They spawn in June?—Yes, in June or July.

4435. What kind of spawn is it; does it cake together when it comes out?—It is quite loose from the fish.

4436. Does it cake together like herring spawn?—I cannot say. I never noticed it particularly.

4437. The haddock spawn is like herring spawn, is it not?—It is similar.

4438. Do you know when the cod spawn?—There was one particular instance last April. I was fishing myself and caught a pretty large haddock; what we should call a large haddock now spawning; that was a singular time, because we reckon the cod and haddock begin to spawn at the back end of the month of November.

4438*a*. That is your view both with regard to the cod and haddock?—Yes. December, January, and February are the months when cod and haddock spawn most; sometimes at the back end of December. I have seen them when they have lost their spawn lying in. They don't lie in all years, but last April I saw spawn coming out of a haddock in 22 or 23 fathoms of water. I said to my mates at the time that it was a very singular thing to see spawn running out of a haddock in the middle of April. I have no doubt that about the same place where we saw this haddock haddocks would be spawning about the middle of January.

4439. Then it is unusual, so far as your experience goes, to find haddock spawning in April?—Yes, it was that that made me remark it, but I believe the weather has great influence on the fish spawning.

4440. You think that haddocks spawn generally in December or January?—Yes.

4441. What time do the herrings spawn?—I have caught them quite full in the fore part of August. I have caught full fish one week, and spawn fish another. I have caught them quite full in one week.

4442. Was that in August and September?—Yes, in August and September.

4443. That is your great herring-fishing time here?—Yes.

4444. Do you ever try for herring in January or February?—No.

4445. Is there any appearance of herring at that time?—There is a winter herring, as we call it, that comes sometimes. It has never been but once, and I think that was in December. It would be about 24 years since. We were short of bait at the time, and went to try if we could catch herrings for bait, and we got about 600 small herrings.

4446. Were they all small?—Yes, they were all small. There was no large herring about at that time.

4447. Did you ever see full fish about that time?—Yes, they were full fish; they are called winter herring.

4448. Were they full of roe or milt, as the case might be?—I cannot say.

4449. Then by saying full, did you mean that they were of full size?—Yes.

The witness withdrew.

T. Pounder.

Thomas Pounder called and examined.

4450. (*Mr. Caird.*) Are you a fisherman?—Not at present. I was some years back, and any observations I may make on this occasion will go to corroborate the statements of the previous witnesses.

4451. Have you anything that you can add to what they have already stated?—I don't know that there is anything that I can add. The haddock and cod-fishing has declined very much during the last 10 years, and the shore-fishing has declined very much during the last three years. According to the declension at that ratio, there will be very few fish left on the coast shortly.

4452. You have not yourself been a fisherman?—Not for the last 20 years or so.

The witness withdrew.

R. Pounder.

Robert Pounder called and examined.

4453. (*Mr. Caird.*) You are a fishmonger, I believe?—I have been a fisherman upwards of 40 years.

4454. Are you a fisherman now?—No, I am a fishmonger.

4455. How long have you been a fishmonger?—For the last six or seven years.

4456. Do you buy a large proportion of the fish brought ashore here?—Yes, of the kind of fish that is caught in our own boats.

4457. During the last six or seven years have you noticed any decline in the number of fish that is brought ashore here?—Yes, it has declined a great deal since the time I went a fishing.

4458. But has it declined since you began to buy fish?—Yes, a great deal.

4459. What weight of fish did each boat bring ashore six or seven years ago?—From 15 to 20 stone.

4460. What do they bring ashore now?—Now many a day they will not bring ashore 8 stone.

4461. Have you noticed in your business that there is any falling off in the size of the fish as well as in the quantity?—Yes.

4462. In which fish particularly?—In haddock.

4463. Do other fish keep their size?—Do you mean cod?

4464. Yes?—There are very few of them caught now. Many a boat will go a week, and won't get a cod.

4465. With regard to the haddock, is the size of the fish much lessened?—Yes.

4466. How much has it decreased?—If we get a haddock 3 lbs. now we think it a large one.

4467. Do you buy any trawled fish?—I never bought any except upon two occasions.

4468. In the market here do trawled fish bring as high a price as fish caught by the hook and line?—No.

4469. What is the cause of the difference?—Because a great part of the trawled fish is not fit for the market.

4470. If it is quite fresh will trawled fish sell for the same price as fish caught by the hook and line?—Trawled fish never is fresh.

4471–2. Why is that?—They are too long at sea, and they have been dragged along the bottom too much. They are like what is called a "gawped" haddock—knocked to pieces.

HARTLEPOOL.

R. Pounder.

29 Sept. 1863.

4473. You have had none here this year?—No, not on this side of the water.

4474. Then you cannot give us any comparison of the price of trawled fish and line-fish?—Yes, I can with regard to other years.

4475. What was the difference then, taking a cod of the same weight?—Our coble fish generally brings in about 15*s.* a stone, and I think it will bring nearly as much more as other fish.

4476. Would you give as much again yourself?—Yes.

4477. Where do you send it?—We send it to Manchester, London, Birmingham, Sheffield, Wolverhampton, and many other places.

4478. Where would you sell the trawled fish?—I could not send it that far; it would have to go near at hand into our own market.

4479. Who would buy it?—Some would buy it, no doubt.

4480. Who does buy the trawled fish?—I cannot tell who buys it when it gets into the country.

4481. Is it never sold in the town?—Yes, the poorer classes buy it.

4482. Do the poorer classes buy coble fish?—No, it would be too dear for them.

4483. Then the poorer classes would get no fish at all if it was not for the trawl-boats?—Yes, sometimes they would.

4484. At what times?—When it comes in very plentiful; sometimes fish are cheap, at others they are dear.

4485. In the years you have referred to when trawled-fish came into your market, what proportion of your supply was trawled fish and what proportion line-fish?—There might not have been more than 14 or 15 stones caught in one of our boats.

4486. How much would be caught in one of the others?—Perhaps more than half a ton.

4487. Then there would be a much larger quantity of trawled fish brought into the market than line-fish?—Yes.

4488. When did trawled fish first come into market?—There have been trawlers here for the last 14 or 15 years; they have been in the habit of coming in here during that time.

4489. Have they been increasing?—There have been as high as 30, 33, and 34 in one season on our coast.

4490. You cannot tell what becomes of their fish except with regard to what is sold at home; you never bought it?—Only twice, and I wish I had never seen it.

4491. Why?—Because it was quite rotten before it got to market. I sent it to Edinburgh. There is fish caught there about the winter time, but these were soles that I sent. I received back word that they were rotten when they reached, and I lost about 2*l.* by it.

4492. Do you sell shell-fish?—No, the catch of shell-fish is of little consequence now.

4493. Do you fish for turbot?—No, but I did in years gone by.

4494. (*Professor Huxley.*) Have you no notion what the average yield of the long-line fishermen will be in money?—No.

4495. What do you think a fair average earnings for a fisherman—I mean the fair year's earnings?—The question is not exactly what they get, for it must be remembered that they have a good deal of expense, so a good deal has to go out of it again.

4496. Can you give us an idea of the amount?—I never made any calculations; sometimes I got 10*s.* a day, and some days I did not get 10*d.*

4497. But you must have made something to enable you to support your family?—They were very badly supported sometimes.

4498. What would be a fair amount to place your earnings at?—For a man who goes a line-fishing, his earnings ought not to be less than 2*l.* a week.

4499. Is that what he will get for his fish?—No; I think he ought to have 2*l.* for his wages.

4500. That would be sufficient you think; how much of that would a prudent man set aside for the repair of his boat and his lines?—Every line costs 6*d.*, which for three lines is 1*s.* 6*d.* a day. I cannot tell what expense he would be put to in a week. Perhaps he might lose a line.

4501. I am speaking of the average. Suppose that he spent 20*l.* in the year for lines, and so on, would that be a fair average, or do you think it would amount to more?—It would sometimes be more and sometimes less.

4502. Then the amount he would clear for himself would be 80*l.*, do you think that a fair average?—Yes.

4503. Why were trawled fish not brought into Hartlepool this year?—Because there was nobody who would buy it.

4504. Has there been any dealing in trawled fish this year?—No.

4505. Was there any last year?—I believe there was some last year.

4506. Have the trawlers left this place?—Yes, the smacks have gone to the west side of Hartlepool.

4507. Did they not find it answer here?—The man who bought the trawled fish went to the west side and they followed him.

4508. Did he not find this place comfortable?—No, I think not.

4509. Or was it because the sale of the trawled fish turned out unprofitable?—Most of the stuff was not saleable at all.

4510. Do you mean to say that it was unfit to eat?—Yes, a large proportion of it.

4511. Was half of it unsalcable?—I have smelt the smell of it many times.

4511*a*. Was that owing to its having been trawled, or because it was left too long?—If the country knew as much about what is brought up in the trawl net they would not buy trawled fish at all.

4512. What is brought up in the trawl net?—Why, dead bodies, and everything else. Trawl-fishermen speak of bringing up two dead bodies at a time.

4513. Are there many dead bodies?—Plenty where they trawl, and they are sure to bring them up if they trawl over them.

4514. Does that happen often?—Yes, very often.

4515. Have you yourself seen the contents of a trawl net brought up upon deck?—No.

4516. Then what you state is from hearsay?—Yes.

4517. Have you ever heard of disease being occasioned by trawled fish being eaten?—No.

4518. Have you ever heard of people being laid up in consequence of eating trawled fish?—If they had, they would not have said so; they would not have reported it, probably. If they had been ill they would not have blamed the fish.

4519. You don't think that the fish would hurt them?—No, unless it stunk.

4520. But they would not eat stinking fish?—I cannot tell; there are some queer folks in the world.

4521. But you never heard of disease being occasioned in that way?—No.

4522. Where do the trawled fish go?—Into the country; to little places close at hand.

4523. Do the hawkers buy it?—Yes.

4524. Did you ever hear of disease being caused in a place where it is bought?—No.

The witness withdrew.

LAWRENCE BYRNE called and examined.

4524. (*Mr. Caird.*) Are you in the Coastguard service?—Yes.

4525–6. Have you been long stationed on this coast?—Yes, about 15 years.

4527. Are you familiar with the mode of fishing practised on this coast?—Not very, but I have often seen the fishermen go out to fish, and I have seen them come in and land with their fish. That is all.

4528. Have you been near enough to observe the mode of fishing practised by the deep-sea trawl fishermen?—Yes.

4529. On this coast?—Yes.

4530. Any information you can give us upon that point we shall be glad to have?—I have been with trawl-fishermen myself for five years.

4531. As a trawl-fisherman?—Yes, on the coast of Ireland.

4532. You have seen the mode of fishing adopted by the trawl-fishermen here, and have been a trawl-fisherman on the coast of Ireland. Is the mode of fishing practised here the same as that which is practised on the coast of Ireland?—The same sort of nets and the same sort of gear are used on the coast of Ireland as are used here.

4533. On what part of the coast of Ireland were you a trawl-fisherman?—From the bay of Dublin on the east coast, extending to the northern coast.

4534. What kind of fish did you get by trawling there?—Haddock, cod, plaice, and hake.

4535. Did you continuously follow trawl-fishing for five years?—Yes, for five years.

4536–7. What quantity of fish did you get in one single catch in a trawl on the average?—We generally used to average three hampers a day.

4538. Did you observe whether the quantity caught upon the same trawling ground increased or diminished during the five years in which you were engaged fishing there?—I did not detect any difference in the quantity caught from the time I first went there to the time I knocked off.

4539. Were there quite as many caught the last year that you were there as there were during the first?—Yes, I think so.

4540. You did not find that the practice of fishing with trawls decreased the quantity of fish which were, on the average, caught there during the five years experience you had upon that coast?—No.

4541. Did the number of trawl-boats increase or diminish during that time?—They remained about the same in number.

4542. And did they meet with much the same success each season, and make about the same profit each year by trawling?—Yes.

4543. Were the fish much damaged in a general way when they were brought up in the trawl?—That would very much depend upon the time that we towed the trawl. Sometimes we towed the trawl 12 hours, sometimes six. As a general rule the longer we towed the trawl the worse the fish were.

4544. Was it then when you towed it more than six hours that it increased the damage to the fish?—Yes, the time we towed the trawl would depend a good deal on the weather; sometimes when there were light winds it would be hardly worth while to try.

4545. Because you would go over so little ground, I suppose?—Just so; we should merely go with the flood and come back with it.

4546. What proportion now, on the average, of the fish brought up in the trawl would be in an injured state?—Well I should think two thirds would be sound.

4547. Would as much as one third be injured?—Yes.

4548. Would they be so injured as to be unmarketable?—Yes, particularly haddocks and other kind of small fish. They are a very tender fish.

4549. Were there many small fish not fit for the market at all?—Yes, a great many.

4550. Do you include them in the one third you spoke of?—Yes, in the third.

4551. So that about one third of the fish caught every day was found either to be injured or to be unfit for the market in consequence of being so small?—Yes.

4552. That was your experience?—Yes.

4553. What was done with the fish which you say were unfit for the market?—We did not send them to market at all. We kept them when we got on shore and sold them to the poor people.

4554. You did not throw them into the sea again?—No.

4555. Did you ever bring up any spawn in your nets?—Yes, I have seen spawn brought up.

4556. What kind of spawn?—Several different kinds of spawn were brought up; I could see that it was spawn.

4557. Did you bring it up in any great quantity?—Not a great quantity unless there was seaweed at the bottom, because if there were no seaweed at the bottom to bring up with the spawn the spawn would wash out of the nets, but when there was seaweed it would be brought up because the seaweed would stop the meshes.

4558. Was it common for you to bring up spawn when you brought up seaweed?—The clearer the ground was the more spawn we got.

4559. What quantity of spawn would you bring up on the average in a night?—Perhaps a wash-deck bucket full. It would be washing about the deck and we could feel it; it was like jelly.

4560. Did the men make good wages in the trawl-boat in which you were?—They averaged about 1*l.* a week.

4561. For each man who was employed?—For each man.

4562. Was the owner of the boat on board?—No.

4563. What share did he get?—2*s.* for each share, and a share for the boat.

4564. Each of the men had a share?—Yes.

4565. Did you have a share?—No, I was a boy then.

4566. Did you catch any turbot?—Yes.

4567. And all kind of white fish which are usually brought to market?—Yes, cod, haddock, turbot, soles, and plaice.

4568. Was there much line-fishing practised in Dublin Bay at the same time as the trawl-fishing?—Yes, a good deal.

4569. Were there any complaints by the line-fishermen that the trawl-fishing damaged their business?—Of course there are always complaints by the line-fishermen against the trawlers that the trawlers destroy their lines, and in fact it cannot be avoided, for many times you cannot see their lines at all.

4570. Did you very often destroy their lines?—No, we did not injure them very much, and we never did it wilfully. We sometimes did without knowing it.

4571. Did you without knowing it find that you brought up their lines?—Yes.

4572. (*Professor Huxley.*) Did you ever notice that when the trawl fish were brought up they had any bad smell about them?—No.

4573. Did you ever hear any of a boat's crew say that they had ever noticed anything of the kind?—They were not bad when they were brought up, but of course they went bad if they were kept any length of time. The dead fish that were brought up did not keep so well as the live fish.

4574. Did many of them come up alive?—Yes.

4575. What proportion of the trawl-fish came up alive, speaking upon the average?—They would average, I daresay, better than half.

4576. More than half, you think?—Yes.

4577. Those of course were not much injured?—No.

4578. Have you been accustomed to catch fish with hook and line?—No.

4579. Did the fish which were brought up in the trawl look well?—Do you mean the fish that are caught here?

4580. Yes?—Yes, I think so.

4581. Would you be able to tell them from fish that were caught with a hook and line?—I think it would be very difficult indeed to do so.

4582. You quite understand me—I am speaking of those which come up alive?—Yes.

4483. Did you ever see herrings which have been taken in a drift net brought on shore?—Yes.

HARTLEPOOL.

L. Byrne.

29 Sept. 1863.

4584. In the ordinary way ?—Yes.

4585. Is it not the fact that commonly when they are brought to shore they have their scales on and look very well ?—Yes.

4586. Did you ever see them brought ashore after there had been heavy weather, and when there had been a good deal of sea washed into the boat ?—Yes.

4587. What state were they in then ?—Most of them would have their scales off. It is washing about in the net that damages the fish.

4588. In your own judgment it is not the fact of catching the fish by means of a trawl, but the washing about in the trawl that damages them ?—Yes, because if the fish come into the net shortly before—say 10 or 20 minutes before you are about to haul your trawl, they will be brought up alive and in very fine condition; but if they get into the net just as you have shot your trawl, and remain washing about in it from six or seven to 12 hours, they will come up more or less damaged.

4589. Were you in the habit of gutting the fish on board the smack ?—Not for the market.

4590. Did you ever have any complaints from the buyers that the fish had their gall bladders burst ?—No; but you see I was an apprentice at the time, and should not have known much about it if there had been.

4591. At the same time you think that if the fish had been injured to a considerable extent you would have been likely to have heard of it ?—Yes.

4592. Are you aware what price the trawl-fish fetched in the market as compared with the fish that had been caught with a hook and line ?—They were pretty nearly equal in price.

4593. Did you ever eat trawl-fish ?—Yes, I have.

4594. Plenty of them, I daresay ?—Yes.

4595. Were you ever taken ill after eating them ?—No; we generally have the best fish aboard the boats.

4596. Did you ever eat them at dinner and supper times ?—We ate them at pretty nearly all times.

4597. How long did you generally live upon trawl-fish ?—All the time we were out.

4598. And you never heard of any person being ill after eating trawl-fish ?—No.

4599. We were talking about spawn just now, tell me what kind of stuff this is that you call spawn ?—It appears in my hand almost like boiled sago.

4600. As soft as that ?—Yes.

4601. What time of the year would it be when you got this spawn ?—I should think mostly in the winter time.

4602. Did you get more of it at one particular time than you did at another ?—No.

4603. Have you ever seen herring spawn ?—Yes.

4604. You know what that is like ?—Yes.

4605. Was this kind of spawn of which you have been speaking like that ?—No.

4606. Not like that ?—No, it looked to me to be more finer.

4607. Smaller, you mean ?—Yes.

4608. And more jelly-like ?—Yes.

4609. Herring spawn is, as you know, a very firm stuff ?—Yes.

4610. But this is all soft you say ?—Yes.

4611. So that as you stated just now if the meshes of the trawl net were not stopped with seaweed the spawn all went through ?—It would go out as the net came up from the bottom. It would wash out.

4612. You have experience in the Coastguard now; do you think that there is any kind of police regulation by which trawl-fishermen could be prevented from doing harm to the line-fishermen ?—I cannot see how the trawl-fishermen can be prevented from using their nets. I tell you what might be done. There might be a law to restrict them from trawling except for a certain number of hours a-day, but they must trawl the net on the bottom for so long.

4613. The reason, I presume, why they do not haul up the trawl quicker is because it is a great deal of trouble ?—Yes, immense.

4614. How long has it taken your boat's crew—you were three men and a boy, I suppose ?—Yes; I have known it take three hours to haul it up.

4615. And all that time your nets are knocking about and washing in the sea ?—Yes.

4616. That is enough, is it not, to damage any fish ?—Yes; it is very severe work indeed.

4617. If they had any machinery which would enable them to haul up the trawl quicker, would it not be a good deal better ?—Yes; it would be better for the fish, better for the men, and better for the cobles. It would be better for the men in the smack, because the fish that are stowed in the bottom of the net and are knocking about with a parcel of shells, and seaweed, and stones, and everything else about them, cannot be of much use.

4618. Would it be a very great hardship to the trawlers to restrict them to trawling during the daylight ?—Yes; it would, because there would be more fish about at night.

4619. You are aware that trawlers are forbidden to come within three miles of drift-net fishermen, are you not ?—Yes.

4620. Do you think that any regulation of that kind having reference to long-line fishermen would be of use ?—Yes.

4621. You think it would ?—Yes.

4622. There is this practical difficulty about it, how would the trawlers know where the long lines were set ?—In the daytime they know very well, but in the night-time they do not.

4623. How are the places marked ?—By buoys.

4624. How far could a trawler see a fisherman's buoys ?—The fisherman can make a mark by buoys which can be seen at a distance of from four to five miles.

4625. That would require a very large buoy, would it not ?—I have seen very large buoys indeed on the line.

4626. As I understand you, you do not see your way to any regulation that would take the trawlers out of the range of the long-line fishermen, at all events in the night ?—Only in the daytime when they shoot their lines and lay them down. But in the nighttime a line may be directly under the bow of a trawler, and you cannot see it. That has happened many times in my time.

4627. As matters stand at present, you do not think that trawling and long-line fishing can be carried on at the same place without the long-line fishermen giving way ?—No.

The witness withdrew.

J. Linscombe.

JOHN LINSCOMBE called and examined.

4628. (*Mr. Caird.*) Are you in the Coastguard service ?—Yes, sir.

4629. Have you been a trawl-fisherman ?—Yes.

4630. Where, on what part of the coast ?—Here and at Torbay.

4631. How long is that since ?—Seven years.

4632. It is seven years since you were a trawl-fisherman ?—Yes.

4633. How many years were you engaged as a trawl-fisherman seven years ago ?—Seven years.

4634. Seven years before that ?—Yes.

4635. Do you remember the number of vessels that hailed from Torbay at that time ?—I should say that they were from 100 to 120.

4636. Did they increase in number during the seven years that you have mentioned ?—Yes, I think there were some 10 or 12 vessels added within that time.

4637. Where did you fish ?—Off Torbay and on the Plymouth ground, and we fished also in the North Sea at that time.

4638. Did the trawl-fishermen of Torbay come at that time up to the North Sea ?—Yes.

HARTLEPOOL.

J. Linscombe.

29 Sept. 1863.

4639. To what portion of the coast did they come in the North Sea?—I cannot exactly say how far we used to come north. I know we used to come east to Ramsgate, and often used to take fish into Ramsgate.

4640. Would you come as far north as the Dogger Bank?—No.

4641. Did you, when you drew up your trawl, generally find many dead fish in the trawl net?—Yes, I have seen a great number of dead fish in the trawl.

4642. What proportion, do you think, as compared with the whole of the fish brought up, would be dead?—Well, I should think about one third.

4643. Were they principally small fish?—I have seen some big ones as well as small dead in the trawl.

4644. Speaking on the average, what proportion of the fish brought up in the trawl net would be injured, and small unmarketable fish?—I have seen a great quantity of fish thrown overboard that would not be sent to market.

4645. For what reason?—On account of their being so small. They were small whiting and haddocks here in the North Sea, but there were not so many to the westward.

4646. Were they dead?—Yes.

4647. Did you ever see any spawn brought up in the trawl net?—A little.

4648. Have you seen it brought up often?—I dare say that there was hardly a time we shot a net but what we had a little spawn brought up in the net. It was, I think, what they call squid or cuttle spawn down in the west part of England.

4649. On the ground that you were in the habit of fishing on, the Torbay and Plymouth shore, did you find that in the course of the seven years' fishing in which you were engaged the fish were getting more or less plentiful?—I cannot say. At times I have seen them very plentiful, and at other times I have known them very scarce.

4650. Was there any marked falling off during that time?—Some years they were very scarce, and in other years they were very plentiful.

4651. (*Professor Huxley.*) Did you ever notice at the time you were trawling that the fish which were brought up in the trawl had any bad smell about them as they came up?—Never.

4652. Did you ever eat trawl-fish?—Yes; in point of fact I was kept on it.

4653. It does not seem to have done you much harm, at all events?—No.

4654. Did you ever hear of anybody being made ill by it?—Never.

4655. Did your smack's crew eat it?—Always.

4656. Were they ever ill after eating it?—No.

4657. Did you ever hear of anybody in Torbay being ill after eating trawl-fish?—No.

4658. They eat a good deal of it there, do they not? Yes.

4659. What kind of spawn was it that you used to draw up in your trawl nets; was it like blackberries?—It was a kind of white slimy spawn, generally found outside the bag of the nets.

4660. Do you think it might have come from the fish inside of the net?—I think not.

4661. You were saying just now that you thought it was squid or cuttle spawn?—Something of that kind, I think.

4662. You do not really know whether it was fish spawn or not?—No, I could not swear that it was.

4663. Do you know what herring spawn is?—Yes.

4664. Was it like that?—No.

4665. You put into Ramsgate sometimes, I think you said?—Yes, we used to put into Ramsgate, and send fish to the London market.

4666. Was there any long-line fish sent in at the same time?—I think not. Not that I saw, at all events.

4667. Did you ever have your fish rejected by the buyers on account of the gall bladder being burst?—No.

4668. Did you get a good price for your fish?—At the time I was fishing I was only a boy. I believe the price was generally arranged beforehand.

The witness withdrew.

CHARLES CAMBRIDGE called and examined.

C. Cambridge.

4669. (*Mr. Caird.*) You are a boat builder here, I believe?—I am.

4670. Have you been long engaged in the business?—I have.

4671. Do you build fishing boats?—I do.

4672. Are they of various kinds and sizes?—Yes; those which are used for catching herrings, and what are used for catching cod and haddocks.

4673. Which is the largest size?—The haddock boats.

4674. Has the number of haddock boats increased of recent years?—Considerably.

4675. Both in size and in number?—Yes.

4676. Do you build a larger description of boats now than you used to do?—Yes for the herring fishery.

4677. And in line-fishing has the number increased or diminished?—I believe it is about an average. We build boats both large and small.

4678. Have you built many boats this year?—Yes.

4679. Both herring and line-fishing boats?—Yes, of both kinds.

4680. How long will a herring or line-fishing boat last if it has the good fortune not to be wrecked?—A line-fishing boat is useable down to 15 years, and a herring-fishing boat about the same time.

4681. And what is the cost of a line-fishing boat?—The expense of a line-fishing boat independent of the rudder or tiller would be about 15*l.*

4682. And what would a herring-fishing boat cost?—40*l.* or 50*l.*

4683. Are you paid for the boats when they are delivered?—Yes.

4684. Do you find any difficulty in getting payment from the fishermen?—Not generally.

4685. Not this year more than in former years?—No.

4686. You find them good customers?—All, or a considerable number, of them make it a point of duty to have the money ready for the boat when it is delivered.

4687. There is no debt on the boats?—Not worth speaking of.

4688. Is the cost of keeping the boat in repair very great?—No, not a great deal except it gets damaged by accident.

The witness withdrew.

JAMES FELLOWES called and examined.

J. Fellowes.

4689. (*Professor Huxley.*) What is your name?—James Fellowes.

4690. Are you a fisherman?—Yes.

4691. How do you fish?—By means of a trawl.

4692. Have you a smack of your own?—Yes.

4623. How long have you been employed fishing that way?—16 years.

4694. Are you a man belonging to this part of the country, or do you come from further south?—I come from Kent.

4695. From what part of Kent?—From Canterbury.

4696. Do you hail from the port of Dover then?—No, from Hull.

4697. Where have you been engaged in fishing principally?—In the North Sea, from Beachy Head to Sunderland.

HARTLEPOOL.

J. Fellowes.

29 Sept. 1863.

4698. Have you been fishing over that ground for the last 16 years?—Yes; almost 16 years.

4699. Do you trawl over one part of that district more than you do over another?—I trawl in the North Sea for the most part.

4700. What particular part of the North sea is it that you trawl over more particularly than over any other?—A place we call the "off-ground," the Silver Pits, right away to Schelling, and along this coast.

4701. What is your practice; is it to go out fishing for some time and then come into port and sell the fish you have caught? Will you be good enough to explain your ordinary practice?—We go out of port every night, and come in every morning.

4702. Do you put into this port?—Not into this; we put into West Hartlepool.

4703. Has that been your practice only this last year or two?—No, I have been in the habit of doing it these 12 years; I have been always in the habit of putting into West Hartlepool.

4704. Why do you go to West Hartlepool in particular; why do you not come here?—Because they will not buy the fish.

4705. Do you mean to say that the people who eat the fish will not buy them of you?—No, because when we go away, which will be somewhere towards Christmas, the season will be over, and if the buyers here buy the fish of us now, the Hartlepool fishermen will not let them have any fish all the winter. It would be throwing away the only chance they have.

4706. Then it is not because the people who consume the fish have any objection to trawled fish, but because the buyers are intimidated and are afraid to buy them?—Just so.

4707. And at West Hartlepool are there no long-line fishermen?—Yes, there are a few.

4708. Do they not make the same objection then?—No, there are so many who come from other places and from Scotland, and so many foreigners, that we are all in one mess like.

4709. How long do you commonly have your trawl down?—About six hours.

4710. And how long does it commonly take you in ordinary weather to haul it up?—One hour.

4711. How many men does your crew consist of?—Five hands or six is the crew of a smack; I have three men and two boys.

4712. And it takes you one hour to haul up the trawl?—Yes, except in very bad weather.

4713. How long would it take you to do it in a gale?—We can get it in fast when there is a moderate breeze, because as the vessel "fills" the net is hauled in, but I have been two hours in a gale, and I do not know whether I have not been more.

4714. That is about the longest time that it has taken you to get the trawl in?—Yes.

4715. Is it not possible to have any machinery by which you could haul in the nets quicker; would not a crane or a capstan be of any good to you?—We have a capstan; there is some improved machinery for hauling in, which has been introduced of late years.

4716. Is there much damage done to the fish by their being dragged through the water?—No, sir, I find none.

4717. None at all?—No.

4718. When the fish come up in great quantities is it good?—Very good.

4719. Is it alive?—A great deal of it.

4720. What should you say is the proportion of the fish which come up alive?—I should think it was more than two-thirds.

4721. Do you include in that estimate the small fish?—Yes, the lot.

4722. Are the small fish more commonly dead than alive when they are brought up?—No, I cannot say that they are.

4723. So that taking the large and the small fish together, the fish which are fit for the market are about two thirds?—No, I do not think that that is so, I think that they are all fit for the market.

4724. The fish that are brought up dead as well as those that are alive?—Yes.

4725. You do not consider that the dead fish are unfit for the market?—No.

4726. Are they much bruised?—No.

4727. Can you get a sale for them when you bring them on shore?—Yes.

4728. Who are the people who buy them?—They are sold in the market. Last week we had 30 large baskets of fish, which were sold to three buyers for 8*l*.

4729. But I am speaking particularly of these small sized fish?—For two or three seasons I have been catching a large number of small haddocks, but I am glad to say that this season there are very few indeed.

4730. You have found the haddocks this season of a full fair size?—Yes.

4731. How do you account for the long-line fishermen not catching them, if you can get plenty?—I account for it from the fact that they have not the same mode of fishing.

4732. Will not the haddocks take the bait?—The thing is this, the line is put out, and the fish have got to go to it, whereas we on the contrary go to the fish.

4733. But surely they ought to get some of them? And so they do I suppose.

4734. They tell us that they do not?—Facts and figures are stubborn things. If you saw them come on shore I think you would be of opinion that they get a good many.

4735. What is the average size of the haddocks which you get in the trawl?—About 12 inches long; some are larger and some smaller, but that is the average length.

4736. How many of them would go to the stone?—That I cannot tell.

4737. Are haddocks of that length what the line-fishermen would call small fish?—I do not know.

4738. Do you ever bring up any spawn in the trawl?—That is a question I do not understand unless I got a fish out of the water and took the roe out.

4739. You know what spawn is; you have seen it, I suppose?—I know what you call ray eggs, little black things.

4740. Do you get them in the trawl often?—No, not often.

4741. You do sometimes, I suppose?—When we get them, it is always a large catch of fish.

4742. Do you get them loose from the bottom?—No, not generally, I think.

4743. You think, I suppose, that the fish shoot them after they get into the trawl?—Yes, just so.

4744. Do you know what herring spawn is like?—No.

4745. You know what fishermen call spawn—a sort of gelatinous stuff—do you ever get that in your net?—I cannot say that I know what they call it.

4746. Have you ever taken trawl-fish into the market when the long-line fishermen have taken their fish there in competition with you; in West Hartlepool, for instance?—Yes.

4747. Did the fish that was brought in by the long-line fishermen sell better than yours?—I cannot say. You would be best able to get that information from the salesmen, I should think.

4748. Did you ever find the salesmen pass yours over for the sake of buying long-line fish?—No.

4749. Have any of your mates known them to do so?—That I cannot say.

4750. Have you any reason to know that it is a common thing to happen?—No, I do not know any such thing. I believe the salesmen who live by it are of another opinion, and show that they are by their actions.

4751 Do you know where the trawl-fish goes generaly?—Yes, to all parts of the kingdom.

4752 Do you hear of any complaints being made by the salesmen with respect to the gall bladder of

the trawl-fish being burst?—I never heard such a thing in my life.

4753. Are you in the habit of eating the trawl-fish?—Yes.

4754. And your smack's crew, I suppose, are in the habit of doing the same thing?—Yes.

4755. Did you ever find the fish bitter at all?—No, never.

4756. Were you ever seized with illness after eating it?—No.

4757. Did you ever know of cases of illness among the crew of the smack after eating it?—No.

4758. You have never seen any of the men taken very ill after eating trawl-fish?—No.

4759. Did you ever hear of such a thing?—No, sir.

4760. (*Mr. Caird.*) Did you ever heave any of the fish overboard?—There is a sort of fish that we call the boy's perquisites, which are sometimes thrown overboard. They are principally dabs and gurnets, not a marketable kind of fish. When they are brought on shore they are generally sold to the lower orders of people, and the produce divided among the boys. We never class them with the other fish. All the other fish that come on shore are sold to the salesmen.

4761. You do not heave them overboard at all?—No.

4762. They are always brought on shore and sold to somebody somewhere?—Yes, when there is a market for them; but when the market is glutted with herrings the people do not care much about haddocks and other white fish, but now that there are no herrings they are glad to have them.

4763. Do you find that the take of the trawl-boats is increasing or diminishing?—I should certainly not say that it was diminishing, judging by the catch last Monday night, for it was the largest quantity of fish brought on shore here that I ever saw.

4764. But taking one year with another, and not judging by the catch of one night, do you make as good a season's fishing on the whole now as you did when you first began?—Yes.

4765. Do you find as many fish on the ground which you go over as ever you did?—Yes.

4766. Then you think that the quantity of the fish is increasing, and not decreasing?—Always at all times of the year, in its season; and when the weather is good, we find the fish plentiful.

4767. What part of the south coast have you trawled upon before you came here?—On the North Foreland, on the ground round Rye bay, and off Yarmouth.

4768. Why did you leave those particular places to come to the North Sea?—Because the North Sea is so much more advantageous for my line of life.

4769. Are those places still being fished by trawl-boats?—They are.

4770. Do you know if they yield as much as they used to do when you fished over them?—Yes, and I know that they are still increasing the number of the trawl-boats.

4771. But you found it advantageous to come further north?—Yes.

4772. Because you can get larger takes of fish, I presume?—Yes, just so.

4773. And a good market for your fish?—Yes; it is a great fishing port, and a large market is Hull.

4774. Do you send fish at all to Grimsby?—It goes to Hull and Grimsby by the smack, and then by the train.

4775. You do not bring all your fish here then?—No, we leave here in a month or two's time.

4776. And then you go south to Hull?—And then we go south to Hull, and go out 60 or 100 miles.

4777. Do you go to the Dogger Bank?—No, it would hardly pay to go there. There is too much fish.

4778. Too much fish. What do you mean?—I mean that there is too much fish there, and that if we were all to go there we could not get a market for it.

4779. Because there is too much fish?—Yes.

4780. Will you be kind enough to explain that to us, for I really do not understand it?—The Dogger Bank literally swarms with haddock and plaice, and if we all fished there we could not get a price for the fish that we should bring in in our boats.

4781. Are haddocks and plaice not so profitable then?—It is the distance that we should have to go to get them that would make it unprofitable.

4782. Do you not go some distance for the winter fishing?—Yes, for winter fishing we do.

4783. As far as the Dogger Bank?—Further than that.

4784. Then it cannot be the difficulty of getting to market that prevents you from going to the Dogger Bank?—No, but there are no soles there, and that is our living mostly.

4785. They pay more for soles, I suppose?—Yes, and that is our chief living, the sole-fishing.

4786. Have you had long experience as a fisherman on the Dogger Bank, on the north coast, and on the east coast?—Yes, I have been 12 years master of a smack.

4787. Have you found that the take of fish in your trawl nets is increasing or diminishing on the whole?—I cannot say either the one way or the other.

4788. The takes are much about the same, are they?—Much about the same.

4789. Has the number of boats increased within the last few years; are they more or less in number?—They have been at a little bit of a stand-still, I think, for the last three or four years.

4790. Then the business has not been so profitable?—Not so profitable perhaps as it was three or four years ago.

4791. You told us that you sometimes trawled on the Dutch coast?—Yes.

4792. What boats did you meet with on the Dutch coast?—The London boats.

4793. Did you not meet with any of the Dutch boats?—Oh yes, swarms of them.

4794. And the French boats?—No; not French boats, but we did with the Ostend boats.

4795. Do the Ostend boats trawl in the same manner as you do?—Yes.

4796. And have they done so for many years?—Yes.

4797. Do you find as many fish on that coast as there used to be?—There has been no difference in any respect in my experience.

4798. Are there many Dutch trawling boats?—A very large quantity of them.

4799. Are they successful, generally speaking?—That I cannot tell; as soon as we get our proper quantity of fish we hoist sail and away to market.

4799*a*. Do you sell your fish in Holland or Belgium?—No.

4799*b*. You bring it to the markets here?—Yes, in ice cutters.

4800. (*Professor Huxley.*) You said just now that your business, the business of trawl-fishing, was not so profitable just now as it was three or four years ago?—No, it is not.

4801. What is the reason of that?—One reason is the very tempestuous weather we have had lately. One day we lost five smacks and all hands, and numbers of them broke their booms and lost their sails.

4802. Do you mean that the business has not been so profitable on account of unusual losses?—Yes, owing to the stormy weather.

4803. Or do you mean that the fishing business is not so profitable because the yield of the fish has fallen off both in size and quantity?—No, we could always catch as much fish as we wanted.

4804. The trawl will catch as much fish as ever, but the last year or two the weather has been such as to destroy the boats and the tackle?—It has.

4805. Do you expect that by-and-by as the losses are made good more capital will be invested in the fishing business?—Yes, they are still investing money in the fleet.

HARTLEPOOL.

J. Fellowes.

29 Sept. 1863.

4806. Supposing you had plenty of capital, would you invest it in trawl-boats?—Yes, sir.

4807. You yourself would invest money in trawl-boats?—Yes, because it is my trade.

4808. Do you think it would yield you a good return for the investment?—Certainly.

4809. (*Mr. Caird.*) Are any of the men paid by wages, or do they all get a share?—They all get a share, that is how the vessel is worked.

4810. They all share?—Yes, they all share, and nothing get nothing have.

4811. What will a man's share amount to on the average in a year?—It will amount on the average to from 1*l.* to 1*l.* 10*s.* per week.

4812. Is that taking the average of a whole season's fishing?—Taking the average of a whole twelvemonth through you mean, do you not?

4813. Yes?—Well, if a man does middling he makes about 30*s.* per week.

4814. Not more than that?—That is about the average.

4815. How many shares are there in a vessel?—Eight.

4816. How many men are there in the boat?—Three men and two boys.

4817. How many shares go to the men?—Each and gets one share and one eighth of another.

4818. How many does that make altogether; let me hear how those eight shares are divided?—Each man gets a share and an eighth. There is the skipper's two men and a boy. Out of this there is the vessel and the boy's money. Take the men's wages first: each man gets a share and one eighth out of the eight shares; the skipper gets a share and a quarter and half that again. That is the master's wages over that of the men, a quarter of a share.

4819. How many shares does the vessel itself get, does it get as much as the men?—I do not know, you must take it out of the figures.

4820. (*Professor Huxley.*) Each man gets one share and one eighth?—Yes.

4821. That is two and a quarter?—Yes.

4822. Then the skipper gets what?—A share and a quarter and half a quarter.

4823. That is altogether three shares and five eighths. Then what do the boys get?—What is left is for the vessel and the boys.

4824. Yes, but what does each boy get?—Three parts of a share.

4825. (*Mr. Caird.*) The boys are apprentices, I suppose?—Yes.

4826. And they represent the owner of the vessel in some respects. Do they take part of the owner's share?—No, the owner takes them and keeps them and looks upon them as his own children, and he takes their part of the share.

4827. So that about three and a half out of the eight shares goes to the men, and the rest to the ship and the apprentices?—Yes.

The witness withdrew.

W. Bartlett.

WILLIAM BARTLETT called and examined.

4828. (*Mr. Caird.*) Are you a trawl-fisherman?—Yes.

4829. How long have you been so?—For 30 years.

4830. Where do you hail from?—From Hull.

4831. Have you been 30 years in Hull?—No, in Hull and Torbay.

4832. How long have you been in Hull?—15 years.

4833. And 15 years you hailed from Torbay?—Yes, serving my time and all.

4834. During those 15 years that you were in Torbay did the trawl-vessels considerably increase in number?—Yes.

4835. And in size also?—Yes.

4836–7. And did the fish and the catchers of fish increase or diminish?—They increased.

4838. Were there many trawl boats at Hull when you first went there?—No, only 14 or 15.

4839. How many are there now?—They are 300 strong if you include Grimsby and Hull as one port.

4840. Did you include Grimsby also when you mentioned how many trawl-boats there were 15 years ago?—Yes.

4841. And has the take of the Hull boats, counting each boat or taking them together continued to be quite as good as the take of the small number of Hull boats was 15 years ago?—Better. We can prove that the takes are better.

4842. Do you make more money now than you did 15 years ago?—Yes.

4843. Is that on account of the greater price of the fish you catch now than you could obtain 15 years ago?—No, it is because we catch more fish.

4844. Then you don't find the fish dearer now than they were 15 years ago?—Not at all, it varies does the price of fish in the market.

4845. What may be the fair average catch of a trawl-boat at the present time?—I could tell you what I caught the other night, but one night does not make a year.

4846. What did you catch the other night?—Last Monday night I caught more fish on this ground than I ever caught before.

4847. But taking one year, taking this last year, for instance, and comparing it with the quantity of fish caught in one year, say ten years ago, would you say that you have an increased quantity of fish now as compared to what you had then?—Yes, we increase, go where we will, if you will allow us to explain it to you. On the Hartlepool ground, as upon every other ground, the oftener the smacks and the trawls go there the more fish they get, and for this reason; we compare the fish in the sea with the birds in the air, the farmer in the field with the fisherman in the sea. The farmer in the field ploughs the ground, and the birds in the air follow after to pick up the worms, and we can say safely too that wherever we go with our trawls we plough the ground at the bottom of the sea. The fish cannot live upon the bait of the long-line fisherman, but wherever we plough the ground with our trawls the fish always come there after the worms that come up from the ground at the bottom of the sea, just as the birds of the air come after the worms which the farmer ploughs up when he ploughs his fields.

4848. Do you find then that in passing over the same ground a second time you are able to get as many fish in a draught as you did before?—Yes, and oftentimes more.

4849. Have you never found in your experience that you exhaust the fish on a particular ground?—No.

4850. Not on any part of the coast?—We never go back exactly over the same piece of ground in trawling; probably we do not go within a quarter or half a mile because the tide and the wind will not allow us to do so.

4851. But you never noticed any decrease even when you did go nearly over the same piece of ground?—No.

4852. In the course of your experience as a trawl-fisherman have you found practically that while the fish are more abundant they are at least as large now as they used to be?—Yes, we have never seen such a thing in Hartlepool this summer as a small haddock at all. The fish buyers will prove that. You can have the fish buyers to answer for themselves. The fish caught this season are quite fit for any gentleman's table in England.

4853. Do you find when you draw up your trawl net that many of the fish are dead or seriously injured?—Sometimes they are.

4854. What proportion on the average should you think were dead or injured?—Well, at times we get our net down two or three hours and sometimes it is

down six hours. The shorter the time it is down the more live fish we have in the net when it comes up.

4855. But on the average what proportion of the whole number of fish taken would be dead or injured by the trawl ?—Sometimes there may be one-third, and at other times none at all. I have seen the trawl nets come up when there was not one dead fish in them.

4856. What do you do with the dead ones when they come up ?—They are just as good as if they were alive.

4857. Do you bring all you can on shore whether dead or alive or injured when they come up, or whether they are small or not ?—Yes, all of them come on shore. What we call injured is perhaps not what you call injured. If a fish should be very much bruised we throw it overboard, that is the only thing it is fit for, but if it is dead without being bruised it is as well as if it was alive.

4858. Is there a large proportion injured in the way you speak of ?—No, and if you will allow me to speak, the long-liners' fish are dead when they come on board, and even the herring himself before he comes out of the net. You are aware that it is not because the fish is dead that he is condemnable, for he is as good as ever he was.

4859. Do you ever bring up any spawn in your nets ?—No, I never saw such a thing.

4860. Not in the nets ?—No, and I will put it to yourself whether, if it is like what it is said to be, it could be brought up in the net. The spawn was compared by the fisherman here who spoke of it a little while ago to something like sago—I think I heard that name mentioned. Now I ask you, would sago hang about a net when it was washing about in the water ? Can any gentleman suppose that when it is proved that the trawl nets are in the water a long time, and all the trawl-men say they may be in the water one or two hours, or six hours, anything like sago would hold together in that net until it was hauled on board ?

4861. At what rate does the net go through the water ?—Sometimes as fast as the tide, and sometimes only a mile or two an hour.

4862. Do you go so fast that the drag would prevent the spawn adhering to the net ?—As I understand the spawn of fish is naturally slippery and would not hold, and I repeat again that spawn would not hang to the net or anything else when it is washing through the water. No man can show it to me. I have a vessel qualified for anything, and I will take any disinterested man on board my vessel for a week or a month, and show him all the ins and the outs of the fishing. He will see the fish brought up, he will see all these points himself, and everything belonging to the fishing.

4863. Do you ever find the long lines of the line fishermen brought up by your nets or injured ?—No, I have been told by the long-line fishermen that it will not hold on to their lines if there is a smart breeze.

4864. Have you never brought up their lines ?—No, I never did.

4865. Have you ever known the long-lines injured by the trawl nets ?—Yes, once, and then I paid the man for it.

4866. Never but once ?—Only once, and he came to me as the man who did it, and I gave him another line.

4867. Do you fish on the same ground as the long-line fishermen ?—Yes.

4868. Do you not know that the long-lines extend over a distance of two miles sometimes ?—I know that there is a good length of line sometimes. A man just now remarked that we could see the buoys four miles off—the buoys of the long-liners, but the long-liners' buoys are only about as large as a hat.

4869. Have you ever injured the long-lines ?—No, except that once.

4870. Do you think you could pass over them and not injure them ?—Yes, I think I could get my nets right over them without any injury to them. I will prove it to-morrow morning any ways. I will go out with the long-lines, and if there should be a breeze of wind I will take my nets over the long-liners' lines and not hurt one hook on them. I am quite prepared in that case also, that any disinterested man shall come on board my vessel and see that, with a breeze up and my nets down, I will go over a long-line without injuring it.

4871. Suppose you had not a breeze, what would happen then ?—Then I should not get where they were. My net would not go down without a breeze. I cannot trawl my net without a wind.

4872. If you saw the buoys on the long-line fishermen's lines could you change your course with sufficient rapidity to escape them, or at all events with sufficient rapidity to prevent any injury being done to them ?—Yes, and I would do so rather than do any man an injury.

4873. Even when it was blowing hard ?—Yes, and I may say that I believe it is the desire of the trawl fishermen generally not to hurt their fellow creatures who follow another mode of catching fish ; I know it is so in my case.

4874. (*Professor Huxley.*) You were talking about the size of the haddocks just now ; what do you call a small haddock ?—Well, I should think that a haddock half a foot long would be a small one.

4875. Have you not been in the habit of getting haddocks even smaller than that in your trawl ?—No, not so small as that.

4876. What should you say would be a full sized haddock ?—Well, that is rather a puzzle to me. I have seen haddocks as long as that (*measuring a space of* 18 *or* 20 *inches on the table with his hands*), but I should think about a foot or 14 inches would be the average size of a full-grown haddock.

4877. Do you get them abundantly ?—We do. I can show you clearly that what these men say is not correct, for any man who calls himself a fisherman can tell at once by looking at the mouth of a fish whether that fish has reached its full growth ; and any buyer can tell, so you do not want to go to any fisherman to inquire about that.

4878. We were talking about spawn just now. It is necessary to remark on that point that the description of fish spawn which has been given is not a correct or accurate description. The substance which has been described is not fish spawn. The spawn of a herring is a very firm substance indeed, is it not ?— I beg your pardon, I think not.

4880. What do you call the spawn of herring ?—True it is that when it is in the belly of the fish it is solid and firm, but when it is shed out into the water it is all of a slippery soft substance like water and glue. That you will find is the nature of herring spawn, and the spawn of every other fish. Near spawning time, and under certain circumstances, if you squeeze the fish it runs from them like water,

4881. Did you ever squeeze the spawn from a fish about spawning time into a bucket of a water ?—I suppose if you go into a herringer's boat you will be quite satisfied.

4882–3. But with regard to the firmness of the spawn, you are quite correct in stating that the spawn when it comes from the herring is quite soft and sticky, but if you had ever taken the trouble to let it run into a bucket of water, and let it be there for 12 hours, you would then find it firm and hard and as stiff as a bit of leather ; it would stick to the bottom if I turned the bucket upside down ?—I know perfectly well that it would be after that time, but it would be dead.

4884. Herring spawn, when it is shed on the ground, would, after it got hard, keep in your nets as well as fish would, would it not?—Well, all I can say is that I never saw any such thing in my life. There is another thing upon which, if you will allow me to speak, I wish to enlighten you. Our forefathers' day is gone ; we do not live in that day. We are a race of fishermen now who are trying to progress with the times. We are doing so, and we are trying to do it ; but the long-line fishermen cannot do it. We could

HARTLEPOOL.

W. Bartlett.

29 Sept. 1863.

agree very well at one time, some 10 or 12 or 14 years ago, and we can agree all the time the herring season lasts, but we cannot agree afterwards, because in the smaller boats how can the men go and get their living. It is impossible to get it in small boats. But if they could get the vessels that we get, and go to sea like we do, they would get a living. We do not destroy the fish. We can at any time go into a strange or distant fishing ground, and when we catch good marketable fish we can carry them to the best market. But they cannot do anything of the kind; they are obliged to fish upon their own ground, and cannot go anywhere else. Let them get large vessels as we do, and supply every market as we do. But the small boats will never do that. Depend upon it the old plan must and will eventually go out.

4885. You consider that the trawlers have succeeded by introducing new and improved machinery into the mode of catching fish?—Yes, and by so doing they have condemned the old system.

4886. Do you think that the effect of introducing new and improved machinery into the business of fishing is something like the effect produced by the introduction of machinery into cotton spinning?—Well, I do not know about that, but we had to condemn the old mode of fishing because we could not get a living at it, and beyond that our lives were not as safe as they are in the larger trawling vessels.

4887. Have you ever found that the fish when they came up in the trawl had any bad smell about them?—No.

4888. You have never noticed such a thing?—No, never.

4889. Have you ever eaten trawl-fish?—Yes, sir.

4890–1. Have your smack's crew eaten it also?—Yes, frequently.

4892. You never saw any of the men ill in consequence of eating it?—No. There is another point on which I wish to say a word. I never saw a dead man come up in a net, as was said just now.

4893. Did you ever hear of such a thing as a dead body being brought up by the trawlers in their nets?—Well, there may have been a part of a dead man brought up. I think I have heard of that.

4894. Part of a dead man, you say, was brought up?—Yes, and I have known of a dead man coming up with the hook on a long line as well.

4895. A dead man could not take hold of a hook, could he; how was that?—Why, a hook could catch in a man's fingers or arms or other parts of the body. In fact, I saw one come up, so that a dead man is just as liable to get hold of a hook as he is to be brought up in a trawl net.

4896–7. You do not think that it is a common occurrence?—No, not one man out of a hundred could ever say that they saw a dead man in the trawl.

The witness withdrew.

G. Pearce.

GEORGE PEARCE called and examined.

4898. (*Mr. Caird.*) You are a trawl-fisherman, I believe?—Yes.

4899–900. What part of the coast do you hail from?—From the port of Hull.

4901. How many years have you been engaged in fishing from Hull?—Eighteen years.

4902. What was the number of trawl-boats hailing from Hull at the time you began?—About 40.

4903. Do you know what the number may be now? Something like 300.

4904. Are they larger vessels now than they used to be?—Yes, considerably larger.

4905. Do you make as good a living now as you did then by trawl-fishing?—Equally as good.

4906. Do you make a better living, do you think?—Yes, of the two I think we do.

4907. Has not the price of fish very much increased during the last 18 years?—No, it has rather diminished if anything.

4908. Do you not get so much for codfish now as you did 18 years ago?—No, we find fish very cheap indeed, and we have frequently left one market and taken our fish to another, in consequence of the market being so bad, there being so much fish there; and we have found many times that when we have gone to another things have been no better, in consequence of the quantity of fish which has been caught, so that we have been obliged to get what we could for them.

4909. Can you tell us from your recollection what the price of fish was 18 years ago in Hull?—About that time it might run from 10*s.* to 12*s.* a pot. Sometimes it was more, and sometimes less.

4910. What would it be on the average 18 years ago?—Perhaps it might be 14*s.* a pot.

4911. What might it be 10 years ago?—Something about the same price, but in bad weather the price rises very much. I have known it as high as 2*l.* a pot.

4912. What did it average last year?—From 10*s.* to 14*s.* a pot. Sometimes more, and sometimes less.

4913. So that the average price now is just about the same as it was 18 years ago?—Yes.

4914. You do not then attribute your better circumstances so much to any increase in the price of the fish as to an increase in the quantity of fish that you bring on shore?—Yes; for instance, in former years when we first went trawling, such fish as haddock and plaice were very little thought of. When I first went out we used to get a quantity of live plaice, and the skipper said, "Boys, heave them overboard." I was astonished, but the fact was there was not any market for them. Now, however, everything is sent to market but the very small fish.

4915. Now you keep more fish than you used to do?—Yes, and more money is made a considerable deal than used to be made then.

4916. The only fish now thrown overboard are the fish that are not marketable?—No, not any, except what my friend spoke of, such as gurnet and dab.

4917. Are they not given to the apprentices, now?—They are when we come in every day, but when we go out of Hull we go out for five or six weeks, and what we catch in the night we put into baskets, and put the baskets on board other smacks, and they take them on shore for 1*s.* a basket. That has been the reason why so many fish get into the manure houses. There were 50 manure houses formerly as a receptacle for small and bruised fish, and I can state that there never was a small fish of any kind put into the manure houses without its having been condemned in consequence of the bad weather. There are many times when we take the fish out at sea sometimes 120 or 140 miles off in the Silver Pits. Even when the weather seems favourable I have been four or five days away and never expected to get to Hull again. The consequence is that the fish have been condemned and used for manure.

4918. But when you are far out at sea and have to send the fish home, you are not in the habit of sending home the fish that are not marketable?—Only gurnets and dabs. We never have done so with respect to haddocks, which is the chief fish we catch at such times.

4919. In bringing up the trawl what quantity of the fish in the trawl net are usually injured?—It all depends upon the weather. If I have had a trawl in the water as long as 10 hours, and sometimes I could not get it out for the weather sooner, we should have a good many injured and dead, on account of the washing about in the water. Sometimes we have it down three, four, five, and six hours, but we generally consider six hours is a fair haul. There are sometimes as much as one third of the fish dead or injured. There may be more or less, but in no case is the fish condemnable when they come up in the net.

4920. Are they never so much injured as to be unfit for food?—No, I think not.

4921. Then they are all marketable provided you can get on shore while the fish will keep good?—Yes, and as a general rule there is no such thing as having bad fish brought on shore, because we do not go off above nine or 10 miles. We haul up in the morning, and have the fish ashore the same day.

4922. Do you ever have any spawn brought up in your net?—No; I do not know what the meaning of spawn is, to see it in the net. I have heard of 40,000 tons of spawn being destroyed. I can only say that I have held what they call the spawn in my hands, and I certainly do not think that that kind of stuff would keep in the nets when they were going through the water.

4923. Do you agree with the previous witness that the fishing grounds you frequent yield as much fish as they formerly did?—Yes.

4924. And that you are not impoverishing the ground by going daily to the same place?—No; I got last night 200 stone of haddocks.

4925. Are they as good in respect to size as they used to be?—Yes; they are much larger than those that were caught last year.

4926. Have you caught many cod?—No.

4927. Do you catch many turbot?—No. I am sorry to say we have been six or seven weeks and have not had 10 turbots.

4928. What is the reason that you do not catch them?—I really do not know, except it is that the Hartlepool men catch them in the nights, and the smacks come and take them away to London.

4929. They said they used to get them some years ago, but do not now?—All that I know is that we never catch any quantity of turbot in the trawls. We may sometimes catch two or three. I should like to see one or two now and then. It make's a morning's work look a little better sometimes than it would otherwise do. With regard to the turbot at the mouth of the Tees, my friend there behind catches baskets and baskets full of turbots not larger than plaice, and little smelts, and brill.

4930. How does he catch them?—By little boats and trawls; some of the little boats keep small trawls on board.

4931. How do you know that?—The fish buyers tell me so.

4932. Are any of those fish buyers here to-day?—I saw one of them just now in my house. I am sorry to say that he was in a sad condition last year from these men refusing to let him have fish in the winter because he bought smack-fish; there are others now in this place who have continual orders for fish but they must not buy smack-fish.

4933. Why must they not buy smack-fish; these people you say have orders?—Yes.

4934. Who do they get their orders from?—From those who supply the London market and the Manchester and Leeds markets.

4935. Do they not want to buy the smack-fish?—Yes, they want to buy the smack-fish, but they cannot do so, because if they buy the smack-fish the other fishermen will not let them have any of their fish in the winter season when there are no smack-fish here; it is nothing in the world but a bad feeling.

4936. (*Professor Huxley.*) Did you ever get a dead man brought up in your trawl?—No, I never did.

4937. Did you ever know of any one who did?—Yes, I think I have heard of one who did, but I forget his name.

4938. Have you ever in your experience injured the lines of the long-line fishermen?—Never.

4939. Can you well help coming across their lines sometimes?—No, I think my friends shoot their lines very early in the morning, and consequently they have no light; we may be going along at the same time not very far off, and I do not see how we can very well avoid them; in the day we can, but I do not see how we can in the night. I don't see that that has anything to do with the trawling.

4940. No, that is quite true, they are two entirely different and distinct questions, and I will ask you about both. Did you ever notice that the fish had a bad smell when they came up?—No.

4941. You do not think that the trawling gives them a bad smell?—No, my friend has stated that the trawl-fish would not keep so long as the line-fish, but he is quite mistaken, for I have kept them longer. I will tell you the reason why they will keep longer; it is because the slime on the line-fish makes them go sooner, whereas in the trawl-fish the slime is washed off; that is the evidence of the buyers.

4942. Your fish commonly goes to Manchester and other markets, does it not?—Yes.

4943. Did you ever hear any complaints from the buyers that the trawl-fish would not keep?—No, never.

4944. Have you ever brought fish to market in any place where long-line fishermen bring their fish?—Yes.

4945. Where?—I was at Sunderland three weeks ago, and I read a statement in Mr. Crick's writing that the skate was very scarce. I can tell you what occurred to me. I was off the Scotch coast managing some fishing smacks on the ground there, unfortunately we caught very little; my brother mates caught only one, and we caught four or five skate. We did not land at any Scotch fishing port, but we landed at Sunderland on Saturday morning. It appears I asked too much for the skate. You know we are sometimes like Jews. They said, "Don't talk like that, we have "had so many skate this year that they have been "almost given away."

4946. When did you catch the skate?—On Friday night. Well I asked some of the men there and they said that there were so many skate caught and brought to Sunderland that they were scarcely worth anything.

4947. Where were those skate caught that were taken to Sunderland?—They were catched on the Dogger Bank. You will have evidence to show that the hook-and-line boats get quantities of skate.

4948. I want to know whether you have been in the habit of taking your fish to a port where the fish were taken which were caught by the long-line fishermen and where consequently they competed with you?—Yes.

4949. Where have you done that?—At Hull.

4950. And did you find that you could get as good a price for your trawl-fish as the long-line fishermen could get for their fish?—Yes.

4951. Have you never had your fish refused in consequence of those which were offered in competition with them being long-line fish?—Never, if our fish are in good order. If we get there before our fish is bad we find that they have quite as good a chance of selling as any. I do not know what England would do if they had only to depend upon the long-line fish.

4952. Have you had any complaints made by the buyers of your fish that the gall bladders were burst?—No.

4953. Do you gut your fish on board?—Yes, sometimes, and one may sometimes burst the gall bladder if he does not understand the proper mode of gutting.

4954. But the gall bladder will not burst in any fish before they are gutted?—No.

4955. Have you never seen a fish stained green in consequence of the bursting of the gall bladder?—No.

4956. Have you often eaten trawl-fish?—Yes, many and many a time, and so have my crew also.

4957. Have you never suffered from illness in consequence? We are informed that it is unwholesome?—No, I never suffered the slightest illness from eating it.

4958. Do you know who buys the small fish?—Young women and lads buy it, and go hawking it about from door to door.

4959. Have you a good market for it?—Yes, it fetches from 1*s.* 6*d.* to 2*s.* per hamper.

HARTLEPOOL.

C. Pearce.

29 Sept. 1863.

4960. Is there generally a pretty good market for it?—Yes, at the time that the herrings are not about there is, but when there is a great quantity of herrings about the people do not care for it.

4961. But at the time when there are no herrings about there is a pretty good market for it?—Yes.

4962. When the herrings are about, are they as ready to buy as they are before?—No. This morning out of 20 hampers of fish we had only two small; that is all we had out of the lot.

4963. Were they all sold?—Yes.

4964. Would the poor people who buy these small fish be able to obtain fish at all if the small fish were not brought to them?—It is according to the weather. If my friends the liners cannot get in then of course they would have no fish at all if it were not for the trawled fish.

4964*a*. But the better kind of trawled fish is rather dear, is it not?—It depends upon the weather.

4965. Is the trawled fish cheaper?—Yes, it always goes cheaper.

4966. If they could not get these small fish, would they be able to buy the larger fish?—No, the small buyers have not sufficient capital to enable them to speculate in the large fish.

4967. Then they would not buy fish at all?—No. As regards destroying the small fish, I have a man who sails with me who lived at Withernsea. He says that they frequently caught 20 stone of fish on a line, and that 10 of it was small. I mentioned that to a fish buyer at Hartlepool, and he said that there were sometimes more small than that. He said that the present people caught a great deal more small fish than they did before. Like the disciples of old, we cast in our nets and we gather what we can. I can make nothing of this cry against the trawlers, except that it is a nasty bad feeling they have among the line-fishermen.

The witness withdrew.

JOHN HARRISON called and examined.

J. Harrison.

4968–9. (*Mr. Caird.*) Are you a fishmonger?—Yes.

4970. Have you long been a buyer of fish?—It is now 14 years since I commenced for myself.

4971. Do you ever buy any trawled fish?—Yes.

4972. Have you been in the habit of buying it regularly?—Yes, until this year.

4973. You have bought none this year?—No.

4974. Have you any complaints to make of the quality of the trawled fish?—I have just given to that gentleman (*the secretary*) the letters which I received from the parties to whom the fish was sent.

4975. Three letters have been put in from which it would appear that some fish that you sent to Newcastle at different dates was condemned as being unfit for human food?—Yes.

4976. Was it trawled fish?—Yes.

4977. Has it ever happened that you have sent any fish caught by line that was equally condemned?—No, never.

4978. Were the fish in a bad state when you saw them?—The smack was in the day before I bought the fish and sent it away. I hardly considered that it was bad, but those are the letters that I got respecting it.

4979. Had it been stormy weather?—No, it was close weather, and the smack was in the day before.

4980. Then they had been kept overnight?—I sent them the next morning. The smack was in the day before; I bought them the day before, and sent them away the next morning to Newcastle.

4981. It is not unusual, is it, if fish is kept for a time, that it should become unfit for human food?—It ought not to turn bad in one day. The fish caught one day and sent away the next ought to be good.

4982. Have you bought line-fish and trawl-fish at the same time?—Yes.

4982*a*. Have you made any distinction in the price paid for line-fish and trawl-fish, if equally fresh?—Yes, there is a distinction in the price. Sometimes we would buy two or three cobles of fish and divide them among the customers.

4983. You have not found that the customers have made any complaints of the mixture?—Sometimes they have.

4984. But they were so little distinguishable that you thought you might do that?—Sometimes they have been rather worse than at others. Sometimes they have been alive, as the saying is.

4985. When they are alive, are they as good as the line-fish?—Of course they ought to be.

4986. Is there any difference?—There should not be any difference.

4987. Is the line-fish alive when it is brought ashore?—Yes, part of it.

4988. Is a large proportion of it alive?—No, not as a general thing, unless it is plaice or soles. With regard to the white fish, the cod, haddock, or such like, it is very seldom that they are. We may have an odd one or two alive sometimes.

4989. (*Professor Huxley.*) Do you mean that the trawl-fish when brought ashore are commonly dead and unfit for food?—No; I have seen them come on shore very fresh indeed, but sometimes I have seen them brought on shore very bad indeed.

4990. Have you on any other occasion sent trawl-fish to the market and had it rejected, except in the three cases you have brought under our notice?—I have sometimes sent fish and had it found fault with, but they have always paid for it except in these cases.

4991. Why was it found fault with?—They thought it was rather old. They said they would prefer coble fish if they could get it.

4992. Is that because it had been kept for some time?—Perhaps it may have been kept a day or two before the trawlers came in.

4993. Suppose there came ashore trawled fish and hooked fish, caught at the same time, do you think that there would be any difference in the length of time those fish would keep?—Yes.

4994. Which would keep the longest?—The hooked fish of course.

4995. Why would it keep longer than the trawled fish?—The hooked fish bleed, but the trawl fish is bruised and knocked about, and never looks so well as the hooked fish.

4996. Is that so; have you tried the experiment?—Yes; I know the difference between hooked fish and trawled fish, and I know that hooked fish will keep longer than the other.

4997. Have you had fish which you knew had been caught at the same time, and have you kept them and found that the trawled fish became bad sooner than the hooked fish?—The trawlers have gone off the same night as the line-fishermen, and I have bought fish of both the next morning, and have found that there was a great difference.

4998. How much difference?—Perhaps there might be a day.

4999. A day's difference?—I think that there might be a day's difference.

5000. Have you often observed that?—Yes, many a time.

5001. (*Mr. Caird.*) During the time they are at the herring fishery is there a supply of white fish other than herrings brought in by the line-fishermen?—Sometimes a coble will go off; perhaps one or two will, and they will come in with a few haddock.

5002. But they do not as a practice follow the line-fishing at the same time as the herring-fishing?—No, only a few old men will do it.

5003. Do the trawlers bring white fish ashore while the herring-fishing is going on?—Yes.

5004. Then, notwithstanding that the line-fishermen

do not go to the white-fishing while the herring-fishing is going on, the market is still supplied?—Yes, the market at West Hartlepool is. We should not get much white fish unless it were a few mackerel or soles otherwise. We have a few soles brought in in the small cobles.

The witness withdrew.

JOHN HYSLOP BELL called and examined.

5005. (*Professor Huxley.*) Are you acquainted, Mr. Bell, with the history of the circumstances to which a fisherman alluded in his evidence to-day in reference to the dispute with the Tees Conservancy Commissioners?—I was not present this morning when the statement was made, but I was living in the district at the time the facts transpired, and I was familiarly acquainted with them.

5006. Will you be kind enough to tell us what the circumstances were?—About the end of October 1859 a placard was circulated in this district intimating that the Tees Conservancy Commissioners had acquired parliamentary powers by which they had become the sole proprietors of the fishing and the rights of fishing in the River Tees. It also defined the boundaries of the River Tees by a boundary different from that which had been popularly understood, fixing it at some distance seaward. The placard further stated that from and after a day specified any person fishing in the River Tees without a special licence from the Tees Conservancy Commissioners would subject himself to particular penalties. Reference was also made to an Act of Parliament passed in the previous year as the authority for these regulations. On referring to that Act I found that it was a private bill which gave authority to the Tees Conservancy Commissioners to purchase all the rights of the fishery or fishing in the River Tees by agreement or compulsorily. A schedule was attached to the Act which specified the rights of the fishery that had to be purchased by agreement, but there was no specification contained in the Act as to the rights that were to be purchased compulsorily. This placard, which was issued in October 1859 was in reality the first intimation to the public that the Tees Conservancy Commissioners were assuming themselves to be the proprietors under the Act of the public rights in connexion with the fishery.

5007. Had the Conservancy Commissioners made no proposition to the fishermen here to induce them to give up their rights of fishing?—None whatever. The placard also stated that a certain form of licence would be granted, and on referring to the form, a copy of which I will put in, I found that the licence was in reality a surrender of rights. It was not a licence at all, but a promise from that time on the part of the fishermen to surrender their rights. The amount to be charged for those licences was generally very small, but had the fishermen purchased them they could not have gone to the fishery again without purchasing a right they had surrendered. Attention was drawn to the subject, and several public bodies undertook to defend the fishermen from what they regarded as an imposition, while several legal gentlemen undertook to protect their rights gratuitously. The next step that was taken by the Tees Conservancy Commissioners was the passing of certain byelaws which they had power to make. In one of these an attempt was made to establish a licence, certain of the byelaws being definitions and assumptions based upon the surrender of the fishermen's rights. The passing of these byelaws was opposed before Mr. Justice Williams, who struck out every one of them that contained such an assumption in it, or described the Tees Conservancy Commissioners as the proprietors of the rights of fishing. Perhaps I may be allowed to explain that the reason this was of importance to Hartlepool was that the Hartlepool fishermen had been in the habit for a long time of resorting to the River Tees for mussels to use as bait. The corporation of Hartlepool were originally the proprietors of the harbour under a charter from King John, and they found, under a charter subsequently granted by Queen Elizabeth, that a certain place called "Black Shore" at the mouth of the Tees (which derived its name from the fact that it was black with mussels) was a part of the ancient port. On that ground, when the Tees Conservancy Commissioners gave notice last November of their intention to introduce a bill into Parliament to enable them to purchase all the rights of fishing in the River Tees, and when they specially named in the bill they introduced that they wished to buy prescriptive rights, the corporation gave notice of opposition. The ground upon which they did that was that they possessed a prescriptive right which had not been terminated by any subsequent legislation. The result was that the Tees Conservancy Commissioners at one stage in the progress of their bill in Parliament, either immediately before or immediately after the second reading of the bill, withdrew all the fishery clauses, so that at the present time the question stands in this position: The Act of Parliament upon which the Tees Conservancy Commissioners based their claims passed in 1858; it was referred to in the placard issued in October 1859 as containing penal enactments against the fishermen in this neighbourhood who were in the habit of resorting to the Tees for bait, and clauses giving the Conservancy Commissioners power to impose penal restrictions upon the fishermen when pursuing their ordinary course of employment; and yet the fishermen, having discovered that the claims of the Commissioners were a mere assumption, and fortified by the decision of Mr. Justice Williams on the byelaws and by the decision of the Commissioners themselves not to press the fishery clauses introduced in their bill of this year, are daily breaking a law which is nugatory.

5008. If the Act of Parliament had already given to the Tees Conservancy Commissioners the powers they claimed how is it that they felt it necessary to press the matter further before Parliament?—The Act gives the Commissioners power to purchase by agreement or compulsorily. On referring to the Act it was clearly seen that they had only acquired the right to purchase, and had they succeeded in inducing the fishermen to purchase licences from them the fishermen in point of fact instead of buying would have been sold.

5009. There are two questions involved in the matter, so far as I understand it. In the first place there is a doubt as to the propriety of the measures taken to secure the transference of the rights of the fishermen, and the second point is whether the regulations laid down by the Commissioners were in themselves hurtful or not?—Quite so.

5010. Are you acquainted with the regulations they attempted to lay down?—The fishermen of this place were themselves of opinion that they would no longer be able to get bait if the regulations drawn up by the Conservancy Commissioners were enforced.

5011. One of the fishermen stated to us in his evidence this morning that in his belief what was required of them was that they should pay 1*l.* a year for a licence, and that certain regulations should be enforced to prevent them from taking mussels less than a certain size?—That was one part of the regulations. Another was that the fishermen should not raise mussels of any kind except at particular times and from particular situations, and that such times and situations should not be settled for the whole season beforehand, but should be defined arbitrarily by bailiffs so be appointed by the Tees Conservancy Commissioners and in their discretion. The result would have been that if the bailiff wished to favour the fishermen of any particular locality, or wished to make a private fishing for the benefit of the river and send fish off to the market in London themselves, as a means of supplementing the revenues of the river,

HARTLEPOOL.
J. H. Bell.
29 Sept. 1863.

of course they could have done so and could virtually have excluded all other fishermen from the place.

5012. Then I understand you to say that the regulations which the Tees Conservancy Commissioners were desirous of enforcing were partly to keep up the supply of bait, and were partly in the nature of commercial restrictions?—Yes, just so.

5013. As far as the regulations in reference to keeping up a supply of bait are concerned, do you think they were unwise or inexpedient? Take, for instance, the regulation that no mussel should be taken under a certain size?—I have not sufficient practical knowledge upon a subject of that sort to enable me to answer the question, but I have been informed by the fishermen that they would never think of taking mussels under the size fixed by the Commissioners as they would be of no use to them.

5014. In the course of our inquiry we have had great complaints that mussel beds have been unwisely and wastefully fished, particularly by strangers, but of course that is a question altogether apart from the legality of the proceedings of the Tees Conservancy Commissioners?—Quite so.

5015. Then in reality the whole question is in abeyance at present?—Yes, but the letter of the law still exists.

5016. But it is permissive?—Yes, that is all.

5017. It gives the Tees Conservancy Commissioners the power of purchasing if they can?—Yes.

5018. Then in reality the fishermen are fishing without breaking the law because the conditions of the Act of Parliament have never been complied with by the Commissioners themselves?—In one respect I believe they are breaking the law.

5019. In what way?—The Tees Conservancy Commissioners have carried out some of the other provisions of the Act which enabled them to appoint bailiffs and every act of disobedience on the part of the fishermen to the orders of these bailiffs is a violation of the Act of Parliament.

5020. But the Act could give no power either to the Commissioners or to their bailiffs unless it was fully carried out?—No, except inconsistently. It gives the Commissioners power to appoint an officer to do a particular duty and if there are no duties to discharge then of course there is an inconsistency.

5021. If the Commissioners themselves have not completed their contract then of course their bailiffs can have no power and that part of the Act becomes void?—I certainly think so.

5022. And the fishermen are left at liberty as the Act stands?—Yes.

The witness withdrew.

(*Mr. Caird.*) We have now examined the whole of the witnesses whose names appear upon the list handed in. If there is any fisherman present who wishes to add anything to what has been said, or is desirous of contradicting any of the evidence given to us, we shall be glad to hear him.

There was no response, and the inquiry was adjourned to Wednesday, September 30, at Staithes.

Staithes, Yorkshire, Wednesday, 30th September 1863.

PRESENT:

JAMES CAIRD, Esq., M.P. (Chairman). | Professor HUXLEY, F.R.S.

STAITHES.
J. Fell.
30 Sept. 1863.

JAMES FELL called and examined.

5023. (*Mr. Caird.*) Have you long been a fisherman here?—Yes, I have been a fisherman for 40 years.

5024. What are the principal kinds of fish you find on this coast?—There are a great many different kinds of fish got here.

5025. Which kinds do you find chiefly profitable to you as a fisherman?—Well I should say herring, haddock, cod, ling, halibut, skate, and turbot.

5026. Is the herring fishery or the other white fishery the most profitable to you on the whole?—We fish mostly for the other sort of fish. We have a season for the herring-fishing. We have just closed the inside fishing for the herring season.

5027. The other white-fishing lasts longer?—Yes.

5028. Do you find that on the whole it yields an amount of money in the course of a year larger than you obtain during the short season the herring-fishing lasts?—Yes; the long-line fishing with many people lasts all the year round.

5029. In the course of your experience as a long-line fisherman, have you observed whether the catch,—the average catch,—of a boat is increasing or diminishing?—It has greatly diminished in my time.

5030. Can you compare it with any time, say 10 or 20 years back?—I don't think there is one fourth or one fifth the catch now compared with what was the catch 10 or 15 years ago.

5031. How is that; are the same number of boats employed?—I have known 14 or 15 boats fish from this place when I was young, and now there are 16 or 17.

5032. Then during your time there has only been an increase of three boats?—Yes, but before my time there were 18 boats. I have heard old men talk of a time when there were 18 boats.

5033. The number of boats then has been pretty stationary?—Yes, sometimes we have had rather more than at others.

5034. Are the boats manned by the same number of people who used to man them?—Yes.

5035. Are they about the same size?—Yes, perhaps a little larger.

5036. Do they carry more lines, or do they carry about the same number of lines?—About the same.

5037. Speaking of 20 years ago, what would you consider an average catch of fish then?—In how long?

5038. In one day's fishing say?—Well, sometimes we got a good catch, and sometimes we got very little.

5039. Take a month's catch?—We generally go for a week.

5040. Then 20 years ago what would you consider an average catch of fish for a week?—I have been going for a week and I have brought 700 or 800 cod ashore, a ton of halibut, and a great number of skate and haddocks.

5041. Has that been in one week?—Yes, and other boats have got the same number as mine. Now we can hardly get any fish on the same ground close to the Dogger. The smacks are there now, and they have so trawled over the ground that they have ruined everything about there, where we used to get the most fish; where, as I have just told you, we have been catching a ton of halibut, besides other fish; but now we have quite abandoned the ground upon which we got that quantity, as we find we can't get any at all.

5042. Then do you fish on different ground now?—Yes, we were obliged to leave that ground because we could catch no fish. If we did happen to be fishing there the trawlers came amongst us and would take

STAITHES.
J. Fell.
30 Sept. 1863.

all our lines away. There were so many there that we could not keep clear of them.

5043. Then I understand you to say that you don't fish now where you did 20 years ago?—No, we go now more to the northward.

5044. Then you have changed your ground altogether?—We never go where we used to catch so much fish.

5045. Twenty years ago you were in the habit of going there?—Yes, all the fish we caught came from there then. All the salt fish we cured came from there then.

5046. You have told us how much you could catch 20 years ago, as a long-line fisherman, in a week, now tell us how much you are able to catch now?—I never see a fisherman get more than eight or nine score of cod now, while we use to get 600 or 700 frequently.

5047. How is it with regard to other fish?—There has been a trifling falling off with regard to other fish, but nothing in comparison to the falling off in the catch of cod.

5048. With regard to the price paid for fish now as compared with what it was formerly, what would a week's fishing be worth 20 years ago; what would be the value of your fish?—We sold it for various prices. It is hard to tell what the average would be, but fish was then not one fourth part of the price it is now.

5049. Can you not tell us how much a week's fishing on the average would give you 20 years ago in money?—Do you mean a good week?

5050. No, take a fair average week?—We used when we had got a good catch to get 20*l.* We used to sell the boat's load for 20*l.* a week.

5051. What would you get for an ordinary week's fishing?—From 10*l.* to 12*l.* or 15*l.*

5052. What would you make out of an ordinary week's fishing now?—About 15*l.* or 20*l.* when we get a good middling catch.

5053. Then there is not much difference in the value of a week's fishing to the fisherman compared with what it used to be?—The fish sell so much higher now.

5054. The difference is in the increase of price; then the loss falls on the public; the public have to pay more for their fish?—Yes.

5055. Has the falling off you spoke of in the quantity of the fish been in any particular kind, or has it been general?—It has been general among all sorts of fish, I believe.

5056. Has there been any falling off in the size of the fish as well as in the quantity?—Yes, they are never so big as they used to be.

5057. You were in the habit of getting larger cod than you do now?—Yes, they were larger a good deal.

5058. What would be the average weight of cod 20 years ago?—They were larger than they now are. I have seen cods weighing 4 stones brought ashore; but we very rarely see any like that now.

5059. With regard to haddocks, was the size of the haddock larger then than it is now?—They have greatly diminished in size. The trawlers have cleared millions of them away; they have destroyed the haddock more than any other fish.

5060. Is there any fish more than another that you have ceased to catch on this cost?—Yes, if there be any at all, I should say it is the haddock.

5061. Is this a good place for turbot-fishing?—Yes, it is a good place for all sorts of fish.

5062. Do you get as many turbots as you used to get?—We get a deal of halibut.

5063. You still get a deal of halibut?—Yes, but not one fourth we used to get.

5064. What about the turbot?—When we shoot bratt nets we get a good few, but not one quarter the quantity we used to get. I have known 7 score got in one haul. Now they reckon 14, 15, or 20 a great haul.

5065. Is there any particular part of this ground upon which you find the quantity of fish has greatly diminished?—Do you mean inside or outside?

5066. Both.—Well, at the outside where we used to get so much there is none now. I mean off the Dogger Bank. With regard to the inside fishing, I have been catching a thousand haddocks a day, but now we can't get above 30 or 40. Formerly, in a small boat, I have known them bring ashore from 800 to 1000 in the course of an hour's fishing.

5067. Is that what you call "inside fishing"?—Yes; now they will not get more than 30 or 40 on the same ground.

5068. Speaking of the ground outside, do you refer to the Dogger Bank?—Yes, where smacks go now.

5069. Were you in the habit of going in your open boats to the Dogger?—No, we always went there in decked boats.

5070–1. Have you many decked boats here?—Yes, you saw one come in to-day.

5072. How many of these decked boats have you?—Seventeen.

5073. Do I understand you to say that they go to the Dogger Bank now?—No.

5074. Why not?—Because the smacks have ruined the ground; they would catch nothing if they went.

5075. Then are there big boats in the long-line fishing?—Yes, they start fishing in February and they continue until July with the long-line.

5076. But you don't go to the Dogger Bank now?—No; at the edge of the Dogger where fish used to be so plentiful there is nothing to catch with the long-line now.

5077. What do you attribute the falling off to?—To nothing but the smacks.

5078. How do they do any injury?—They kill all the young spawn.

5079. Have you ever seen a trawl drawn up to the surface?—No, but I have heard the smack men talk of it.

5080. What do you attribute the falling off in the inside fishing to?—To the smacks; because the fish breed outside, and they can't come in.

5081. Do smacks come inside?—Yes, close to Staithes, within half a mile; they come where we got the haddocks, and we can't get any since they came.

5082. Do they do you any injury by getting foul of your lines?—They would do if they came in contact with them; but we generally get our lines out when we see them coming.

5083. Then you don't complain of the damage done to your lines by the smacks?—No, but at Scarborough and Filey they dare not shoot their lines for them.

5084. Have you altered your mode of fishing during the last 30 or 40 years?—No, but our gear is superior to what it used to be, and still we catch less fish.

5085. In what way is it superior?—Our nets and lines are finer.

5086. How long is it since you noticed this particular decline in the fishing?—About 20 years ago. We never noticed any falling off in the North Sea till the trawlers came.

5087–8. Has the catch of fish been gradually decreasing?—It has been gradually getting worse during these last 30 years.

5089. Is it worse this year than it was last?—Yes, and it will wear out altogether if these smacks are not stopped.

5090. But have you not variable seasons in fishing?—Not on the ground-fishing—what we call "line-fishing."

5091. What sort of bait do you use for your lines?—Generally mussels or flitters.

5092. Have you a supply in this neighbourhood?—No.

5093. Where do you obtain them?—We get them from Boston Deeps.

5094. You have none on your own shores?—No.

5095. Does it cost you much in a season to obtain bait?—We pay 9*d.* and 10*d.* a basket. We call a bushel a basket.

5096. How many will a boat use in the course of a year?—Each boat uses a great many mussels in the

STAITHES.

J. Fell.

30 Sept. 1863.

course of a year. The big boats have six men, and the small ones have three.

5097. Is the price of mussels increasing?—No. A man will use 3*l.* or 4*l.* worth.

5098. Do you mean a boat or a man?—A man.

5099. Then how many men are there in a boat?—Six men at a time.

5100. Then that would be 18*l.* or 24*l.* for bait?—Yes.

5101. Has the price increased or diminished?—It is much about the same.

5102. Do you find you have a sufficient supply for all your wants?—Yes, we get plenty when the water permits.

5103. You don't suffer any hardship in your fishing for want of bait?—Sometimes we do when we can't get them. Occasionally the weather will not permit the boats to come here.

5104. Are you deprived altogether of your fishing then?—No, we get limpets on the rocks, and we use them, but they are not so good as mussels.

5105. Is there anything else but the smacks to which you attribute the falling of in the fishing here?—No, I have never thought of anything else.

5106. Is there any ballast laid off this shore in any way?—No. I have been catching a thousand head of cod myself in the course of a morning within sight of Staithes. Now we seldom see more than two or three score brought ashore. There has been more this morning than we have had for some years. I have been catching a thousand head, and there have been men who have been catching more than that in the big boats.

5107. Is there a good fishing for crabs and lobsters here?—Yes.

5108. Is it increasing or diminishing?–Diminishing.

5109. In what kind of shell-fish is the diminution most noticeable?—In both kinds. There are not as many as there used to be by a great way.

5110. What do you think is the cause of that?—I believe that the smacks kill everything, and I suppose that they kill shell-fish too.

5111. Are there any more fishermen engaged in this village in fishing crabs and lobsters than there used to be 20 years ago?—Yes, I believe there are more than there were 20 years ago, but there is not half the quantity of lobsters and crabs caught that there used to be then.

5112. Then the quantity of fish caught has not been proportionate to the increased number of men?—No, there are not half the crabs and lobsters caught that there used to be.

5113. With regard to the herring fishery, do you find it has been increasing or diminishing?—They are curious to judge. Sometimes there will be a middling season and sometimes a bad one. They fly on the top of the water. They are different altogether from ground-fish.

5114. But has the herring-fishing diminished?—There are not one quarter the number of herrings that there used to be. We have much better gear to catch them with than we had formerly. Notwithstanding that we can't catch anything like the same quantity now.

5115. Are there the same number of boats in the herring-fishing that there used to be 20 years ago?—I think there will be rather more boats engaged.

5116. How many more?—Only two or three; there is little difference.

5117. Do you not think the shoals of herring that come upon your coast are as large as they used to be?—They are not a quarter as large as they used to be. I have known them extend as far as the eye could reach, and every boat engaged would get 48 or 50 last of herring. Now it is not one in 20 that hits them. There are certainly more craft on the coast than there used to be, but not one in 20 hits the fish. About 20 or 30 years ago all the boats would get plenty.

5118. Do any French fishermen come upon this coast?—Yes.

5119. Do they disturb your fishing?—Yes, we cannot fish where we used to fish.

5120. Do they come within the three-mile limit?—Yes.

5121. Do they pay no regard to the restriction in that respect?—No, wherever the fish are they will be among them; they will come right close on to the land; we cannot drive with them, their nets are so much stronger and thicker than ours; their warp is so big that it would tear our nets to pieces.

5122–3. But your boats are as big as theirs, are they not?—No, we have no boats as large as theirs.

5124. Then you find you cannot fish with safety along with the French boats?—No; we are obliged to give them a wide berth, and we often miss the herrings altogether through them.

5125. Do you observe any particular time at which to shoot your herring nets; do you shoot them about sunset?—Yes, about sunset.

5126. Do the French fishing boats observe the same time?—They shoot when we do, but they often take the ground from us. We never think of shooting our nets until about sunset, and they go where they think the herrings are in order to get the place from us.

5127. Do you find that the largest quantity of herrings is found within the three-mile limit, or beyond it?—Sometimes they are within the three-mile limit, and sometimes beyond it.

5128. But taking the season as a whole, are they more within or without the limit?—When a body of them gets together, they are generally well in.

5129. Then it is of great advantage that you should have protection to the fishing, and that the French boats should be kept without the three-mile limit?—Yes.

5130. Would it be of advantage that the Frenchmen should be entirely excluded from that three-mile limit?—Yes.

5131. Has anybody ever come round to give you protection?—I have never seen a boat this season; there is one that comes sometimes.

5132. When did you see any interference with the Frenchmen on your shore?—When did I see anybody interfering with them?

5133. Yes, to give you protection?—I have never seen anyone there this season.

5134. Was there anyone there last season?—I think there was.

5135. Did they do any good?—I never saw them do any good; the Frenchmen were always upon the ground wherever they wanted to be.

5136. But do the English gunboats not come here at all?—Not that I saw; we have very often had a French gunboat here.

5137. Has there been no English gunboat?—I have seen one, but it is a bit since.

5138. Did she interfere with the French?—I never saw her interfere with any one here.

5139. Do you find that the shoal of herrings is apt to be broken if you shoot your nets before sunset?—I think they don't rise generally until about the close of the evening.

5140. Do you think it would be a good thing to have a regulation put in force that no fishermen should be allowed to shoot their nets before sunset?—The big boats would want to shoot them before sunset; they have a great length to shoot. With regard to the small boats it would not so much matter; about sunset would do for them.

5141. Then you think that the same regulation would not apply equally to large and small boats?—Not at all; large boats would have to shoot before sunset.

5142. They require longer time for shooting a greater length of nets?—Yes.

5143. But if they were to begin earlier would they not disturb the shoals, and injure the fishing in general?—No, I think not; we don't get any fish until it is nearly dark.

5144. But would not the dropping of the nets into the sea before sunset disturb the shoals?—No, I think not.

5145. Would you not think it would be an advan-

tage to you as a fisherman that there should be a regulation enforced by authority to prevent fishermen from shooting their nets until a certain hour, everybody being obliged to adhere to the regulation?—It would be better if all hands were to consent to conform to it.

5146. You think that hour should be a little before sunset, in order to enable large boats to get their nets out?—Yes.

5147. How long before sunset would you fix the hour?—An hour, or half an hour; then the sun would be down when they got their nets shot.

5148. Have you ever noticed whether Frenchmen on your coast shoot their nets on Saturday and Sunday?—Yes, they do, both on the Saturday and Sunday.

5149. Do you?—No.

5150. Then they have the advantage over you of one day's fishing in the week?—Yes, two nights' fishing.

5151. Two nights' fishing?—Yes, Saturday and Sunday nights. They are the only men who bother us.

5152. Do the Frenchmen injure you in the herring-fishing?—Yes, but the smacks do the most evil; we would not mind about the Frenchmen if the smacks were abolished.

5153. I suppose you mean that you would like to restrict them to their own ground?—No, I would abolish them altogether, and compel them to go a-fishing with the long-line, like us. Unless they are stopped they will ruin the North Sea entirely; they have done so to a great extent already. I think if they have unlimited sway, in the course of a few years the British fisheries will become extinct altogether.

5154. (*Professor Huxley.*) I understood you to say that you have about 17 or 18 large boats here?—Yes, we have 17.

5155. What is the tonnage of each of those boats?—About 60 or 70 tons.

5156. Sixty or 70 tons?—Yes, about 60 or 70 tons old measurement.

5157. What is the length of the boats generally?—About 56 feet.

5158. And the beam?—About 17 feet; from 17 to 18 feet.

5159. Are they completely decked?—Yes, they are completely decked.

5160. What is the rig; how do you rig them?—They are yawl rigged, similar to that you saw here this morning.

5161. With two masts and lugs?—Yes.

5162. How much does such a boat as that cost when completely fitted out?—It would cost about 1,100*l.* or 1,200*l.* to fit one out for the herring-fishing.

5163. Do you include nets in that?—Yes, everything necessary to make her ready for the herring-fishing.

5164. Where are they built?—Whitby and Scarborough are the principal places, I think.

5165. Are the boats generally paid for as soon as they are obtained, or do you take credit for them?—They are generally paid for directly after they are obtained, or within a trifle.

5166. Is there any considerable debt upon the boats here?—No, I don't think there is.

5167. You have a number of small boats in addition, I believe?—Yes.

5168. How many of them altogether?—It is difficult to tell. We have some large herring boats that are less than them.

5169. Are they decked or undecked?—They are undecked.

5170. What would they cost?—They would cost 50*l.* or 60*l.* to fit them out.

5171. How many of these boats have you?—Six or seven.

5172. Then you have some small cobles also?—Yes, we have a great many small cobles.

5173. How many have you?—I can't exactly say.

5174. Give a rough guess.—Well, I should say about 50.

5175. What will they cost each?—About 50*l.* or 60*l.* each altogether to fit them out.

5176–7. They are used for the line-fishing, are they not?—Yes, and for the herring-fishing as well.

5178. Have these boats all the tackle for fishing?—Yes.

5179. You spoke of inside and outside fishing; what do you mean by that—what distance from the land do you call inside fishing?—From 10 to 15 miles off.

5180. And outside fishing is beyond that?—Yes, a long way beyond that.

5181. Do you set bratt nets here?—Yes, they are set every season.

5182. Is there any very great length of bratt nets set?—No, there is not any very great quantity of these nets set; it is not carried on so much as it used to be.

5183. Do you catch many turbots with them?—Yes, but nothing to what we used to catch.

5184. Have you had to complain much of their being carried away by trawlers?—Yes.

5185. Have you lost any yourself?—I have never been in the habit of setting them, but I believe that some Staithes men have lost their nets.

5186. Is there any man here who has lost nets?—Yes, I believe there have been some lost this season; but I don't know what it was that took them away.

5187. Have you heard any complaint from Staithes fishermen of their having lost bratt nets owing to the trawlers?—There has not been much complaint about here, but I have heard a great many complaints in other places.

5188. How many nets will be required to fit out a herring boat?—Do you mean a large boat?

5189. Yes, let us take a large boat first?—A large boat will carry 120 nets.

5190. What is the length of each net?—Ten fathoms on the rope.

5191. What is the length of your snoods; do you call them snoods or head lines?—We call them nossles.

5192. They are very short commonly, are they not?—They are not above a foot long.

5193. Do you always have them about that length?—Yes.

5194. How deep will your net itself be?—About 15 score deep to our mesh.

5195. What is the size of your mesh, is it 36 to a yard?—Generally 31 to the yard. There are some 36, and there are many nets that ought to be condemned on account of the size of the mesh; they catch herrings that are not fit to be caught.

5196. What is the average size of the mesh here?—30 to 31. There will be 15 score of these meshes to the depth of the net. Most of them are 15 score, but there are some rather less.

5197. That is about five or six fathoms, is it not?—Yes.

5198. Why do you have them 31 or 32 to the yard?—Because we find that that size suits the herring-fishing.

5199. Do you know of any law upon the subject?—There used to be a law to destroy all nets that were not of the proper size.

5200. What do you think is the proper size?—There used to be a law which fixed the mesh at a proper size when a shilling would pass through it.

5201. Do you think there is any such law?—I don't know; there ought to be.

5202. You don't know that there is one now?—No. At Yarmouth they destroy millions of herrings when they are not of any use to anybody, and they are sold for manure.

5203. Is that in consequence of using too small a mesh?—No; but they take them when they are very young.

5204. Are you not aware that by the regulations now in force a herring net should be an inch from knot to knot in the mesh?—That is perhaps the old law you are alluding to.

5205. No, it is the law now in force. I will read it to you: "The meshes of all nets used for herring-"fishing shall not be less than one inch square from

STAITHES.

J. Fell.

30 Sept. 1863.

" knot to knot along the line." Did you ever hear of that?—That is the old law.

5206. Does anybody come to examine your nets?—I never saw anybody.

5207. Did you never hear of anybody coming?—No; we have none of these small nets here. It is the Scotchmen who have so great a number of them; they come to Whitby and catch herrings when they are not fit to be caught.

5208. Where do the Scotch fishermen come from?—From different parts of Scotland.

5209. The fishery officers look sharp after them in Scotland, and they won't allow them to use small meshes there.—They catch a great deal of small herring on *this* coast.

5210. I understand you to say that the French fishermen interfere with you by having heavier tackle?—Yes.

5211. Are their buoys heavier than yours?—Yes.

5212. Do your boats keep the sea?—Yes, our big boats do, but our small ones come in almost every day.

5213. Do your big boats keep the sea regularly?—Yes, they send their herrings in in the small boats.

5214. Do they keep the sea as long as the Frenchmen?—Yes.

5215. And yet you can't fish among the Frenchmen?—No, we can't. We are sure to come together. If we take a fair berth from them, we shall be alongside of them in the course of two hours, and then we have to haul in our nets.

5216. There are two regulations contained in this Act of Parliament; one is that the French fishing boats shall not come within the three-mile limit, and the other that decked boats shall always keep a certain distance from undecked boats.—We don't think so much of our own boats as of the Frenchmen. Our own boats will keep clear of us, but the Frenchmen won't haul in for us at all.

5217. What would you propose to do with the Frenchmen?—I would keep them off the coast altogether.

5218. Would you not allow the Frenchmen to come at all, or would you keep them beyond the limit?—The limit ought to be six miles instead of three.

5219. Would you be satisfied if the limit was extended to six miles, and the Frenchmen were to keep beyond that?—I would rather see them not come at all.

5220. But do not the Yarmouth boats come here?—Yes.

5221. Are their boats heavier than yours?—No, about the same size.

5222. Do they ever get foul of you?—Sometimes we are obliged to come near them, but the Frenchmen we dare not come near.

5223. Are the Yarmouth boats fitted like your own big boats?—Yes.

5224. Do your big boats ever shoot their nets among the small ones?—We all mix together sometimes.

5225. Did you ever hear that there was a law against that?—No.

5226. Did you ever hear of this,—"Whenever " decked herring boats and undecked herring boats " shall commence shooting their nets at the same time, " the undecked shall shoot their nets to the windward " of the decked boats, except they should prefer going " to leeward, to a distance of at least half a mile, to " shoot their nets." Did you ever hear of that?—I never heard that there was such a law in existence; but we generally try to shoot to the windward of them if possible.

5227. Then, there has never been anybody to meddle with your fishery, or give you any information about the law?—No; I think we must have a copy of that law at Staithes, and then we shall know about it.

5228. Do you carry any particular kind of vanes at the masthead of your herring boats?—Sometimes we have a vane on the mizen masthead.

5229. Did you ever hear of any law on that subject; did you know that you were obliged to have vanes of a certain colour?—No.

5230. Did you ever hear of this,—"For the purpose " of distinguishing by day drift-net fishing boats from " trawl-boats, both shall carry at the masthead vanes " which shall be at least eight inches in height, and " two feet in length. The colours of these vanes " shall be for British trawl-boats, red; French trawl-" boats, blue; British drift-net boats, white and " red; French drift-boats, white and blue. It is " understood that the vanes of drift-boats shall be " divided vertically into two equal parts, of which the " white shall be nearest to the mast"?—No.

5231. Do you not carry a white and red vane?—No.

5232. Then, you never heard of that either?—No.

5233. You would like the French to keep away altogether?—Yes.

5234. Do you know that there is a law about not shooting your nets till half an hour before sunset?—No.

5235. Did you ever hear of this:—"It is forbidden " to herring drift-net fishing boats to shoot their nets " earlier in the day than half an hour before sunset, " except in places where it is customary to carry on " the drift-net fishing by daylight"?—No.

5236. You see then that there is a law upon the subject?—Yes; but our big boats mostly get their nets set before sunset.

5237. How long are you in the habit of letting your bratt nets remain down in the winter?—They will shoot them one day and haul them in the next.

5238. They put them in one day and haul them in the day after?—No, the day after that.

5239. Did you ever hear that that was against the law?—No.

5240. I ask these questions not for the purpose of accusing you of breaking the law, but in order to ascertain whether you have heard of these laws. Did you ever hear of this:—"Such bratt nets, trammels, " and other set and anchored nets, shall not, except " in unavoidable cases, remain more than 24 hours in " the sea without being taken up"?—No, I never heard of that.

5241. What are what you call "farming" or "farning" boats?—The boats we leave at Staithes.

5242. Do you mean the large boats?—Yes.

5243. Why do you give them that name?—They always have called them that about Sunderland and Newcastle.

5244. Do you know the reason?—I don't know exactly. It may be because a century ago they only carried five men.

5245. They are "five-men boats"; you think that is the reason?—Yes, it's an old custom that was in use long ago.

5246. What time of the year do you consider that turbot spawn; have you ever noticed?—No, a great deal of mystery attaches to the spawning of fish in the sea.

5247. What time of the year do herring spawn?—In October or the following months.

5248. In October, November, and December?—Yes.

5249. Do you ever get herring in January or February?—No, we never fish for them then.

5250. Do you have an appearance of herring then?—I have known small herrings caught for bait at that time.

5251. But they don't come in great shoals then?—No, it is only small herrings we get then; we never fish for them then. With regard to the shoals, they are nothing so large in comparison with what they used to be.

5252. How long is it since the trawlers first came on this coast?—About 20 years since; they first came to Hull.

5253. How long has your trawl-fishing been falling off?—It has been falling off gradually ever since they came.

5254. Do you think that the trawling and the long-

STAITHES.

J. Fell.

30 Sept 1863.

line fishing can go on together?—No, I think it is impossible; they will trawl themselves out and do for us too.

5255. Do you think that any kind of regulation could be introduced so as to permit both to go on together?—No, they should never be permitted to come on this side of the Dudgeon Deeps.

5256. Where is that?—It's away south.

5257. Should they come to the Dogger Bank?—I think not.

5258. Why not?—Why, that is one of the finest breeding grounds in the North Sea; that is where they have done most damage.

5259. Do you agree with the witness who stated at a previous meeting, that he would not mind if the trawlers were kept six miles outside the Dogger Bank?—Yes, if the fishing is to go on at all they should be kept on the other side of the bank.

5260. Do you think that sufficient fish would be caught with the hook-and-line to supply the markets if there were no trawling?—Yes, the chief part of the fish got by the trawlers is not fit for human food.

5261. Why not?—It is all knocked to pieces and the gall bladders are all burst.

5262. Have you ever seen that; have you seen the fish all destroyed?—Yes, the haddocks are all knocked to pieces, and they are not fit to be offered for human food. The chief part of what they get is not fit for the market.

5263. Have you ever seen the contents of a trawl-net emptied?—No, but a trawler told me 10 years ago that it would make a man weep to see what they destroyed. I have seen fish offered for sale myself that have had the gall bladders burst.

5264. How did you know that the gall bladders had burst?—I have seen all the guts hanging out of the fish, particularly with regard to haddocks.

5265. (*Mr. Caird.*) Have you fished with the line on the Dogger Bank lately?—Nobody goes there now, they dare not go; the trawlers would take all their gear away.

5266. Then you have not fished there lately?—No.

5267. Have none of your boats fished there?—No.

5268. How long is it since they have fished there?—About 20 years, I should think.

5269. Is it 20 years since you went to the Dogger Bank?—No; it is 20 years since the smacks came there.

5270. How long is it since you were there?—About 10 years.

5271. You have not been there within five years?—No; it would, I think, be about 10.

5272. Then you can't tell, from recent experience, whether line fishing would be profitable or not on the Dogger Bank?—No; but I don't think we could catch anything there.

5273. But none of your boats have been lately there?—No; but the Scarborough and Filey men have been there frequently, and they could not get anything at all.

5274. Did they discontinue going because they could not get anything?—Certainly.

5275. Did they find that they could get more fish on their own shore?—Yes; but they can get but little anywhere in comparison with what they used to get.

The witness withdrew.

ROBERT VERRILL called and examined.

R. Verrill.

5276–7. (*Mr. Caird.*) Have you long been a fisherman here?—Yes, about 48 years.

5278. Have you practised all the kinds of fishing followed on this shore?—Yes, all but trawling.

5279. Do you agree generally with the witness you have just heard examined as to the falling off in the quantity of fish caught?—Yes.

5280. In what kinds have you noticed the falling off most?—In haddocks, cod, and ling.

5281. Have they fallen off in size as well as in quantity?—Yes.

5282. Has the cod fallen off in size?—Yes, a great deal.

5283. And the haddocks?—Haddocks have quite fallen off; there are scarcely any to catch now.

5284. What would be the weight of the cod caught in former times?—We have had them as high as 4 stone, and from that down to 1 stone.

5285. What is the weight now?—It is very rarely we get a cod of 4 stone now; they seem to be quite thin compared with what they used to be. This place of ours, about 20 years ago, was the principal fishing part we had. It used to supply all the principal places round with the best of fish, and they were reckoned the very best fish that could be caught.

5286. Are the fish now not of the same quality that they were formerly?—No, nor anything like it.

5287. The haddocks are not as good?—They are not as good, and what is more, there is none of them to catch.

5288. Do you get any turbot now?—Very few.

5289. Did you formerly get many?—Yes, a good many.

5290. What do you think is the cause of its falling off?—I think the cause is the destruction of the young. We cannot catch any large fish unless we have the young fish first to breed up into large fish. We used to catch the small fish first, and by putting the small fish on the hooks, then we caught the large ones.

5290*a*. Did you catch small fish as well as large ones on the hook?—Yes, they came to the bait.

5291. Do you think that you yourself don't destroy the fish by catching the small ones?—No, we don't destroy them as the trawlers do. The food is destroyed now before it comes to perfection. We have got haddocks at the best of perfection, and still the larger fish have swallowed them. We have got both on the same hook. Formerly we would shoot the same quantity of line we shoot now and bring as many as 5 or 6 score of cods ashore, and 15 or 20 score of haddocks. On the same lines now that we have shot for years back we can't fetch 20 haddocks ashore.

5292. Are your lines much the same that they were 20 years ago?—No, they are a great deal superior.

5293. Are they longer?—They are larger and finer and the hooks are better adapted for catching fish.

5294. Do you use the same kind of bait?—Yes, exactly. I can attribute the falling off to nothing but the small fish being destroyed before they come to perfection.

5295. What destroys the small fish?—The trawlers.

5296. Have you ever seen the nets drawn up?—Yes, and I have seen the small fish shot overboard.

5297. Have you been alongside the trawler when the nets were drawn up?—Yes, I have been alongside, but not on board.

5298. What have you seen come up in the trawl net?—I have seen large quantities of small fish, haddock, codlings, which are young cod, and such like. I have seen the trawl taken aboard on the deck, and have watched them pick the soles, and then throw all the others overboard. All that was thrown overboard was quite destroyed.

5299. Was any large proportion of the whole fishing thrown overboard in that way; suppose there were 20 basketfuls altogether, how many would be thrown overboard?—I should think 15 out of the 20 would be cast overboard.

5300. Three fourths of the whole?—Yes.

5301. Were they small fish or mangled fish?—They were all sorts, haddocks, codlings, and everything.

5302. Was it because they were small or because they were mangled that they were thrown away?—Because they were small.

STAITHES.

R. Verrill.

30 Sept. 1863.

5303. They were too small to be useful to take to market?—Yes.

5304. Did you notice whether they were injured by the trawl?—Yes, they had been lying there while they got dead. Now I have taken them off the hook alive as "wick" as they ever were. I have put them down into the water again, and I have never seen but one lie on the top of the water until it died, and birds, such as gulls, came and took it away.

5305. How often have you seen the trawl net drawn up?—Two or three times in the herring season, when we have been in the large boats.

5306. Was it always the case that three fourths of the fish were too small to be marketable?—Upon a fair calculation that is about the general thing.

5307. Have you ever seen any spawn in the nets?—I never had much practice among trawl-boats, but I have talked to the men working upon them. They told me that they have seen all kinds of spawn destroyed.

5308. When did you notice that the quantity of fish caught by your lines was beginning to diminish?—I think it has been gradually diminishing for about 20 years.

5309. Have the smacks been fishing on your shore during the whole of those 20 years?—They have been out when it is soft ground. They can't come here on our hard ground, but they have been in the North Sea, on the Dogger Bank, at Bridlington and further north; wherever they could find ground to trawl upon they were there.

5310. When did you first begin to complain of the injury done to your fishing by the trawl-boats?—We complained for a long while among ourselves; we always said they were destroying the fishing.

5311. You think the destruction has been going on gradually for the last 20 years?—Yes.

5312. Have you never a good fishing season one year, a middling one the next, and the next year a much better one?—No; we have not seen that since well into the teens of years. Our large boat at times brought large quantities of haddocks ashore which have been cured here. The boats themselves had six men each in them, and they have cured, each boat, a ton of the best salt fish. Now, for the last 15 years there has not been a single ton cured among all the boats in the fleet.

5313. For the last 15 years?—Yes, they have not cured as much within the last 15 years to the best of my recollection.

5314. Were these fish cured when the big boats were out at sea?—No, they were brought ashore on the beach and split, salted, and dried at once.

5315. On the beach?—Yes, and on the hills.

5316. Perhaps at that time there was not so good a market for your fish as there is now?—Not quite.

5317. Your fish can get quicker to the market now in consequence of railways and other conveniences?—Not so much at this place as others.

5318. Are you not nearer railways than you were before?—Yes; but not at the time I speak of. We had men with good horses who would take our fish away to Leeds and Manchester almost as quick as it goes now.

5319. Do you believe that 20 years ago you could get your fish to the market as soon as you can now?—We did not send so much away as we send now; but every fish we send away now has to go 12 miles to the nearest railway station. All has to be taken away in cart. If we had a railway down here we could send it a good deal quicker.

5320. What do you think would be the best remedy for the falling off in the long-line fishing?—I think the best remedy would be to destroy all trawl-fishing.

5321. Do you mean to stop it entirely or to limit it within bounds?—Yes, I would stop it altogether. It is good for nothing. It destroys the small fish before they come to perfection. That is one reason. Then with regard to the fish caught in the trawls, there is very little of it useful. There are just a few soles and such like that are saleable; the rest is taken and bundled overboard dead and wasted. If there were only long-line fishing all the small fish would come to perfection and make food for the large ones, and all of us would benefit in consequence.

5322. Have you noticed any falling off in the shell-fishery—crabs and lobsters?—I don't know much about that; there may have been a little falling off.

5323. Then it keeps pretty steady?—I don't know that there is any falling off there; there is a difference in the people catching them; sometimes there are a number, and there may be more catchers of crabs and lobsters in one season.

5324. Has there been any increase in the number of men employed in catching crabs and lobsters in this place during the last 20 years?—Yes.

5325. Do they catch more than they did formerly?—No, they catch no more, but they still keep catching a fair thing.

5326. There is not so great a diminution in the quantity?—No, not so much.

5327. With regard to the herring-fishing, how is it that you have a great deal more people engaged in catching herring than there were 20 years since?—Their nets are a deal finer and larger.

5328. What is the difference in the number of men employed in the herring-fishing now compared with what it was 20 years ago?—I should say that there are about twice as many employed now as there were then.

5329. When did that increase in the numbers particularly commence?—It commenced more particularly since the factories began to manufacture cotton nets; that has made more fishermen and more boats.

5330. Are nets cheaper and better now?—They are no cheaper, but quite as dear to our men; but we could catch a larger quantity of herrings with our old nets than we can now. I think the reason of that is that there are more nets, boats, and men at work catching herrings now.

5331. If nets are dearer, and they don't catch more fish, how do you account for it that the people using them should increase in number?—I make out that wherever there was an individual out of work, he got a few nets and got into a boat; they thought they would get rich, and so they got more factories to make nets for them, and that led to there being so many men engaged in the fishing as there are now.

5332. Has there been in consequence an increase in the quantity of herrings brought ashore here?—No.

5333. Do they get as many herrings as they used to do?—No.

5334. Not the whole of them put together?—No, they don't.

5335. Do you agree with the previous witness, that the shoals of herring are not as large as they used to be?—I quite agree with him; I don't think they are as large.

5336. Are you interfered with in any way by the French people in the herring-fishing?—Yes, they are very impudent men those Frenchmen; they come and take the ground from us, they are so bold. I have had my nets put overboard, and I have seen the herrings among them, and I have seen Frenchmen so impudent that they would start fishing at the end of my nets. They have shot their nets down, and I have been obliged to take mine aboard and go quietly away.

5337. Was that because their boats were stronger and better manned than yours?—Their boats are stronger, and their gear is stronger. We fly, because if we did not get away we should lose all we had.

5338. Were you fishing at that time within the three-mile limit?—Yes.

5339. Do they often come within it?—Yes, they come within a mile and a half.

5340. Do you catch the largest quantity of herring within the three-mile limit, or beyond?—Upon a fair average, I think the largest quantity of herrings is caught seven miles from land; that is as fair a calculation as I can give you.

5341. Do you think that any regulation as to the

time of shooting the nets would be of advantage to the fishermen?—No.

5342. Am I to understand that you have no desire to have any regulation enforced?—Yes.

5343. You would let every man take his own plan?—Yes.

5344. You would have no interference of any kind?—No, none at all; not in that respect.

5345. Are you in any way interfered with now?—No.

5346. Would you not desire the Frenchmen to be kept without the limits to which the Convention binds them?—Yes, I should like to see that.

5347. Then you would like that interference?—Yes, I think that would be of great advantage.

5348. But you would not have any restrictions with regard to your own fishing?—No, none at all.

5349. Would you like to have some restrictions with regard to the smacks engaged in trawling?—Yes.

5350. (*Professor Huxley.*) Have you any summer-fishing for cod?—We have tried summer-fishing, but we can't get anything, not so much as would pay us for our bait; we have not done anything in that way for many years past.

5351. How many years?—It is 15 or 16 years since we used to go cod-fishing off here in our summer boats. I have brought ashore as many as six or seven score capital cod at a time, but now, though we went for six or seven weeks we should not get six or seven score. In point of fact it would not pay us for our bait and gear.

5352. How long did your summer season last?—For cod-fishing we began in the fore part of July, and continued until September. That was for the cod-fishing time.

5353. Do you not carry on this cod-fishing now in the summer time?—No, we go to the herring-fishing.

5354. There was a great quantity of cod brought ashore this morning?—There is no account to be taken of them.

5355. Why not?—Because like swallows they fly about after the herring. They are here to-night and there the next. One day they are off Scarborough, and the next nobody knows where to find them.

5356. Then during the summer you have no fishing for cod unless the herring are there?—When the herring are there in general there will be a few cod swaddling among the nets in deep water.

5357. The cod we saw to-day had been caught with the hook?—Yes, but not such hooks as we have been speaking of. They are a different hook, and we have a few lines for them when they are swaddling about the water.

5358. Were these caught with the hand-line?—Yes, with a few hooks.

5359. Then you don't set your long-lines now?—No.

5360. How long is it since you set your long-lines?—Two or three months.

5361. When will you begin to set them again?—We are going to set them now. They had them shot the other day, but they neither got cod nor haddock. They have six lines with 400 hooks on each line, and when they hauled them in they did not get a haddock, unless it might be three or four little things. That was all they got on six lines with 18 or 20 scores of hooks on each line.

5362. Twenty years ago were you accustomed to set your long-lines during the summer, in July, August, and September?—Yes.

5363. Did you catch plenty of fish?—Yes.

5364. But for years past you have left off doing that?—Yes, we can't catch haddocks now.

5365. You say it is 15 or 20 years since you were able to do anything with the long-line summer fishing?—Yes, it is all that.

5366. To what do you ascribe it?—I can think of nothing unless it be the trawling.

5467. You have had a good winter-fishing all this time?—No, we have had a very poor one; 40 cobles go regularly in the winter time, but it is very rarely we get a cod ashore.

5368. Do they go from October until March?—No, they go from the fore part of November till March. I have seen plenty of cod and haddock got all winter. It is now rare to see 20 good haddocks and half a dozen cod in one coble.

5369. Where do you shoot your long-lines during these months?—We shoot them about six miles off, from that to ten; then we change the ground. There is hard rocky ground for seven, eight, or ten miles, and then we come into soft ground again. That is the place that they can trawl over with their smacks.

5370. Do you prefer setting your lines on the hard or soft ground—which yields you most fish?—The hard ground; the bait will lie longer there.

5371. The smacks cannot come there, can they?—No.

5372. They never trawl over your lines there?—No, they are fast enough for that.

5373. Do they go over the soft ground?—Yes; it is there where the damage is done.

5374. Have they ever carried away your lines?—No.

5375. Are there in a season's fishing many complaints of lines having been carried away by trawlers?—There is a soft ground here that runs about a quarter of a mile in breadth to four miles in length, and they can put their trawls in that and drag them along; if we have our lines there they take them away altogether. In point of fact we dare not put them down there now owing to the trawling.

5376. Nobody puts them down there now?—No, that is the place where we often had to shoot in the summer time. Now if the trawlers come we have to take our lines up, if they happen to be there. They take the ground from us altogether, and we are compelled to get out of the way.

5377. Then you set most of your lines on the other ground?—Yes, and we bait the lines longer there. We bait them with small fish and catch large ones. They will lie longer on the clean ground, and fetch more turbot, ling, and cod.

5378. Do you go out with your long-lines as far as the Dogger Bank?—No, but the large boats have been many a time off the Dogger Bank, by the Dogger side.

5379. Do you fish with long-lines or hand-lines?—Long-lines.

5380 Is that on the hard or soft ground?—The soft ground.

5381. But these trawlers can trawl over there?—Yes.

5382. Have you lost any lines there?—When we went there there were no trawlers.

5383. Did you ever hear of any Staithes fishermen losing lines there?—They never were there.

5384. Don't they go in the winter to the Dogger?—No, their boats lie up in November. Then we have 40 cobles or small boats with three men in each boat.

5385. Did you hear of the small boats losing their lines last winter?—No, not by the trawlers.

5386. Then your idea of the injury done by the trawlers is not in carrying away your lines so much as in destroying the spawn and small fish?—Yes, they have done great injury among our nets.

5387. Do you mean bratt nets?—Yes. I have bratt nets.

5388. Have you ever had any bratt nets carried away by the trawlers?—No.

5389. Do you know anybody who has?—They could not trawl on the ground where we set our bratt nets.

5390. You don't set them on the soft ground?—No, on the hard ground.

5391. Is that always the case?—Yes.

5392. Why don't you set them on the soft ground?—It is too far from the land.

5393. The fish are commonly among the herrings?—I have had them set on the soft ground about 15 miles from this place, but the fish were not good.

5394. You said the trawlers had carried away your nets, what nets were they?—Our herring nets.

STAITHES.

R. Verrill.

30 Sept. 1863.

5395. Did they come among your herring nets?—When our nets were out, if the night was coarse our nets would be ahead of the vessel and then half a dozen trawlers would come right over them. Our boat having to drift with the wind and tide they would come right athwart the trawl ropes, and rather than that the trawl ropes should receive any damage they had a large thing like a knife which they put down under the water and it would cut our nets and warp, and let all go adrift.

5396. Could you never find out who did that?—No.

5397. Your boats were made fast to your nets?—Yes.

5398. Could you not see who did it?—Not in a dark night. Before we got our vessel under weigh the trawler would be gone.

5399. But you know that the trawler can be punished for that, that it is against the law?—Oh yes; they have had some serious expense to make up occasionally. Some of them have been found out by the Scarborough fishermen.

5400. Are you acquainted with this article of the convention: "Trawl-fishing is forbidden in all places where there are boats engaged in herring or mackerel drift-net fishing." Did you know that that was the law?—Yes.

5401. Do you know that this also is the law: "Trawl-boats shall always keep at a distance of at "least three miles from all boats fishing for herring "or mackerel with drift-nets." Did you know that?—Yes.

5402. Do you think it is possible to enforce that law, or do you think the difficulty of seeing the trawlers at night is so great that it would be impossible to enforce it?—I don't side with that regulation at all. It would just give them the same privilege that they have now; my opinion is that they should be done away with altogether.

5403. Supposing this law were enforced, you don't think it would afford sufficient protection?—No.

5404. Not even for the herring-fishing?—It would be a protection for keeping them off, but still it would give them a license to come to the ground, and would be no advantage to us fishermen.

5405. Although it would protect your drift-nets, you think the trawlers would be a great means of mischief by the mere fact of their trawling?—Yes, but it will not protect our nets at all, not if they were seven miles off. I have seen when they have had their trawls off us that before the flood or ebb, or whatever tide we had driving us, was spent, they would be alongside of us.

5406. But the law says they must keep three miles off always?—That is impossible; they could not do that.

5407. Do you drive on them, or do they drive on you?—We drive on them.

5408. The law says more than that: "Whenever "herring or mackerel boats shall commence drift-"net fishing in any place whatever, the trawl-boats "which may be already fishing in such place shall "depart therefrom and shall keep at a distance of "at least three miles from the said drift-nets, herring, "or mackerel boats." You see that they must get out of your way?—Yes, but they must have the trawl on board to do that. If they take the trawl on board they can come as near as they like.

5409. Whether they have it on board or not they must always keep at least three miles away from you according to the law?—There may be one boat fishing here with drift-nets, and as far as the eye can reach all round you will see a hundred sail of all sorts of fishing craft going with the tide; so that if your boat is three miles from one of them, I will be bound to say that soon another will be nearly on the top of you.

5410. But supposing the law could be enforced, do you think it would afford sufficient protection?—No, I don't think it would be any protection at all.

5411. Do you mean that it could not be carried out?—They could not keep clear of the fleet of herring boats if they had their trawls down.

5412. But they are bound to get their trawls up and go off?—If they did that it would do.

5413. You think that would be a protection?—Yes, but there may be a part of the night when my nets are overboard, and when I look at them I find there is no fish. Then I get the nets aboard as fast as possible, and go eight or ten miles from that place. I heave them over again. I can see the herrings running in the water, and therefore I put the nets overboard. Now that may be the very place where the smacks are trawling.

5414. But they are bound to get away from you according to the law?—But they may not see us on a dark stormy night.

5415. Have you no lights?—Yes.

5416. What sort of lights?—A white light, a candle.

5416*a*. Have you two lights on your masthead, one above the other?—No.

5417. Did you ever hear of any law requiring that you should have two lights on your masthead?—Yes, I believe there is a law to that effect.

5418. You don't obey it?—Yes, they do; they put one light above the other at Scarborough and other places.

5419. I understood you to say that there is nobody here to see whether you obey the law or not?—No.

5420. So you just do as you like?—Yes, but I know that the law is that we should have two lights, one above the other.

5421. But still you don't obey the law, and there is nobody to ask you any question?—No.

5422. (*Mr. Caird.*) You said there were no trawlers off the Dogger Bank when you used to fish there?——Yes, when we used to go with our large boats formerly.

5423. At that time there were no trawlers off the Dogger Bank?—No.

5424. How long is that ago?—It will be 20 or 30 years since.

5425. Why did you discontinue going there?—I gave up going in the large boats and went in the small ones, and then two or three years back I went with the large ones again.

5426. It was not from want of plenty of fish that you discontinued going to the Dogger?—There is nothing worth while going for now.

5427. You say you gave it up some years ago, at which time there were no trawl boats on the Dogger?—I gave it up because I thought I would rather be in another boat. When we give a large boat up, we generally start with a small one.

5428. Do you get any mackerel on this coast?—Very few.

5429. Do they not come here?—There has been a few, but we have never had a mackerel season here.

5430. Do you never try to catch them?—We have been to catch them at the proper time, but there is never any quantity to catch.

5431. Have you a proper kind of net to catch them with?—I believe there are a few.

5432. Has it not been worth following?—I suppose with our nets now we will catch mackerel as well as the mackerel nets used to do.

5433. Do you mean your herring nets?—Yes.

5434. With your herring nets you think you can catch all the mackerel that come on this shore?—No.

5434*a*. Do the mackerel sometimes come here when the herring are not here?—Sometimes they do.

5435. Do you try to catch them when the herrings are not here?—No.

5436. Why is that?—We try to catch herrings; we never go with the intent to catch mackerel and nothing besides; but very often we have been trying to catch herrings, and instead of getting herrings we have got a quantity of mackerel.

5437. Hitherto, you have never thought it worth your while to follow the mackerel fishing?—No.

The witness withdrew.

STAITHES.

John Webster called and examined.

J. Webster.

30 Sept. 1863.

5438–9. (*Mr. Caird.*) Have you long been a fisherman here?—Yes, I have been a fisherman for 30 years.

5440. Do you agree with the previous witnesses that the quantity of all kinds of fish caught on this shore has fallen off?—Yes, I quite agree with them in what they have stated.

5441. Do you agree with them that the cause of the line-fishing being now so unproductive is the operation of the trawlers?—Yes.

5442. Have you ever seen a trawl net drawn to the surface?—No, never.

5443. Then you cannot speak with regard to what there is in the trawl net of your own knowledge?—No.

5444. Where particularly have you noticed that the fishing has become defective?—Upon our own ground.

5445. Have you been in the habit of fishing on the Dogger Bank?—I have been there, but it is a good many years since.

5446. How long is it?—23 or 24 years since.

5447. Were there any trawl-boats there then?—Not that I saw.

5448. Why did you give up fishing on the Dogger?—I went with a big boat, and I left it to go with a small one.

5449. Did the big boats continue to fish on the Dogger?—Yes, for a good many years after that.

5450. But you yourself never went back?—I continued with the small cobles.

5451. With regard to the herring-fishing, has there been in your experience a decline in the size of the shoals that come on your shore?—There has been a decline. We used to have three or four lasts caught in a night, but now there are not so many thousand caught.

5452. How many are there in a last?—10,000.

5453. You say that you have seen one boat bring ashore three or four lasts in a night?—Yes, and sometimes with a good catch I have seen seven, eight, or nine last brought ashore.

5454. What, 90,000 fish in a boat?—Yes.

5455. What is the largest fishing you may have seen within the last 10 years?—20,000—two lasts of herrings.

5456. What do you think is the cause of that falling off?—I think it is all owing to the smacks.

5457. Do the smacks disturb the herring-fishing as well as the line-fishing?—Yes.

5458. In what way do they disturb it?—The herrings in general come upon the soft ground and spawn. The smacks are trawling over that ground, and they drag among them and break up the spawn, and the fish flits. In that way they destroy all before them.

5459. Have you noticed that since the smacks came upon the ground the herrings have become fewer in number?—Yes.

5460. How long is it since you began to observe this?—I can't recollect.

5461. Have you not sometimes a season in which there is a great quantity of herrings caught?—That is not often the case now; the catches are all very moderate now.

5462. Have you not had a good herring season during the last 10 years?—No, only just a canny one; but the herrings have sold much better than they used to do, or else the men could not have made a living out of it.

5463. Are you disturbed at all in your fishing by the French fishermen?—They come drifting upon us with the wind, and we are obliged to haul in from the place they are fishing.

5464. Would you desire to see any regulations established as to the time of shooting your nets?—No, I would not, I would allow every man to shoot when he liked.

5465. Do you find that the French fishermen come within the three-mile limit?—Yes.

5466. Then they pay no observance to that?—No, they come within a mile sometimes.

5467. In your mode of fishing, do you destroy any young fish?—No, we don't destroy any, we catch them all with the hook.

5468. Do you destroy any spawn?—No, I never saw such a thing.

5469. Do you trawl for soles?—No, I never saw a trawl shot in my life, nor hauled up either. I have seen them dragging them, and I have seen herrings among the trawls, and they have flown away like birds to get clear of them. I have seen that when the Hartlepool trawlers were at work.

5470. You have seen the herring among them?—Yes.

5471. In what way did that arise?—The trawlers were dragging among them spoiling the spawn.

5472. The herring spawn?—Yes.

5473. I thought you said the herrings themselves?—The herrings were there too at the bottom; at the night time they rise to the top. When they are lying on the ground they go with the tide up and down, and when they are floating the trawlers come among them and move them.

5474. (*Professor Huxley.*) What time of the year was that you saw the trawlers destroy the herrings?—In June or July.

5475. You were taking herring at that time?—Yes, we were fishing for them.

5476. What condition were they in, were they full fish?—They were full fast fish; they were ready to spawn. The herring spawn is quite hard before they spawn, but just before they begin to spawn it turns quite soft, and then they go to the bottom to spawn.

5477. You saw that these herrings were quite ready to spawn?—Yes.

The witness withdrew.

Burton Verrill called and examined.

B. Verrill.

5478. (*Mr. Caird.*) Are you a fisherman here?—I have been a fisherman here for 30 years.

5479. Do you agree with the previous witnesses in the statements they have made?—Yes.

5480. Is there anything that you desire to add?—Yes, I should like to say a little if you will ask me the questions.

5481. Have you ever been on board a trawl-vessel?—I have frequently been alongside a trawler.

5482. Have you seen a trawl brought up?—Yes.

5483. Have you done that more than once?—No, only once. It was in the month of July last, I believe. Only this year.

5484. This year?—Yes.

5485. Are you able to tell me what was in the trawl?—There was an abundance of small fish. I was not on board the vessel the time the trawl was drawn up, but they heaved two basketsful into our boat. They were all small fish—gurnets, dabs, plaice, and all sorts of small things. They then set sail and went away. The trawl net was full of the small fish. A great deal was thrown overboard. There was as much in the net as seven men could take on board.

5486. Then your two basketsful was only a small proportion of the catch?—Yes, a very small proportion.

5487. Would you like to have any Government regulations or restrictions in regard to the herring fishery, as to the time of shooting your nets and so on?—I don't know much about the herring-fishing. I go sometimes by chance, but I think the regulations we make among ourselves are quite good enough. I would let any man have his own freedom to shoot his nets when he pleased.

5488. You think that would be better than imposing any regulation?—Yes, I think it would soon cause war on the fishing ground if it was not so.

5489. Have you the same complaint to make as the

STAITHES

B. Verrill.

30 Sept. 1863.

other witnesses, with regard to the French fishing boats?—Yes.

5490. Would you like to see your own fishermen protected by the French boats being kept without the three-mile limit?—Yes.

5491. Do you think it would be better for your fishing if that were so?—Yes.

5492. Are your principal takes within the limit, or beyond it?—Perhaps a little beyond it.

5493. That would not protect your fishermen against the French boats then?—No, but I should like to see the gunboats sent at them. I should like to see them made away with altogether. I don't like to see the French fishing boats on the ground at all.

5494. (*Professor Huxley.*) Do you set any bratt nets?—No.

5495. Are you principally a long-line fisherman?—Yes.

5496. Did you ever have any of your long-lines taken away by the trawlers?—No, I once had one turned end over end, but I got it again. It was a great chance, however, whether I did so or not.

5497. Still you never have lost one?—No.

5498. You heard me read some of those regulations? Yes.

5499. Did you ever hear of any of them before?—I never heard of any except the regulation with regard to the light.

5500. Did you ever hear of any regulations about bratt nets?—No, I did not trouble my mind about them.

5501. Do you think that anything short of putting down the trawlers would be of any advantage to you?—I would abolish them altogether if I was in the Government.

5502. Would you not allow them to come on the coast at all?—No, they are entirely dragging the ground up; they are making it all good for nothing.

5503. Were many of the fish you saw brought up in the trawl net dead or alive?—There were some of them alive when they came out of the water, but when they were knocked down altogether in a heap they would soon be dead.

5504. Did they smell bad?—I was not on board, and could not, therefore, say.

5505. Did those they gave you smell very bad?—No, they were not bad. I took them for bait.

5506. Have you ever occasionally eaten trawled fish?—Yes, I think I have eaten trawled plaice sometimes.

5507. Were you ever ill in consequence of eating it?—I never was ill in my life.

The witness withdrew.

W. Thompson.

WILLIAM THOMPSON called and examined.

5508. (*Mr. Caird.*) You are a buyer of fish here?—Yes.

5509. Have you been long engaged in that business here?—Yes, for the last 33 years.

5510. Do you buy a large proportion of the fish that comes ashore here?—I used to do so; there is no large quantity got here at all now.

5511. Do you buy a large proportion of what is got?—I keep on buying it the same as other people.

5512. Then you can tell us whether the quantity has increased or diminished?—There is not one quarter, not one sixth part of what there used to be.

5513. Not one quarter altogether in a season's fishing?—No; in the whole season's fishing from the 1st of January to the 1st of January again there is not one quarter of what there used to be formerly.

5514. Is there any difference in the size of the fish caught?—The codlings are about the same, but in the haddocks there has been a diminution.

5515. Do you agree with one of the previous witnesses about cods in former times having been as much as 4 stones?—That has only been the case in an odd one or so. Sometimes we get an odd one of that weight now.

5516. Then you think it was a mistake to say they were of that weight?—Yes, speaking generally.

5517. You mean to say that you occasionally catch as large fish as you did formerly?—Yes, we do get an odd one by chance.

5518. Then I understand you to say that occasionally very large fish of that kind used to be caught formerly, and that occasionally there is one caught now?—Yes, but with regard to haddocks they are not generally as big as they used to be.

5519. There has been a falling off in the size of the haddock?—Yes, there is not one twentieth part of them caught now. I have got more out of one boat in one day's fishing 25 years ago than I can get out of 20 boats now.

5520. Can you tell us the quantity of fish that would be caught in a season, a week, or a month?—No, but I can give you some idea of what used to be cured.

5521. What quantity of fish used formerly to be cured here?—I should say that as much as 200 tons used to be cured here.

5522. How long ago is that?—That would be 20 years since, from that up to 30 years ago. I believe you will be able to get statistics of the whole fish cured from the Fishery Board at Edinburgh.

5523. Do they get a return of the fish cured here?—Yes, they have got it within the last 10 years to my knowledge.

5524. What quantity is cured here?—About 4 tons for every 50 or 60 that used to be cured.

5525. Has that not arisen from the fact that you can send your fish to the market fresh now?—It may partly have arisen from that, but that would not affect it to any great extent. The great reason is that we can't get fish to cure now. When we have fish in the warm weather it must be cured.

5526. In the warm weather you cannot keep fish?—No.

5527. Have you no ice to keep it in?—No, it would not pay the railway carriage here. We should have to pay 3*s.* a cart for ice, and we have too much land carriage to pay for the fish to render it profitable to keep ice. Then, again, the cods would not be in season at that time.

5528. Take 20 years ago, what quantity of fish came in on a fair day's fishing in the morning?—Do you mean from the Dogger Bank?

5529. I mean your fishing altogether.—There have been boats going to the Dogger Bank every year, and they have been five or six times on the Dogger Bank this year.

5530. How have they done there?—They have got next to nothing. I bought enormous quantities one day some years ago on the Northumberland coast. I have been at Newcastle with immense quantities of fish caught in a day or two. I have bought as many as 1,800 large fish 15 or 16 years ago.

5531. Is there anybody present who has been on the Dogger Bank this year?—No, they are all at sea now in the big luggers. There is not a boat that has got 80 stones of halibut this year. When I was young we have caught 12 score of halibut in two days.

5532. This year you say you have caught none?—The highest catch has not reached 80 stones, and where one would get 40 stones other boats would not get 10.

5533. That is the catch of halibut of which you are speaking?—Yes.

5534. How has it been with regard to the other fish?—They used to get 700 or 800 head for converting into salt fish; 500 or 600 score in two or three days. They were constantly bringing that quantity ashore for curing. Now they can only get 60, 70, or 80, and it is only a very chance boat that gets 5 score. The consequence is that they very seldom go a long way out now.

5535. Then you say from your knowledge of the

fish brought in by the boats from the Dogger Bank that the takes have greatly fallen off?—They have almost entirely fallen off, and it was the best fishing ground they had formerly.

5536. What kind of fish do you particularly refer to?—The cod and ling.

5537. Has the cod fallen off in size?—It was the best fish we had, but it is not there at all now; they don't catch any.

5538. With regard to the herring-fishing, have you noticed any considerable decline in that; has the quantity caught here fallen off?—The catch of herring by each boat has fallen off, but there are ten craft to catch them now, for one that there used to be.

5539. Are there in the whole as many caught as there used to be?—I should say there are a great deal more caught altogether; but, as I have just told you, there are ten craft now for one that was formerly.

5540. Then the total quantity brought ashore has not decreased, but each boat gets less?—Yes.

5541. Do you, as a fish buyer, find that you can get as much fish as you used to do?—No, all the strange boats run to Whitby; sometimes there are 700 or 800 sail.

5542. Do you think there is as much fish caught off this shore as formerly?—Yes, I should say there are more herrings caught from the 1st of June to the 1st of October than used to be caught formerly.

5543. To what markets do you send your different kinds of fish?—To Manchester, Liverpool, Birmingham, London, Nottingham, and all round the country.

5544. Which is your principal market?—Our principal market is London.

5545. Do you send all your best fish to London?—Yes, generally.

5546. Do you get the best price there?—No, it is lower there sometimes.

5547. Where do you get the best price?—At little places where there are only 50 or 60 people, but they cannot take a large quantity, so the greater part of the fish necessarily goes to Manchester, London, and the great markets.

5548. Small places have not a regular market and you cannot depend upon them, is that it?—Yes.

5549. In the course of your experience as a buyer of fish, have you extended the number of places to which you send your fish now as compared with the number you sent it to 20 years ago?—We always sent to London.

5550. Do you send to many places of 60,000 or 70,000 people?—The fish goes to Leeds; it used to go to Bradford, Huddersfield, and all round that neighbourhood.

5551. Do you find that you have a greater number of markets open to you than you used to have?—Yes, we can get the fish in quicker.

5552. To a greater number of markets?—Yes.

5553. Is that of advantage to you?—Yes, a little.

5554. Has the price of fish increased during the last 20 years?—Not much.

5555. What was it before?—It was worth more money when we had to cart it than it is now.

5556. Was a stone of good fish worth more money then than now?—Yes, they bring their fish from long distances now, even from Scotland. If there had been no railways fish would not have been got under 6*s.* or 7*s.* or 8*s.* a stone. If there had been trawling then they would not have got their fish to the market.

5557. Has trawling done anything to decrease the price of fish?—They send all their rubbish into the market.

5558. Why do you call it rubbish?—Why it is injured and knocked about in consequence of the trawl dragging upon the bottom; a great portion of it is not fit for use. It is only that portion on the top of the trawl that is good for anything.

5559. Have you ever bought any trawled fish?—No, I dare not send it to the market. I have seen plenty of it, however. Only the week before last at Scarborough I saw plenty of it.

5560. (*Professor Huxley.*) Do I understand you to say that the cod and the haddock are smaller than they used to be?—Yes, the haddock especially, and the cod a good deal; they have both fallen off. It used to take 20 or 23 score to the hundredweight, but now it takes from 30 to 33.

5561. Is there any difference in the size of the herring?—The size of the nets is larger, and bigger fish are caught than there used to be.

5562. Do you have to pay more to the fishermen than you used to have for the fish?—Yes, I give more for the fish now.

5563. I am speaking of the price per stone?—Yes, we pay more now.

5564. But yet you don't get as much as you used to do?—No.

5565. Then in that case it must have been a dead loss to you dealers?—Yes, and a loss to the catcher.

5566. But how can that be if the fishermen get more money?—They get more money, but they have not as much fish to sell.

5567. I understand you to say that as compared with 20 years ago, fishermen get more money for their fish and the public have it rather cheaper, and that between the two the dealer gets less profit. Is that what you mean?—Yes; they get them a little cheaper in the country. I mean trawled fish. Good line-fish is becoming dearer inasmuch as it is scarcer, and we are obliged to give more for it on the beach than we did formerly.

5568. You give more for it now?—Yes; I did not give as much for it when the carts were going. We used to supply Yorkshire, Leeds, Manchester, Halifax, Bradford and many other places, but they can come quicker to many of these places from Scotland now.

5569. What is the difference in price per stone you get for cod now compared with 20 years ago?—One day it may be 1*s.* and another 2*s.* 6*d.* It was the same then. It used to get up sometimes from 2*s.* 6*d.* to 7*s.*

5570. Then do you get per stone for cod the same or about the same as you used to get?—Yes, unless there happens to be a trawl near.

5571. But I mean taking one day with another?—I can get as much now as I did then.

5572. Do you not get as much in the market as you used to get for your fish taking one day with another?—Sometimes but not regularly. It is carried to market for one third less than it used to be when it was carted. It was obliged to be sold then for more money.

5573. Is the average price you get for your fish less than it was 20 years ago?—I think it must be less when all the expenses are reckoned up.

5574. But I want the price apart from the expenses?—It does not fetch so much money as it did, but it costs three times as much getting it to the market.

5575. If you paid 1*s.* for a certain weight of cod fish 20 years ago, do you mean that you will not get 1*s.* for it now?—No; on the whole the money the dealer gets per pound or per stone is less than it was 20 years ago.

5576. On the other hand you have to pay more to the fishermen?—Yes, because it is got for less money to the market.

5577. As matter of fact you have to pay more money to the fishermen?—Yes.

5578. You can afford to pay more because you don't have so much carriage to pay?—Yes. I know that it is 3*s.* a hundredweight for carriage all over. I know what it will cost so that then we have only to get it to the railway. If I buy a ton of fish I know what it will cost precisely to bring it to the market. Many a time I pay more money for the fish than I know I shall be able to get for it.

5579. (*Mr. Caird.*) Then the advantage derived from the reduced cost of sending fish to the market chiefly goes into the pockets of the fishermen?—Yes, and into the pockets of the railway companies; they get plenty of it.

5580. But it costs less to carry it now than it did formerly?—Yes.

STAITHES.

W. Thompson.

30 Sept. 1863.

5581. But you get less for it in the market?—Yes.

5582. And yet you are able to pay the fishermen more?—Yes.

5583. Then the difference is given to the fishermen?—Yes.

5584. What do you think is the cause of fish becoming cheaper now with a much larger consumption?—Formerly none of the Northumberland fish could come to the market; it never could get further than Newcastle; but as it comes now there is a larger supply in the market than there used to be.

5585. Do you believe there is a larger supply than there used to be?—Yes, it comes now to the market from so many places—from Penzance and Scotland.

5586. Take the Manchester market, does a larger supply go to Manchester than did 20 years ago?—Yes, three times as much from the fisheries all round the island.

5587. Is the supply increasing?—Yes of trawled fish, but not of fish caught by the lines.

5588. Is it owing to the trawlers that the supply is increasing, not diminishing?—It is increasing in the meantime, but 20 years hence we will have no fish at all, because they will have killed all the fish round.

The witness withdrew.

G. Webster.

GEORGE WEBSTER called and examined.

5589. (*Mr. Caird.*) Have you long been a buyer of fish here?—Yes, for 30 years.

5590. Have you found that the quantity of fish brought ashore here for sale by the fishermen has increased or diminished?—It has diminished vastly. It has greatly diminished.

5591. Have you noticed if there has been any falling off in the size of the fish as well as in the quantity?—The fish are far less in size now, and a deal less in quantity.

5592. In which fish have you particularly observed any diminution in the size?—In the haddocks and codfish.

5593. Has there been much diminution in the size of codfish?—They don't keep up to the point they did.

5594. Were you formerly in the habit of getting any turbot here?—Yes.

5595. Do you get any now?—A little sometimes.

5596. Do you get any skate?—Yes.

5597. Any soles?—Very few are found here, this is not a place where they can practise trawling at all.

5598. There is no trawling for soles here?—No.

5599. Have you got as many herrings lately as you used to get?—I don't think the trawl-fishing affects the herring-fishing so much as it does the line-fishing.

5600. Do you think there is as much herring caught here as there was formerly?—Yes, we have as good a supply of herrings as we ever had; the takes on the average are quite as large.

5601. Do you agree with the previous witnesses as to the price of fish; is the price of fish in this place less than it was 20 years ago?—I can't say that it has fluctuated very much, but then we got four times the quantity of fish we get now; at the same time the markets are more steady and regular now than they were then; we don't find fault with the market at all, we realize a good price, but we can't get a sufficient quantity of fish to send to market.

5602. Ten years ago was the price paid for fish in Manchester the same as it is now?—It was much about the same.

5603. The price has been pretty steady?—It has not much increased or diminished. We had good markets and bad ones then, and we have good markets and bad ones now. It is just according to the quantity of fish sent into the market.

5604. Then, on the whole, you say that there has not been any great or gradual increase in the price?—I can't say that there has. Sometimes when I buy fish on a good day I expect a good market for it, but when it arrives in Manchester, there are such quantities of the rubbish caught by the trawlers in the market that there is hardly any market for our fish at all. In such cases we are obliged to sacrifice a good deal of money.

5605. Have you ever bought any trawled fish?—Never; but I have seen it sold at low prices in the market, and I have seen great quantities of it carted away that could not be sold at all.

5606. Where was that?—At Leeds, Manchester, and other places.

5607. How did you know it was trawled fish?—The fish was much knocked about, and some of it was in a state of decomposition. It had evidently been kept on board until it became bad.

5608. But that is not fish that can be sold with advantage in any market?—If it had been caught with a line it could have been sold to advantage.

5609. But you could not expect fish in such a state of decay to sell in the market?—It will sell when there is nothing else.

5610. Would fish beginning to rot sell anywhere?—Yes, for manure.

5611. Is it sold for manure in Manchester?—I have seen 100 baskets sold together and taken away for manure.

5612. (*Professor Huxley.*) I understand you to say that sometimes you could not get a good price for your fish on account of trawled fish coming in and supplying the market?—Sometimes it injures us very much.

5613. You are speaking now of your fish being in perfectly good condition when it is sent to market?—It generally is in very good condition. If we saved the train to-day, all the fish you saw on the beach this morning will be in the market to-morrow morning.

5614. If this trawled fish is bruised and bad, how is it that people will buy it?—Because they can afford to sell it so much cheaper.

5615. But would not people like to have sound fish rather than broken and damaged fish?—There are all sorts of people in the world; some persons like a great lot of stuff for very little money.

5616. But surely they would rather purchase your good fish than damaged and broken trawled fish?—But if they had not that damaged trawled fish to get people would be obliged to buy good fish.

5617. If your fish is driven out of the market by trawled fish, surely it could not be so bad, or it would not drive your fish out of the market?—It always does affect the market. We always realize a less price for our fish when the trawlers' fish comes in, and the more that comes in the lower the price is.

5618. But you don't find in the agricultural market that when a man sends bad wheat into the market it drives out the good wheat. Then how does the trawled fish drive good fish out of the market?—I don't know how it is, but it is the case. I think a large quantity of bad wheat coming into the market would affect the price of good wheat; it would bring it down in price, although it might not drive it out of the market altogether. For 17 seasons I have had fish at 1*s.* per stone, but I now pay 1*s.* 9*d.* I have had 100 stone from 16 boats in the course of a week, but last week I had only 50 stones for a whole week's fishing, and it was just cod and ling that was caught where the trawlers could not come.

5619. Do you think the price you pay to the fishermen has increased of late years; I mean the price per stone?—Yes, the price I give for fish here has increased a good deal, because the railways have opened up fresh markets. I can get the fish away for less money than I did formerly.

5620. You are able to pay more to the fisherman because you pay less for the carriage of the fish to the markets?—Yes.

The witness withdrew.

STAITHES.

G. Westgarth.

30 Sept. 1863.

GEORGE WESTGARTH called and examined.

5621. (*Mr. Caird.*) You are acquainted with the fishing on this coast?—Yes, I am. I am not much acquainted with the fishing myself; I never have been. I am an alum manufacturer and live about a mile from here, but I am constantly about the place and know a good deal about the fishing. I have known Staithes for the last 60 years. In the early part of that time we sent our alum away from this place in small vessels to London, Hull, and so on. 40 or 50 years ago we hardly had a ship that went either to Hull or London in the season, but took some fish with it, and further back, when I was a boy and a young man, the fishermen caught a great deal more fish in comparison with what they catch now. They caught a great deal more in the winter time. At that time it was split and salted, and I remember the immense quantities of fish that were caught day by day. As soon as the fish came in-shore every day it was split, washed, and converted into salt fish. We have taken in our vessels 43, 50, and 60 barrels of fish, and at one time we took as much as 200 barrels.

5622. All of salted fish?—Yes, pickled fish. We took it to Hull, where it was sent into the interior of the country.

5623. Was that in the summer time?—No, in the depth of winter, but in the summer time they salted also.

5624. But don't the facilities for getting fish to the market now in the winter time, when there is no risk, explain the fact that fish are sent to the market fresh and are not salted at all?—Yes, to a certain extent. I have seen large quantities split up here and salted. I frequently send down in the winter time for fish now, and find it very difficult to get one at all. The fishermen said they had not got more than was sufficient for baiting purposes. The quantity of fish caught has fallen off enormously. There are three kinds of fishing—the small cobles, the large cobles that go in the herring season, and the large boats. The large boats have already been described to you. They used to go from March, about Lent, till the beginning of the herring-fishing. Then all the rest of the winter the men who go in the herring boats take to the small cobles, because they cannot land the large vessels here. In the winter time there are about 50 cobles going to sea with three men in each, but they get little; they get very little fish now. What is the cause of that I can't tell, but they attribute it to the trawling. In the summer time we have not only the large boats going—from 10 to 15 or 16 of them—but a certain number of the cobles are engaged in fishing as well. In former times I have frequently known that they have been obliged to throw fish overboard, they have been so loaded. There is no such thing now. At that time the cod-fish they caught was principally converted into salt fish. The quantity of dried fish that we took away in our small alum boats at that time was enormous. True, there have been railways since, but the quantity taken away altogether is very small compared with what it was then. We have had 8, 10, 20, and 30 tons of dried fish on board for London at one time. I remember that at one time a brig came and was loaded with dried fish for the Mediterranean. When I recollect all these circumstances I have no doubt in my own mind that the fishing has greatly fallen off, except with regard to the herrings. In the herring-fishing there has been an enormous increase in the number of vessels. 43 years ago there was no real herring-fishing here at all, they merely caught a few for bait. The coast is now covered with herring vessels, so that there is as many herrings caught as ever there were.

5625. Is there any record kept here of the quantity of fish brought ashore?—No, I think not.

5626. Then you have no means of comparing it accurately with what it had been in former years?—The only way I have of comparing it is by calling to mind the fact that I frequently send for fish now, and am not able to get any. That never occurred in former years.

5627. But that may be accounted for by the fact that by sending it to market they get a better price for it?—No, they cannot get fish, that is the reason. One of the witnesses examined here, Mr. Fell, has told me that he has come ashore with 50,000 haddocks, and now he will not get five or ten. I have known our workmen buy a score of haddocks at 9*d.*, 8*d.*, 10*d.*, or 1*s.*, and 1*s.* 6*d.* or 2*s.* a score was considered a high price. Now, last year I have frequently given 1*s.* apiece for two or three haddocks, and when I wanted them I could hardly get them. Then with regard to the trawlers, there can be no doubt about the injury they do. The fish will spawn on soft ground, and if they are running their heavy trawls over that soft ground it must necessarily be most destructive; wherever they come they must injure the fish. Of late years I have been in the habit of going frequently to Scarborough and Hull, and I have seen fish caught by the trawlers, not in the trawl net, but packed up in hampers. I am certain that if they were turned out on the sand here nobody would buy them at all. The scales were all rubbed off and the skin was broken.

5628. Where would it go to?—To the manufacturing districts.

5629. Do they not know what good fish is, then?—We who are accustomed to the line-fish here would not buy it, and I believe that a large quantity would have to be taken and thrown overboard.

5630–1. Can you tell us as a fact within your own knowledge that they do throw a large quantity of the fish they catch overboard?—No, I never was on board a trawler to see.

5632. We are glad to hear all you have to say, but we prefer facts to opinions?—I cannot give you any facts except with regard to the quantities of fish that were sent away from here in the winter time, before the railways were opened, in a pickled state. I can also tell you that the quantity of fish now landed here by the small cobles in the summer time is nothing in comparison with what it used to be. They may get a middling catch now and then, but where they get a good day's fishing they get nine or ten bad ones.

5633. Does any refuse from your alum works go into the sea?—Yes, but not to affect the fishing.

5634. How do you know that?—It is so very small in quantity.

5635. What is it?—It is the residuum and washings.

5636. Is it in a fluid state?—No.

5637. And do you not think that that may have frightened the fish from the shore?—No, it has been going on for the last 200 or 300 years.

5638. (*Professor Huxley.*) How long have you known this place, Mr. Westgarth?—For 60 years.

5639. Has the population increased?—Yes.

5640. The fishing population?—Yes.

5641. By how much has it increased?—By one third or one fourth or so.

5642. Do you say it has increased 30 per cent?—Yes, 30 to 35 per cent.

5643. Has the number of boats increased during your knowledge of the place?—The number has varied very considerably. There have been 15 or 16, and I have known them as low as 11 or 12.

5644. Then there has not been very much variation?—No; a few boats only.

5645. How has it been with regard to the small boats?—I think they will have increased in proportion to the population; they take three men in each coble.

5646. Then they will be a third more in number than they were 40 or 50 years ago?—Yes, but as to the quantity of fish there is no comparison; I have sent a boy down three days together for a few haddocks and have found that there has been none in the boats.

5647. Have you observed the condition of the inhabitants and the way they live?—Yes.

STAITHES.
G. Westgarth.
30 Sept. 1863.

5648. Have you observed any falling off in the comforts of the people?—No, I don't think so.

5649. Do they live much in the same way that they did 40 or 50 years ago?—Yes; if the fish were caught in the same quantity now it would not sell so high, but it would be of general advantage to the fishing population.

5650. Have the people any difficulty in setting up the boats they require?—No, I think not.

5651. The fishing population are going on as well as they did at that time?—Yes.

5652. Do you think that the amount of money they obtain for the fish now is as great as it was 50 years ago although the quantity of fish caught has fallen off?—Yes. I should think so, but there was no herring-fishing then. The herring-fishing was all carried on by Yarmouth boats at that time.

The witness withdrew.

J. Trattles.

JOHN TRATTLES called and examined.

5653. (*Mr. Caird.*) Have you been a fisherman here?—Yes.

5654. You are a shipowner now?—Yes, a boat-owner.

5655. You have not yourself been fishing for some time?—No. 50 years ago the Dogger Bank was always our best fishing ground. We used to go there principally to fish off the edge of the Dogger, and we always got an abundance of fish. For 25 years it was our study to get to the Dogger Bank for fishing, but for the last 15 years it has fallen off. During that period it has fallen off more and more every year. We always could get a cargo of fish as soon as we got to the Dogger Bank in my time.

5656. You are speaking now of when you used to go fishing yourself?—Yes.

5657. Is it 25 years since you used to go the Dogger Bank?—Yes.

5658. Is it within your own knowledge as a fisherman that there came a time when the fishing was less successful?—In my time we were always successful when we got to the Dogger.

5659. How long did that success continue?—For 25 years.

5660. Did it decrease when you were there?—It did decrease as soon as the smacks got to work on the south end.

5661. Was that during the time you were in the habit of going there?—It is 15 or 16 years since I have been there.

5662. Then you cannot tell us how it has decreased?—All that I know is that it has decreased.

5663. Have you yourself gone to the Dogger Bank and found that you could not get fish?—Yes.

2664. How long is that ago?—10 or 12 years ago.

5665. Did you often go to the Dogger Bank then?—Not very often.

5666. But when you did go you found a great difference in the fishing compared with what it had been in the previous times?—Yes, there was a wonderful difference. There was not one third part of the fish to be caught.

5667. What was the cause of that?—Because all the fish had been banished and the young destroyed.

5668. You are speaking now of 10 years ago?—Yes, and it has been decreasing ever since.

5669. How long is it since you first observed the trawlers coming to the Dogger Bank?—It is about 20 years since they came there.

5670. When did you begin to see the fishing on the Dogger Bank declining?—It has been declining for the last 20 years. There has been a regular falling off from year to year, until our fishermen are discontented and been prevented going to the Dogger at all.

5671. How many smacks were on the Dogger after you first noticed the fishing fall off?—I don't know. They trawled south of the Dogger and we used to give them a wide berth.

5672. Then you don't know how many were trawling there when you first noticed the falling off? No.

The witness withdrew.

(*Mr. Caird.*) Is there any other fisherman who desires to offer evidence?

There was no response, and the inquiry was then adjourned till Thursday, October 1, at Filey.

Filey, Yorkshire, Thursday, 1st October 1863.

PRESENT:

JAMES CAIRD, Esq., M.P. (Chairman). | Professor HUXLEY, F.R.S.

FILEY.
A. Pettit.
1 Oct. 1863.

The Reverend ARTHUR PETTIT called and examined.

5673. (*Mr. Caird.*) Are you the incumbent of this parish?—No, I am curate of the Iron church.

5674. Have you resided here for some time?—For about nine months.

5675. Have you made yourself acquainted with the condition of the fishermen here?—Yes.

5676. Can you give us any information with regard to their condition and complaints?—I find that their constant complaint is about trawling, because in their opinion it injures the spawn of the fish. Another of their complaints is, that the trawlers catch many small fish which are of no use for the market, and are by them thrown away.

5677. The trawlers do that?—Yes; and they complain also that the trawlers spoil a great number of fish.

5678. Can you give us any facts as to the number of boats and men engaged in the fishing here?—With regard to the number of boats there are 30 small boats and 47 larger boats engaged in the herring-fishery. The 30 cobles, which are engaged in the white-fishing, have three men in each, and sometimes three men and a boy. There are 27 larger boats called "yawls"; these yawls have six men each. The rest of the herring boats have fewer men.

5679. Are the yawls decked boats?—Yes, and there are 20 half-decked or quarter-decked.

5680. Do you know the number of men engaged in fishing here?—There are about 400 or 500, I believe.

5681. Will you be kind enough to give us whatever information you have in your possession with regard to the fishing here; we shall be glad to receive it?—I believe that the population of Filey—that is, the fishing population—has increased about one-third, or perhaps scarcely as much. The number of boats engaged in white-fishing is about 30, and each boat contains three men or three men and a boy. They go on an average for five days a week. A few fishermen follow small beam trawl-fishing. There are only two or three boats engaged in that way. They trawl during the summer, just within the bay. The herring fishery is the harvest. There used to be only 12 yawls, but they have now increased to 27.

5682. Can you give us the date to which you refer

FILEY.

A. Pettit.

1 Oct. 1863.

when you say that there used to be only 12 yawls?—That would be more than five years ago. In 1860 there were 24 or 27 boats destroyed by a wind.

5683-4. Within the last six or eight years has there been an increase from 12 to 27 yawls?—I cannot speak to that. Three years ago there were 27. The herring fishery begins about the middle of July, and lasts until the end of September. It is rather late this year. There are different kinds of fish caught here; they are chiefly the haddock, which is mostly caught in February, codfish, skate, a few whiting, and conger eels. They used to get a great many turbot before the trawling commenced, and soles were got with hooks. It was not uncommon to obtain four score in the bay 20 years ago, and they were all got by the hook. There is only a moderate supply of lobsters and crabs. There are but few rocks, which causes the supply to be inconsiderable. The supply of fish generally has fallen off from one-half to two-thirds.

5685. In what period of time?—During the last 20 years.

5686. Do you refer to the total supply of fish brought ashore?—Yes.

5687. Notwithstanding the increased number of boats employed?—I hardly know. I think the figures must refer to the catch of each boat. I believe that the number of men has not increased, although the boats have increased so many. There is a great complaint here that a soft ground, about 40 miles out, which they have regarded as the nursery for the fish, inasmuch as the fish used to spawn there, is now being constantly trawled over. There are upwards of 100 miles of trawling ground there. The trawlers came to Scarborough 20 years ago. Our fishermen used to get large quantities of cod there in the latter part of March, but they get none now.

5688. They caught the cod off that soft ground?—Yes. One fisherman told me that they could have taken up cod almost in their hands, and that now they get none. They used to get 800 head of fish a day in the small cobles which are used for white-fishing, and they often got 500 or 600, but now they may go fishing for eight days with only the same result. In every case they say there is a noticeable decrease since the trawling commenced. They have heard the trawlmen say that tons and tons of small fish are thrown overboard, killed, and wasted. Twenty years ago the trawlers came to Scarborough, and in the course of two years a piece of smooth ground, about four miles in length, was completely raked, and every description of fish that used to be found there was taken away. Now they have gone elsewhere, and the fish are increasing again; but in the course of two years they quite swept that fishery clean.

The witness withdrew.

BENJAMIN SIMPSON called and examined.

B. Simpson.

5689. (*Mr. Caird.*) You were a fisherman, I believe?—Yes.

5690. And now you are a fish salesman?—Yes, a fish salesman.

5691. Have you had a long experience of the fishing on this coast?—About 28 years.

5692. What different kinds of fish particularly are caught on this shore?—Cod, ling, haddock, skate, halibut, turbot, soles, plaice, thornback, and herring.

5693. Have you any shell-fish?—Yes, crabs.

5694. And lobsters?—Yes, and lobsters.

5695. Which of the two branches of fishing, the ordinary white-fishing or the herring-fishing, is the most profitable to the fisherman?—Of late years the herring-fishing has been most profitable, but in former times the white-fishing was. I think from 1840 up to 1850 I have caught from 300 to 400, 500, and 600 head a day, and now it would take you a week to catch six or seven score.

5696. Was that in the long-line fishing?—Yes, the long-line.

5697. Have you observed any falling off in the size of the fish as well as in the quantity?—I cannot say anything about that.

5698. Have you observed any particular fish that has fallen off more than another?—Yes, the halibut; that has fallen off very much.

5699. Do you get as many turbot now as you used to get?—No, nothing of the sort. I have been getting nine and ten in the course of a day by long-line fishing, and now they may go a week and cannot get one.

5700. Do you fish for turbot with the long-lines?—Yes.

5701. Have you never used a net for that purpose?—No.

5702. With regard to soles, are they increasing or diminishing?—They are diminishing very fast.

5703. Tell us what quantity you were in the habit of catching in a day's fishing 10 years ago?—There are other men who can give better evidence upon that point than I can, men who have been more used to catching them.

5704. Have you been accustomed to shell-fishing?—No.

5705. Is there any particular part of your fishing ground you have observed in which a deficiency has more especially occurred?—Yes.

5706. Where is that?—Off the Spurn Point. Twenty years ago we used to get 600 or 700 head of fish a day there; now they cannot get above 20 head, or three or four score at the outside.

5707. And that ground was at the Spurn Point?—Yes, about six miles east of the Spurn.

5708. When did that decline in the fish begin?—It did not begin until the smacks came.

5709. How long is that ago?—About 20 years. I cannot tell to a year or two; perhaps it may be 28 years ago.

5710. Is it 28 years since the smacks began to come on that ground?—I think so.

5711. Has the decline been progressive ever since. Has it continued to decrease until now?—Yes, our fishermen have now done fishing there altogether.

5712. When did they give over fishing there altogether?—Within these last four or five years; it is only an odd time now that we go there.

5713. Then where do you fish now?—Right off here, close to the Dogger Bank, and that is about clean now.

5714. Has it fallen off there also?—Yes.

5715. How far off is that ground?—About 35 miles.

5716. On the edge of the Dogger Bank?—Yes, in deep water.

5717. Has that falling off taken place lately?—It is about three years since I gave over. During the heavy gales that occurred in 1860 I lost my boat in Filey Bay.

5718. Were you in the habit of going to the edge of the Dogger Bank?—Yes.

5719. Did you get large fishings then?—How long ago do you mean?

5720. Twenty years ago?—Yes.

5721. Did you get as large fishings 10 years ago?—No, not so large.

5722. Had the fishing begun to decline then?—Yes.

5723. Was that on the ground the smacks began to trawl over?—Yes.

5724. Is there any ground near Filey Bay that you have observed to be declining in its yield of fish?—Yes, there is a piece of ground three or four miles from this.

5725. What kind of ground is that?—It is sandy ground.

5726. Was that formerly a good fishing ground?—Yes.

5727. For all kinds of fish?—Yes, cod, haddock, ling, skate, soles, and all kinds of fish.

5728. How long is it since it was a good fishing ground?—Perhaps 20 years. It has kept declining ever since.

FILEY.

B. Simpson.

1 Oct. 1863.

5729. When did the smacks first go on that ground?—About 20 years ago, or a little more.

5730. Then it is 20 years since you had any good fishing on that ground?—Yes, real good fishing.

5731. Where have you had any good fishing during the last 20 years?—We have not had any good fishing at all. When I first went we used to get as high as 18 or 20 score a day, and when I gave over 20 or 30 stone was considered a great deal.

5732. Have you ever seen a trawl net drawn up on a trawl-boat?—Yes, I have, but I have never been accustomed to trawling. At the same time, I have been on board a trawler when the net was drawn up.

5733. Is that long since?—About 10 years or more.

5734. On what ground was that?—Off Dimlington.

5735. How far off the shore is that?—Twenty-five miles.

5736. That is not the Dogger Bank?—No.

5737. Is that off any other ground you referred to in your previous evidence?—Yes.

5738. Then on some of that ground you say the fishing has been spoiled by the trawlers?—Yes.

5739. What came up in the trawl net when you saw it drawn up on deck?—There was not a deal in the trawl then; it was in the summer time. We went aboard in order to get a little bait.

5740. Were there any small fish in the trawl net?—There was not a deal of any sort when we were there. There were, however, a few small gurnets, and such like.

5741. Were they mangled at all by the trawl net?—I did not take particular notice.

5742. Was there any spawn in the net?—I cannot say.

5743. You saw nothing that would induce you to believe that the trawl was particularly destructive to the fish?—I did not take any notice; there were plenty of small fish in the trawl.

5744–5. Is that the only time you ever saw the trawl net hauled up?—Yes.

5746. Is there any mode by which in your opinion the trawl-net fishers and the long-line fishers could prosecute their business together without injury to each other?—I do not know. All I know is this, before they came there used to be plenty of fish, and now there is very little of any kind.

5747. What would be the remedy you would propose in order to bring back the quantity of fish there used to be?—I think all the fishing should be line fishing. They used to practise long-lining in the cod smacks.

5748. Do you think that you could catch as many fish by long-lining as they can catch now in a trawl smack?—Yes.

5749. Are you of opinion that you could keep the markets in the country as well supplied with fish as they are if you were to prevent trawling?—Yes, quite so; we used to supply them before.

5750. How long ago?—25, 28, or 30 years ago.

5751. How far do your fish go into the interior of the country?—To Leeds, Manchester, and all on that way.

5752. Were there facilities for sending the fish to market then?—We used to have to take them in vans.

5753. Then they could not be sent as cheaply or as quickly as they can now?—Yes, quite as cheap but not so quickly. As many carts used to go out then as now.

5754. Referring to the herring-fishing, I understand you to say that that has become of late years a more valuable fishing than the white-fishing?—Yes, except within the last two years, during which it has declined.

5755. Do you think the shoals of herring are not as great as they used to be on your coast?—Yes, and they are not so good.

5756. Not so large?—No.

5757. Has the number of boats employed increased or diminished?—It has increased.

5758. Have they been making as good a business of it?—Yes.

5759. Has there been any increase in the price of herrings?—Yes, here there has.

5760. What is the difference as compared with what it was five years ago?—This year it has been very low. Just now, at present, it is low, but there has been a good price, taking it altogether.

5761. Is there much difference between the price now and what it was five years ago?—I think it is better.

5762. Speaking of the price of 1,000 herrings, could you get as much for 1,000 herrings five years ago as you could get to-day?—Yes, as we could get to-day, because it is very low this week, and so it was last week; they have been as high as 20*l.*, and they are only 5*l.* or 6*l.* now.

5763. Twenty pounds for how many?—For 10,000. The fish is inferior.

5764. Taking into account the increased number of boats, are there as many herrings brought ashore here as there were 25 years ago?—No, not as many by a great quantity.

5765. Is there anything to interfere with your herring fishery here?—I cannot say whether the trawlers do or not. I cannot say that.

5766. Then you do not attribute the falling off in any way to the trawlers?—I cannot say, and it is of no use my stating that which is wrong.

5767. Are you at all disturbed by the French fishermen coming among you here?—Sometimes we are.

5768. Are you much disturbed by them?—Yes, but they are more disturbed on the Scotch coast.

5769. I am speaking now of your coast; do they interfere much with your operations?—Yes, they annoy us a good bit.

5770. Have you had any Frenchmen off this coast this year?—I cannot say; I have been ashore buying fish this year.

5771. From your experience as a herring fisher, do you think it would be advisable for Government to adopt any regulation as to the time for shooting the nets, and that it should make all the fishermen conform to it?—I do not know about that. I should say the proper time is just about an hour before sunset. The nets ought not to be shot before then.

5772. Do you think it would be any advantage that everybody should be compelled not to shoot their nets until a certain fixed time, so that one man should not have an advantage over another in that way?—I cannot agree with that.

5773. Do you believe it would be best to leave everybody to adopt their own opinions upon the matter?—Yes, I may want to go to sea, and another may not be so eager; and the consequence of adopting a regulation of this sort would be that however soon I might get there, I should have to remain until my neighbour came.

5774. Then you think it would be better to leave the fishermen to regulate these matters in their own way?—Yes.

5775. Not for the Government to come forward and interfere at all?—No, not with regard to shooting herring nets.

5776. Is there any law or authority to interfere with you now in the prosecution of your business as a fisherman?—I do not know that there is.

5777. Does anybody come here and ask you about the size of your nets, and the season at which you ought to fish for any particular kind of fish; is there anyone who enforces any regulation upon you at all?—No.

5778. Nobody enforces upon you any law that now exists?—No.

5779. You have not in your experience seen any fishery officer, or any other authority coming to Filey for that purpose?—I have heard tell of them, but I think the other fishermen here will give you better information on the matter than I can. I have heard some of them say that they have had their nets measured.

5780. You are a fish salesman, I believe?—Yes, at present.

5781. Where do you send your fish to?—To

London, Manchester, Nottingham, Derby, and other places.

5782. How do you regulate the particular market to which you send your fish ; how do you decide on which market you ought to send your fish to?—We get letters from the different markets every day, and we send to those at which we think we can get the best price for our fish.

5783. You send it to those which offer the largest price ?—Yes.

5784. Is there any particular kind of fish that you send to particular markets ?—Yes, the soles and turbots are all sent to London and Manchester, the cod-fish goes to Nottingham, Derby, and Manchester.

5785. Where are the herrings sent ?—They are sent to London, Manchester, Nottingham, Derby, Leeds, York, and other places.

5786. Which is the principal market for the fish caught in Filey ; where does the largest proportion go ?—A great part goes to London, and a considerable quantity to Nottingham and Manchester.

5787. How long is it since you began to be a fish buyer ?—Three years.

5788. Has there been any change in the prices during those three years ?—There has been a better price since I gave over fishing than there was before ; upon the shore here, at the seaside, the fish have brought more money than they did when I went to sea.

5789. The fish bring more money now than they did three years ago ?—Yes, at the seaside.

5790. And how is it with regard to Manchester, does it bring as much there ?—No, not so much by a good deal.

5791. How is that ?—There is so much competition here.

5792. Competition here ?—Yes, at the seaside.

5793. But that would not make the fish cheaper in Manchester unless there was a larger supply there ?—No.

5794. Has the fish to your knowledge been reduced in price at Manchester during the last three years ?—I cannot say what it was before, but I know what it is now.

5795. What was it three years ago ?—It brought more money then than now.

5796. Have you gone to Manchester with fish yourself ?—Yes, I have been there when a catcher ; I have been to Manchester with fish.

5797. Were you at Manchester with your fish three years ago ?—No, I was there 10 years ago.

5798. You were not there three years ago ?—No.

5799. Have you been in the market within three years ?—No.

5800. Not at all within three years ?—No.

5801. Are you aware of the cause why fish is fetching a lower price in Manchester now than it did three years ago ?—No.

5802. Is it because there is an increased supply in the Manchester market ?—No, I think not ; the trade is so bad up in the west country that I think that is the reason.

5803. There is a smaller consumption ?—Yes, ever since the American war commenced.

5804. Was the price of fish better two years ago than it is now ?—It was three years ago, but it was very bad indeed last year.

5805. (*Professor Huxley.*) Have you ever been selling fish in any market—your hooked fish ; I mean when there was trawled fish in the market ?—I have at Scarborough at the seaside, but not up in the west country.

5806. Did you find the price of fish lowered by the trawled fish being thrown into the market ?—Yes.

5807. You cannot get the same price for your hooked fish when the trawled fish is thrown in ?—No.

5808. Does the supply of trawled fish lower the price of fish generally ?—I do not know how that is ; I know that fish was cheaper before the trawlers came than it has been since.

5809. Cheaper before they came ?—Yes, I have known it sold here at fourpence a stone.

5810. Have you ever found yourself driven out of the market by the trawled fish ?—No, I cannot say that I have.

5811. Does trawled fish fetch as good a price in the market as hooked fish?—No; hooked fish will fetch more if it be fresh.

5812. Will it in the Manchester market ?—Yes, the codfish.

5813. Now do you think that people here know a trawled fish from a hooked fish ?—If they do know it they do.

5814. But do they know it ?—I should think they would ; one has all the gloss and the scales on, and the other has not.

5815. Do you ever get a better price for your hooked fish than the trawlers can get for theirs ?—I could do so on the seaside, but as I told you before I have never been up in the west country.

5816. 20 years ago did the fishermen get a higher or a lower price for their fish than they do now ?—They used to get a lower price for it.

5817. They get much more now for a stone of fish than they did then ?—Yes, sometimes here in the depth of winter I have delivered 107 stone of fish for 54*s*., and all last winter it was fetching nearly 2*s*. a stone.

5818. I understood you to say that the price paid in the market for your fish was not so much as it used to be ?—It has not been since the American war began.

5819. Then how is it that you can afford to buy your fish dearer and sell it at about the same price ?—We can not afford it at all ; we are doing no good. We are working for nothing; we get very little profit at all.

5820. How many years has that been going on ?—For the last three years.

5821. The dealers, then, are worse off than they were ?—Yes, a long way.

5822. Are the fishermen better off ?—I cannot say that they are.

5823. Do they get more money for their fish ?—No, they get less for it.

5824. On the whole you do not think they get as much money for their year's fishing ?—No.

5825. How many boats were there here fishing about ten years ago ?—About 12.

5826. Can you recollect what was the size of those boats ?—According to the old measurement they would run from 30 to 60 tons.

5827. Were they decked boats ?—Yes.

5828. Were there any small boats ?—Yes, there was a great quantity of small boats.

5829. Do you recollect how many ?—Twenty years since there would be 20 going herring catching.

5830. Twenty small boats ?—Yes.

5831. And how many boats were there going long line fishing ?—There would be about 10 small boats going out from here when the large ones were out.

5832. Were the larger ones principally employed in the long-line fishing ?—Yes, and they used to go off Hull, Boston, and Lynn. They would go also to Yarmouth and catch fish, but that is all done away with now.

5833. What is the cost of one of these boats used in long-line fishing ?—I have had one that cost 500*l*.

5834. How many tons was it ?—It was 39 according to the new measurement.

5835. Did it cost 500*l*. including the sails and fittings ?—No, the sails and ropes, the boat, the lines, and the nets were all separate.

5836. What would be the total cost to make it ready for sea ?—1,000*l*.

5837. Would the lines and the nets make that difference ?—Yes, it would not be a long way off.

5838. What did the little boats cost when they were fitted ?—Some of the small ones would cost about 22*l*., and others would cost about 60*l*. or 70*l*.

5839. Has the number of boats increased ; what is the number now ?—26, I think.

FILEY

B. Simpson.

1 Oct. 1863.

5840. Then that is rather a larger number?—Yes.

5841. Are you speaking now of the larger boats?—Yes.

5842. Is there a greater number of small boats?—No, they are about the same. There are 20 now. They got diminished to only one once, and then they got up to 20 again.

5843. Within the last 20 years there has been a considerable number of boats added to the large boats?—Yes, about 13.

5844. That has almost doubled the number?—Yes.

5845. From your knowledge of the fishermen are you enabled to say that most of these boats have been paid for or are they mortgaged?—Most of them have been paid for, all of them I think. I do not suppose there is a mortgage upon one of them.

5846. Then to say nothing about the wear and tear of the boats, there must have been something like 13,000*l.* paid for new boats and fittings during the last 20 years?—Yes, or perhaps you had better call it 10,000*l.*, you would be about right then. Of course that includes the gear, the nets, and everything.

5847. Do you know how many fishermen there are in the place?—About 130.

5848. Are there not more than that?—I do not suppose there are.

5849. How many are there in each of the large boats?—Nine.

5850. Then there must be more than 130?—Yes, but not what you would call proper bred fishermen.

5851. How many owners of boats are there in the place, or part owners, or share owners?—I cannot say, there are some of the owners in Scarborough.

5852. Are the boats not owned by Filey men?—No, the men who go in them are Filey men, but there may be Scarborough men who have part shares in them.

5853. How many men will take a share in a boat?—Two or four.

5854. Do you think that the property of most of the boats is in the Filey men?—Yes, most of them.

5855. Suppose we say there are 200 fishermen, will that be the outside number?—Yes, if you mean proper bred fishermen.

5856. Men who take part in owning the boats?—They do not own the boats; they go in them, but they do not own a part.

5857. How many, taking a rough estimate, have an interest in the boats?—I cannot say.

5858. Do you think there are 150?—I question if there are as many as that.

5859. You doubt whether there are so many?—Yes, you may say 100, and I think you will not be far under the mark.

5860. Then during the last 20 years these men have been enabled to pay 10,000*l.* for new boats?—The boats do not all belong to the fishermen.

5861. Do they belong to merchants in the town?—Yes.

5862. Does any large proportion of them belong to merchants in that way?—Some will have a quarter, some one half.

5863. Are the merchants of this town disposed to invest their money in that way?—No, they are not, unless it is that a body being overset with a boat asks them to take a quarter or so.

5864. Do the fishermen prefer to have them themselves?—Yes if they can, but when they are beat they look out for a friend.

5865. Do the fishermen get ready money in that way usually?—No.

5866. Do they pay interest for it or do they make the lender of the money part owner?—A man stands a part, and receives his benefit from the boat.

5867. But somehow or other the money has been found in this place during the last 20 years, and it has amounted to something like 10,000*l.* for fishing boats?—It has been got somehow or other, but I cannot say when, nor how, nor in what way.

5868. (*Mr. Caird.*) Are your large boats big enough to follow the trawl-fishing?—They are not strong enough, or else some of them are large enough.

5869. Has it never occurred to your fishermen to try that kind of fishing?—No, we think it will not answer; we think it would pull them to pieces.

5870. Is your harbour here adapted for boats to come in, the size of trawl-boats?—No, we want a harbour very badly.

5871. Would a harbour be of great benefit to the fishermen?—Yes; from the want of a harbour I have myself lost two boats. In 1844, owing to the want of a harbour, three boats and all hands were lost. I was out with them, and we tried to get into Scarborough, and we had to run ashore, and our boat was the only one that was saved.

5872. If you had a harbour do you think your fishermen would adopt trawl-fishing?—I cannot say anything about that.

5873. Have you heard that the trawl fishermen make a better business of it?—I do not think they do. I know for myself that I did not make a good business of it.

5874. Were any of the new boats to which you refer provided by fishermen coming from other places, or do they belong to the native fishermen?—They all belong to here.

5875. Have you not had any fishermen who have come from other places and settled here?—We have had some who have come here from the south, but they have not got any boats or anything of that kind.

5876. Then the increase in the number of boats has not been from strangers coming to the place?—No.

5877. It has been confined to the people themselves?—Yes.

The witness withdrew.

D. Crawford.

DAVID CRAWFORD called and examined.

5878. (*Mr. Caird.*) You are a fisherman here?—I am not a fisherman at present, but I was about 18 years ago, and I was a fisherman for about 17 years.

5879. For 17 years previous to that?—Yes.

5880. And since that for the last 18 years have you been a fish buyer?—Yes.

5881. In the course of your experience over so many years have you noticed any marked change in the quantity of fish brought on shore here by the fishermen?—When I went fishing 24 years ago we got as much fish in one day as we could get now in six, and on the same ground. Where we used to fish 24 years ago was in 24 and 25 fathoms of water. Just before the smacks came among us we could go and get from 20 to 25 score a day and now at the present time we may fish six or 10 days for 25 score.

5882. Has that falling off been in any particular kind of fish or in all kinds?—In all kinds, especially in cod and haddock.

5883. Has the size of the fish decreased as well as the quantity?—There is not so much difference in the size, but there is a great deal of difference with regard to the scarcity of the fish.

5884. Have you a good supply of bait here?—We have not a very good supply of bait.

5885. Where do you get your bait?—We generally get it from Boston Deeps.

5886. Have you none on the coast here?—We have flitters or limpets as you call them.

5887. Have you no mussels on your shore?—There is a little spawn but they come to no perfection.

5888. Have you never had mussels here fit for bait?—No.

5889. Have you always been in the habit of getting them from a distance?—We have always brought them from Boston Deeps.

5890. Has the supply been equal to your requirements. Have you always had enough without any difficulty in obtaining it?—Yes; we have always had sufficient bait.

5891. Has the price increased at all?—No.

5892. Then the falling off in the fishing has not in any way been occasioned by a difficulty in obtaining bait?—Not at all, we have as good bait now as we had then although it is rather scarcer.

5893. What do you think is the falling off of the catch of fish?—The only true evidence I can give you is just this, the supply began to fall off about 24 or 26 years ago just when the trawl-fishing commenced. We used to fish up to 24 or 27 fathoms of water and we could get plenty of fish. After seven or eight years we were altogether banished from that ground, which was north-west of Flamborough Head, and we had to come into 24 fathoms of water. The trawlers followed us down there. Formerly we could get as many fish as we liked, and now there is not one fourth part of the fish to be got there that there was formerly.

5894. Were you ever in the habit of fishing on the Dogger Bank?—Yes.

5895. Do you perceive any falling off in the quantity of fish you used to get there?—Where we used to get 150 stone of halibut in a day and sometimes 200 stone we might now fish for six days for 100; there is just about that difference.

5896. And how do you think the trawl-boats have operated in diminishing your catch?—The only evidence I can give on that point is this, I consider that where they can get one ton of valuable fish to bring to the land there are two or three tons of small fish that are wasted and thrown overboard.

5897. Have you ever been on a trawl-boat when the trawl was drawn up?—Never, but I have frequently had conversation with men who have been trawling.

5898. You were never alongside when the trawl was hauled up?—No.

5899. Have you bought trawled fish?—Yes.

5900. In what state were they when you bought them?—They were hardly fit to eat.

5901. Had the vessel been long at sea?—They cannot get in exactly when they wish, sometimes they are two, three, and even four days before they get in.

5902. Speaking of trawled fish as compared with fish caught by the long-line, have you noticed any marked difference between trawled fish and long-line fish?—Of course there is a great difference. It is generally six hours before the trawl is taken in and the fish are dead before they are hauled up.

5903. Do you buy trawled fish at the same time as long-line fish?—Yes, I have done so occasionally, but very seldom.

5904. Can you give us any comparison of what you paid for cod caught in the trawl and cod caught by the long line?—Sometimes we can buy trawled fish for 6*d.* and 9*d.* apiece while we always reckoned that our long-line fish would fetch 1*s.* 6*d.* or 2*s.*

5905. Would that be for fish caught on the same day?—Yes.

5906. Fish coming ashore at the same time?—Yes.

5907. Fish equally fresh?—The fish would not be equally fresh, but there would be very little difference. If I had a quantity of fish set before me now as a fish buyer, some of it caught by the trawlers and some of it caught by our long-lines, I would give a shilling a head more for the one than the other.

5908. Would you do that without even looking at it?—Yes.

5909. Would that be because you believe the trawled fish would be inferior?—Yes.

5910. Is it not the case that the fish is sometimes alive when brought in by the trawl-boats?—There may be some, but it would be very few.

5911. Then you might make a mistake in the price you give in that way?—We always reckon a long-line fish to be worth double as much as a trawled fish. The fish cannot be so good after they have been dragged along for six hours at the bottom of the sea.

5912. Have you ever gone to Manchester market with your fish?—No, I never was at Manchester.

5913. Have you ever been at any other market?—None but Hull.

5914. Is that some time ago?—Yes, 20 years ago.

5915. If I understand rightly you had no trawled fish then?—No, very little.

5916. Then you cannot tell us the difference in the price between trawled fish and long-line fish in the market?—I can prove that our fish is worth two shillings a stone, and that trawled fish is not worth one shilling.

5917. Is that in the Manchester market?—In Manchester, Liverpool, Leeds, Sheffield, Nottingham, and other places.

5918–9. How do you know that?—I have had an account to-day.

5920. Were they in equal condition?—I cannot say.

5921. Then you cannot really draw a comparison?—All the statement they give us with regard to trawled fish is simply that trawled fish is at such a price.

5922. Have soles fallen off much here?—We never have many soles here. What they catch here they catch generally by the hook.

5923. Do you catch any mackerel here?—Yes, we have got a good many this summer.

5924. Is mackerel-fishing followed as a business here?—Never before last year.

5925. Have they begun to get mackerel nets here?—No.

5926. Do they catch them with the herring nets?—No, they catch them with hooks.

5927. Is that found to pay well?—Yes.

5928. Do the mackerel come in with the herring? They come in the same season, in August.

5929. Have they ever been here when the herring were not here?—No.

5930. Are there any sprats caught here?—No.

5931. Has the herring-fishing diminished or increased?—It has diminished a good deal.

5932. To what do you attribute the diminution?—To nothing but the trawlers taking up the spawn.

5933. Do you think that the shoals of herring are not as strong as they used to be?—No.

5934. Do you not find that you may have a good season one year, then a bad season, and then a good one again?—Yes, but I take it from 20 years ago, and I am quite satisfied that they are not as plentiful as they were 20 years ago, and that the quality is not as good.

5935. Have you as many herring boats now as you had 20 years ago?—Yes, we have 13 large boats more.

5936. What was the number 20 years ago?—13.

5937. And how many have you now?—26 or 27.

5938. How long is it that the Frenchmen have been off your coast?—I do not know.

5939. Do not they come off your coast?—I have not seen them this year.

5940. How is the price of herring this year compared with what it was last year, and in previous years?—The price is not so good as it used to be; it has not been so good this year, buying them on the beach, as it was last year.

5941. Do you mean that you do not give so much to the fishermen?—No.

5942. Do you get as much for them in the market towns that you send them to?—No, if we did we should have to give more for them.

5943. You cannot speak so much here as at other places with regard to the interference of the French fishing boats with the herring-fishing?—When I went to sea they used to interfere very much with us. I do not know whether that is the case now or not.

5944. Is there a large fishing here for crabs and lobsters?—Yes, we have a very fair and good fishing of both crabs and lobsters.

5945. Does that continue to be as good as it used to be?—No.

5946. Which particularly has fallen off?—Lobsters.

5947. What is the cause of that?—I am sure I cannot say.

FILEY.

D. Crawford.

1 Oct. 1863.

5948. Are they more closely fished than they used to be ?—No, I do not think there are any more men engaged in catching them than there used to be.

5949. Are they not fished over a greater part of the year than they used to be ?—No.

5950. Are not the small fish caught more frequently than formerly ?—In the winter time, about Christmas, they catch a few lobsters.

5951. Have the crabs not diminished in the same proportion as the lobsters ?—No, I do not think they have.

5952. I understood you to say that you have been a purchaser for the last 17 years ?—Yes.

5953. Taking this year and comparing it with 10 years ago can you buy as many crabs and lobsters now as you could then ?—Not as many lobsters but as many crabs.

5954. Has there been a change in the price of the fish since then ?—There has been a little change ; the price both of lobsters and crabs has been rather dearer.

5955. Do you think the fishermen here are making a good business of it ?—At present I am sure they are not.

5956. Last year did they ?—Last year they did pretty well.

5957. Did they do as well as they did 20 years ago ?—20 years ago they used to go to Yarmouth.

5958. Then 10 years ago ?—I cannot say that there is any difference between last year and 10 years previous.

5959. (*Professor Huxley.*) You were speaking of the long-line fishermen having been banished by the smacks from where they were accustomed to fish ?—They were not exactly banished, but they left because they could not get any fish. 30 miles off Flamborough Head to the north-west of us we used to get plenty of fish 22 years ago, but as soon as the smacks came there the quantity fell off.

5960. Was the diminution so great in the first year the smacks came that you could get no fish ?—The fish gradually diminished.

5961. How many years was it before you found it not worth while to fish there at all ?—In the course of four or five years we were forced to leave the place.

5962. Did the smacks go over the ground the whole of that time ?—Yes.

5963. Do they go there now ?—Yes.

5964. Then they find fish there ?—The fish they catch is not what we caught. We think that they have ruined the ground by taking the spawn up.

5965. Do you find that the trawlers ever interfered with you by dragging your lines ?—They have occasionally broken us adrift.

5966. Did you ever have your lines carried away by a trawler ?—Never, but they have occasionally trawled over the lines I had put out, and thus have broken us adrift.

5967. Did you ever find that they could go over your lines without bringing them up ?—Yes ; it would not bring their vessel up.

5968. In trawling over your ground did they ever carry away your lines ?—They never carried away mine.

5969. Have you ever seen them go over the ground where your lines were set without bringing them up ?—Yes.

5970. Then do you think that trawling may be engaged in where long-lines are set without bringing them up ?—Not always, but occasionally it may.

5971. Do you know of any fisherman who ever suffered great injury by reason of his lines being taken up ?—Yes ; I have known two or three instances.

5972. Is it a thing of frequent occurrence ?—No.

5973. You say that you do not consider trawled fish good to eat ; why is that ?—It cannot be good for much after it has been dragged over the ground for six or 12 hours at the bottom of the sea, and then kept for two or three days in the boat.

5974. Do you think that being in the trawl for six hours would render the fish unfit to eat ?—Yes, some of it.

5975. Would the fish be bad to eat ?—I should think so ; some of it would be dead.

5976. Is a fish bad when it has been dead six hours ?—It would be when it had been kept three days.

5977. But if your line fish were kept three days it would not be particularly sweet, would it ?—It would not take much harm.

5978. Do you think that trawling makes the fish bad ?—I do.

5979. Have you ever seen fish come out of the trawl-boat bad ?—I have seen it come out of the smacks bad.

5980. Have you ever eaten trawled fish ?—No.

5981. Then it never made you ill ?—No.

5982. Did you ever hear of its making people ill ?—No ; but I have heard of its being seized, though.

5983. You heard what the previous witness stated respecting the increase of the number of boats during the last 20 years ?—Yes.

5984. Do you agree with that ?—Yes.

5985. Do you agree with him as to the cost of the boats ?—I know that one of our boats would cost 600*l* bran new, to get everything in her, without the nets and lines.

5986. What would the nets and lines come to ?—Close upon 300*l*.

5987. Then do you think that it was an overestimate to say that a boat completely fitted would cost 1,000*l*. ?—I think that is rather above the cost.

5988. What sum would you put it at ? 800*l*. or 900*l*. ?—About 850*l*. is as near as I can come.

5989. Do you agree with the last witness as to the boats being free from mortgage for the most part ?—Yes ; I do.

5990. You are a business man, now let me put this to you : It is difficult for me to understand the exact position in which you are. You state that the fishery has been falling off, and that the fishermen have not earned what they did previously, and I want to know how, under such circumstances, they have contrived to put this large amount of capital into new boats ?—That is a difficult point for me to explain. There may be different persons who own the boats ; for instance, there may be three or four persons owning one boat. Some years ago there were nine boats entirely wrecked. My father had one and my brother and sister another, and when I came back from Sheffield, at the time they were destroyed, they did not know where to get another, but they got up a subscription, and having got friends who stood a part, they got another. I think it would be found to be the same in a variety of instances if the cases were fairly investigated.

5991. Was the money absolutely given, or was it lent ?—I believe it was partly given. I think more of it was given than lent.

5992. I do not wish to go inquisitively into this, I only wished to ascertain how it was that so large an amount had been invested ?—The money was freely given ; if it had not been for that many of the fishermen would have been set fast.

5993. Thirteen boats of the value you have mentioned would cost something like 10,000*l*., do you believe that that sum has been given in the course of 20 years to the fishermen of Filey ?—No, they have earned it themselves.

5994. Then my difficulty is this, how, if the fishing has fallen off, can they have contrived to save 10,000*l*. and invest it in new boats ?—Some of them have had to borrow the money.

5995. But then they have had to pay interest for it ?—Very likely they have ; I do not know.

5996. Have you ever set turbot nets upon this coast ?—No.

5997. Is it not the practice here ?—No, not here.

5998. Did you ever find that you were annoyed by the price of fish being lower in any of the markets you supply than you thought it ought to be ?—Yes.

FILEY.

D. Crawford.

1 Oct. 1863.

5999. Did you ever find that injure you ?—Yes, many a time ; often we have not been able to get the price we ought to have.

6000. You have not been able to get the price you would have got if the trawled fish had not been there ?—Yes, a large supply of this inferior fish in the market generally or partially spoils the sale of ours.

6001. So that the influx of trawled fish damages the sale of yours ?—Yes, to a great extent.

6002. (*Mr. Caird.*) You were speaking just now of some of your boats having been lost in bad weather ?—Yes.

6003. Have you any refuge you can run to here in bad weather ?—We have nothing here ; we can only run into the Humber.

6004. You have no refuge in your own bay ?—No, if the wind be southward or eastward or up in the south-east.

6005. Can the large boats run in ?—No, they must keep at sea or run into the Humber.

The witness withdrew.

JOHN JENKINSON called and examined.

J. Jenkinson.

6006. (*Mr. Caird.*) Have you long been a fisherman here ?—About 63 years.

6007. Are you still a fisherman ?—Yes, but I do not go out in the large boats now.

6008. Do you agree with the last witness as to the falling off in the quantity of fish caught on this coast as compared with what it was formerly ?—Yes.

6009. What do you think is the cause of that ?—I should say it was the trawling that has done it.

6010. When did you first notice the falling off ?—I have seen it ; I was a trawler myself about 28 years ago.

6011. How long were you on board a trawl-boat ?—About a year.

6012. Where did you hail from ?—Scarborough.

6013. In what way did you see the injurious effect of trawl-fishing ?—We used to trawl for about six hours either north or south, and when we took our net in we had always a great deal of young fish, spawn, and such like. After we had taken out of it what fish we required we used to take a shovel and shovel the rest overboard. There would be fish among it of this length (*measuring*) young cod, skate, whiting, and other fish.

6014. Were they dead ?—Yes.

6015. And they were entirely lost ?—Yes.

6016. Was a large proportion of the whole fish of that character ?—As nigh as I can tell there would be about three bushels of it.

6017. How many bushels would be there altogether ?—We had a great weight of soles and haddocks.

6018. Do you refer to any particular time, when you say you saw three bushels thrown overboard ?—No, we threw over about that quantity nearly after every drag.

6019. How many would there be that were not thrown overboard ?—Not more than two bushels.

6020. Then you threw overboard more than half of the whole draught ?—Yes, sometimes three times as much as we took.

6021. You are speaking now of 27 years ago ?—Yes.

6022. There was no sale then for this small fish, was there ?—No, we could not bring it to land, it would have been putrid before we got it in.

6023. Was there any spawn in the nets ?—There was what we call spawn, but what it was I cannot tell ; it was much knocked about with dragging in the net. We had crushed it all to pieces. It was just like a jelly when we got it in. We supposed it to be spawn.

6024. Was there much of it ?—Yes a great deal, and a good deal of small fish too.

6025. Between the spawn and the small fish there would be about three bushels ?—Yes.

6026. And that was a common thing ?—Yes.

6027. Did the large boats get more in a week's fishing than a line boat would get ?—No, but they destroyed a great deal more.

6028. Did they not get more fish to the land ?—Not a quarter. I have caught more in four hours than they have got by trawling in a week.

6029. Then it must have been a bad business for them ?—We could not make anything of it in those days.

6030. Have you had any experience of the herring-fishing ?—Yes.

6031. Do you find it falling off ?—Yes.

6032. Are you at the herring-fishing now ?—No, I am not ; it is about three years since I gave over.

The witness withdrew.

EDMUND CRAWFORD called and examined.

E. Crawford.

6033. (*Mr. Caird.*) Are you a fisherman here ?—No.

6034. What is your business ?—I am a fishmonger at present.

6035. Have you ever been a fisherman ?—Yes ; I have been in my present business three years only.

6036. And previous to that you were a fisherman ?—Yes.

6037. Do you agree with the previous witness as to the falling off in the quantity of fish caught off here ?—Yes.

6038. Does that apply to all the fish caught off here ?—I think so.

6039. Does it equally apply to herrings ?—I do not believe there are half the herrings caught off here now that there were 10 years since, if the boats had had as many nets as they have now. The boats used to fish with 50 or 60 nets, and now they have 120 and 130, and they do not get more with their 120 and 130 than they used to get with 50 and 60.

6040. Do you think the increased number of boats and nets does not give so much ?—No.

6041. What is the cause of that ?—There are not so many herrings to catch.

6042. What is the cause of that ?—I cannot say ; there is a diminish.

6043. You know no reason for it ?—No, unless it is that the trawlers take the spawn. Ten or 20 years since they would get a boat's load in a night.

6044. What is the cause of the falling off in the white-fishing ?—The trawling.

6045. Have you been on board a trawler ?—Yes, once or twice.

6046. Have you seen the trawl drawn up ?—Yes.

6047. What have you seen in it ?—I have been on board at Dimlington to get bait, and I have helped them to get in the trawl, and I have seen several bushels of fish about the length of my finger thrown overboard. There were more tossed overboard than were kept.

6048. Did any of them appear to have been mangled or hurt by the trawl ?—They were always very soft and scored, the haddock especially, as if they had been scraped with a knife.

6049. How long is it since you have been on board a trawl-boat ?—About six or seven years ago. I have been three years ashore.

6050. Do the trawl-boats come off your shore ?—Yes.

6051. Do they come in increasing numbers ?—Yes.

6052. Are there more now than there were last year ?—Yes, in our "outsand" fishing.

6053. Is that the place the former witness referred to as having been raked clean of fish ?—They come

FILEY.

E. Crawford.

1 Oct. 1863.

in now on those grounds, to fish for soles and haddocks.

6054. Do they find plenty of fish?—They find a few, but not so much as they did.

6055. Do more trawlers come now than used to come?—Yes.

6056. Do they not find fish when they come?—Yes, a little.

6057. From your own knowledge does a trawl-boat make a better business of it than a line-boat?—I do not think they make as good.

6058. Can you speak of that from your own knowledge?—No, but I do not think they do. They do not earn half as much as many of our line-boats, but they are not at half the expense.

6059. Do you find the markets to which you send your fish supplied now in an increasing or dimishing ratio?—The markets are only very poorly supplied at present.

6060. What is the cause of that?—I cannot say.

6061. Do you say they are not well supplied?—There are plenty of fish; we have nothing but herring here at present.

6062. In the large markets, such as Manchester and the places to which you send your fish, have they plenty of white fish?—They have only been middling off these last two years.

6063. Are you speaking now with regard to price?—Yes.

6064. During the time the herring-fishing is followed here, how long does it last?—About 20 weeks.

6065. Do your men not catch white fish at that time?—Not much.

6066. Is it always discontinued at that time?—Yes.

6067. Do the trawlers discontinue fishing at that time?—No, I think not.

6068. Do you get any mackerel off this shore?—There have been a few got off this shore, but not many.

6069. Do the fishermen get a good price for the mackerel?—Middling.

6070. Does it pay the fishermen to attend to that business?—I do not think it would pay them if any number of them engaged in it. There are only a few boats that go round the bay now. If there were any large number of fishermen they would do no good.

6071. Does anybody interfere to regulate the fishing, I mean in regard to the size of the nets, or the time of fishing?—No.

6072. Do you think it would be to the advantage of the fishermen that they should have some Government interference with them?—I think not.

6073. You would rather not be interfered with at all?—No.

6074. Do you know whether the French fishermen interfere at all with the herring-fishing?—I believe they do.

6075. Do you know that of your own knowledge?—I have been interfered with, and I have had my nets cut away.

6076. Do they come within the three mile limit?—Yes.

6077. Does anybody tell them that they shall not come there?—No.

6078. Did you when you were fishing get a larger proportion of your catches of herring within or without the three-mile limit?—Sometimes I have got a good deal only half a mile off.

6079. But, taking the whole herring season, where is the largest quantity caught?—On the off side.

6080. That is where the Frenchmen are entitled to come?—Yes.

6081. Can you both fish together without interfering with each other?—Yes, if we kept off each other. What causes the destruction is the nets being set together. Their boats are much stronger, and their nets are as strong again as our nets, and if they come upon us they knock us to pieces.

6082. Can you see the shoals of herring from the shore before the fishermen start?—No.

6083. Do you think it would be of advantage if any plan could be adopted by which any signal could be given to tell where the shoals of herring are?—I do not know how such a signal could be given.

6084. Could not a watch boat be stationed off the shore, and be enabled to signal?—No, you cannot find any except in the night time.

6085. Do you shoot your nets before night-time?—Yes, and often when they haul them in again they get nothing in them.

6086. Do not you see any before night-time?—Very seldom.

6087. Has there been any improved system of fishing adopted during the last 20 years for either line or herring net-fishing?—I do not know that there has been any improvement; there has been an increase.

6088. Do you mean in the quantity of boats and nets?—Yes.

6089. But there has been no change in the mode of catching fish?—No.

6090. It is just the same now as it was formerly?—Yes.

6091. Have you found it to be quite as successful?—There are double the quantity of nets; that is all.

6092. Do you use the same kind of boats that you did formerly?—Yes.

6093. (*Professor Huxley.*) You heard what the last witness said about his business being damaged by the influx of trawled fish?—Yes.

6094. Have you found the same result?—Yes.

6095. Do you think the sale of trawled fish in the market operates injuriously on the sale of white fish?—Yes, a good bit.

6096. Does it do so always?—Yes.

6097. Are you in the habit, during the herring fishing here, of fishing in undecked boats?—I was never in an undecked boat herring fishing in my life.

6098. Then the boats you generally fish in are decked boats?—There are 26 decked boats, and 20 undecked.

6099. All of them employed in the herring-fishing?—Yes.

6100. Do the French boats interfere with the decked boats as well as the undecked?—Yes.

6101. How is that?—The tide sets them all together.

6102. Does it not set you together when you go fishing by yourselves?—Yes, we are all together, the French and all of us.

6103. Do the French boats interfere with you more than any other boats?—I do not know that they do. We try to gets our nets up without tearing or wasting them, but the Frenchmen never care about our nets at all.

6104. You say that their tackle is stronger than yours?—It is as strong again. Their boats have 26 men on board; our small boats have only three, and the large ones eight or nine.

6105. If your boats all go out together, do you all shoot together?—Why if we think there is a chance of herring we go as near as we can.

6106. Do your decked and undecked boats keep away from each other?—No, they go as nigh the shoal as possible.

6107. Have you heard of any law upon that subject?—I have heard of it, but I never knew of its being put in force.

6108. No gunboat ever comes to put it in force?—I saw once a north country boat at Staithes bray our barrels in while we stood looking at them.

6109. Have you had no one to tell you what the law is?—No.

6110. Do your herring boats carry any lights at night?—Yes.

6111. What sort of lights?—Generally a lantern, in a piece of wood which stands seven feet high.

6112. Do you have one light or two?—Only one.

6113. Did you ever hear of any law obliging you to have two?—Yes, I have.

6114. Did you ever trouble your heads about it?—I do not think we ever have.

6115. Nobody has ever found fault with you?—No.

FILEY.

E. Crawford.

1 Oct. 1863.

6116. Did you ever have any gunboat or any fishing vessel on this coast?—I have seen gunboats, both French and English.

6117. Do they ever interfere with you?—They never meddled with us.

6118. Do they interfere with the French if they come within the three-mile limit?—No.

6119. Then what was the good of them?—I do not know.

6120. What is the size of your herring nets?—31 cotton and 31 hemp.

6121. Do you mean 31 to the yard?—Yes.

6122. Did you ever have 36 or 39 to the yard?—Yes, I have seen them of that size for fishing little herrings, in Bridlington Bay.

6123. Is there any reason why you should not have your meshes 40 to the yard?—No, I think not. We just have them as we like.

6124. Does nobody ever look at your nets?—No.

6125. Do you know of any law upon that subject?—No, there was some talk about it four or five years ago, but we heard no more of the matter. I had a small net and I sold it for 5*s*., and the man I sold it to has been trawling with it ever since for anything I know.

6126. You have been a long-line fisherman?—Yes, for 20 years.

6127. I think you said you use the same bait for all kinds of fish?—Yes; we generally use mussels.

6128. Do you ever use a herring?—Yes, for cod.

6129. And when you cannot get that you use mussels?—No, we never use mussels; lampern eels are the best bait for cod-fishing in the winter time. They are the best bait we can get.

6130. Is that a good bait?—Yes, for codfish.

6131. Have you had any difficulty at all in keeping up a good supply of bait?—No, there is plenty of bait in Boston Deeps since we made them give over taking it for manure.

6132. Who interfered and prevented that?—The Lynn authorities at Boston.

6133. Do you mean the corporation?—Yes, I believe they interfered. Before that the bait used to be taken away by cartloads.

6134. Have you been in the habit of losing much by the dog-fish?—Yes.

6135. How much out of your fish will they take?—They generally take haddock, sometimes a few cod. Haddock they will clean off almost directly, if there be any.

6136. Do you lose any considerable portion of your fish in that way?—Yes, in the winter time I have seen as many as two or three score of haddock heads left on the line.

6137. The heads only?—Yes, nothing but the heads.

6138. Do the dog-fish do you more damage than the suckers?—The dog-fish do us most damage; the suckers do not do so much harm.

6139. Do you agree with the previous witnesses as to the cost of your fishing boats?—Yes, I think a good boat will cost about 1,000*l*. I do not think any man would get one under 1,000*l*. I have been an agent to a firm for the sale of nets, and I do not think a fisherman would get a fleet of nets under 200*l*., if he would even get one for that.

6140. There has been an increase in the number of nets used during the last 20 years?—Yes.

The witness withdrew.

W. Jenkinson.

William Jenkinson called and examined.

6141. (*Mr. Caird.*) Have you been a long-line fisherman here?—Yes.

6142–3. Are you still a fisherman here?—Yes.

6144. Do you agree with the previous witnesses as to the falling off in the quantity of fish caught?—Yes.

6145. What particular kind of fish has fallen off?—The codfish has fallen off. On the Dogger Bank we used to get plenty, and now if we fish there for a week we get very few indeed. The quantity caught there has been falling off ever since the trawlers came upon the bank.

6146. How long is it since you have observed the trawlers?—I saw them first about 30 years ago.

6147. Have they been coming off your shore during the last 30 years?—Yes.

6148. Have they been coming within four miles of your shore during that time?—Yes, within four miles of our shore, but the most harm they have done has been on the south coast, on the soft ground.

6149. Have you soft ground four miles out?—Yes.

6150. And have the trawl-boats been coming on it?—Yes, they have been for 26 or 27 years on that ground.

6151. Do they still come?—Yes.

6152. Are they as numerous or more so than they were formerly?—Just about the same.

6153. Are they quite as numerous as they used to be?—Yes.

6154. Do you set your lines there?—No.

6155. Why do you not set them?—Because we are afraid of the smacks taking them away.

6156. Do they take away your lines?—Yes.

6157. Have you ever lost your lines by the smacks?—I do not know that I ever did; there are people in this room who have done so. When we fall among these smacks we are afraid to set our lines, and we generally come away.

6158. Did you ever observe a trawl go across your lines?—Yes, many a time.

6159. Did it cross them without hauling them up?—No.

6160. It hauled them up?—Yes, and they were carried to Scarborough.

6161. Do you ever see a trawl net drawn up on deck?—No, I never saw one.

6162. Then you cannot tell us the contents of a trawl net?—No, but I have heard a fisherman say that he has seen a ton and a half thrown overboard.

6163. Have you long been a herring fisher?—Yes.

6164. Do you find that the herring-fishing has fallen off?—Yes, it has fallen off a good bit.

6165. Has not the number of boats increased considerably?—Yes.

6166. Does not each boat make as good a business of it as it used to make?—They may get a good season by chance, but it has fallen off very greatly during the last two years.

6167. What is the cause of that?—The smacks are the reason; they fish in the daytime, and we at night. We dare not come among them when they are fishing, we are obliged to go to one side, and we are forced to go outside somewhere or other.

6168. Do the trawl fishermen come among your herring nets when you are fishing?—Yes.

6168*a*. Do they get foul of your herring nets?—Yes.

6169. Have you ever had any of your herring nets fouled?—No.

6170. At what time are you in the habit of shooting your herring nets?—About an hour before sunset.

6171. Do all the fishermen conform to that custom?—Very few shoot before sunset.

6172. Would there be any advantage in having a law to compel them to shoot their nets at a certain time?—There could not be a law without interfering with the herring-catching, because the herrings are always taking their course.

6173. You think there would be no advantage in having a law?—The best law would be to keep the smacks away. If I were to go and shoot my nets, and these smacks were to come in, they would take every one of them up in a very short time.

6174. I think none of the previous witnesses said anything about the smacks injuring the herring-fishing?—No.

6175. Do you go to the herring-fishing now?—No, I do not go much. I have been a week or two this

FILEY.

W. Jenkinson.

1 Oct. 1863.

last year, that is all. But I know one thing, the smacks have done a very great deal of damage and a very great deal of hurt.

6176. Do you know the difference in the price of the fish as compared with what it was 20 years ago?—We get a better price for the fish than we did 20 years ago.

6177. Are the fishermen as well off now as they were then?—I do not think they are.

6178. In what way are they less comfortable?—They can get a better price for the fish, but there is less fish to catch. If they could catch more fish, even at a less price, they would get more money than they do now.

6179. Do you think they are not so well off now with a smaller quantity of fish than they used to be when they had a larger catch and a smaller price?—I think not. I have been a fisherman upwards of 70 years, and I do not think the fishermen are as well off as they used to be.

6180. What was the size of the boats at the time you refer to compared with what they are now?—They are a great deal better now than they were then.

6181. At that time were there any large decked yawls?—Yes, they had just begun to get decked boats when I first went.

6182. Are they about the same description of boat that they were 70 years ago?—They are better now, and of more tonnage.

6183. Have you found any difficulty in coming in here in stormy weather with the large boats?—I have at times.

6184. What have you done in such cases?—When I have come here and found I could not get in, I have been obliged to go to the Humber before I could get any shelter.

6185. You have been obliged to make for the Humber?—Yes, Scarborough we dare not try.

6186. Would it be of advantage to you if you had some shelter you could run to in heavy weather?—Yes.

6187. Do you think that would have a tendency to increase the number of fishing boats?—Yes, and the boats down south also might come in then; the Scotch boats and all the smacks could come. They could come here when they could not go to Scarborough. They can come here now when they cannot get into Scarborough.

6188. (*Professor Huxley*). How long is it since you saw the trawlers interfering with the drift-nets?—I do not exactly understand you.

6189. You spoke of the trawlers coming among the drift-nets, how long is that ago?—That would be 20 years since.

The witness withdrew.

E. Scales.

Edward Scales called and examined.

6190. (*Mr. Caird.*) Have you long been a fisherman here?—It is 20 or 30 years since I first began.

6191. Do you practise all the kinds of fishing practised on this coast?—Yes, cod-fishing and line-fishing.

6192. Long-line fishing of all kinds?—Yes, and soleing and herring-fishing.

6193. Do you find in your experience that the quantity of fish you can bring ashore now has fallen off as compared with what it was 20 years ago?—Yes, it has fallen off three parts.

6194. You can only bring in one part out of four ashore now as compared with what you used to bring?—No.

6195. Has the quality and size of the fish diminished as well as the quantity?—I see no difference in that.

6196. Has any particular kind fallen off more than another?—Yes, all kinds have fallen off—the haddock, the cod, ling, halibut, and all kinds.

6197. What do you think is the cause of that?—Nothing but the trawling.

6198. When did you particularly begin to notice the falling off?—We found it out as soon as ever the trawlers began to come.

6199. Has it been diminishing gradually?—Yes, ever since they came.

6200. Have they been increasing in number?—Yes.

6201. Have they come in close to your shore?—Yes.

6202. Have they done that for some time?—Yes, there are 18 or 19 of them going up every day.

6203. Do they trawl on the ground in which you used to fish?—Yes, and upon ground that we fish upon now.

6204. Do you catch fish now?—Yes.

6205. Do you get plenty of fish?—No, about 6 or 7 stone. Some odd times we may get 20 stone where we used to get 70 or 80.

6206. How many years is it since the trawlers began to come here?—About 20 years, and since then they have increased more and more. They have been getting a nice catch of fish, and they have kept increasing the number until they have cleared the ground very nearly.

6207. Do they still get a nice catch of fish?—I should say they can hardly make a living out of it now.

6208. Have you ever seen them bring up the trawl?—No.

6209. Then you cannot speak as to whether the fish are damaged by the trawl or not?—No, but I have seen some that had been taken to Scarborough that had been all torn to pieces, and had had all the scales pulled off.

6210. How long is that since?—Only last week.

6211. Had the trawler been at sea some time?—No.

6212. Had it just come in?—Yes, it went off at night and brought the fish in in the morning.

6213. Was a great proportion of the fish damaged?—Yes, there were more damaged fish than good fish.

6214. Out of the one boat?—Yes.

6215. Did you see every kind of fish that came out of the trawl-boat?—I saw the soles, I believe there were no bratt.

6216. Did you see all of them?—Not all. I saw what they brought to sell.

6217. Did you see all they had on board the boat at that time?—I saw all that came on the pier to be sold.

6218. How many baskets were there that were not good?—About two baskets.

6219. What was done with them?—They were sold for what they would fetch.

6220. They were not thrown overboard then?—No, I cannot say how much was thrown overboard.

6221. But you do not know that as a fact?—No, but the fishermen would tell us that they had thrown some overboard.

6222. With regard to the herring-fishing has there been as much decline as some of the witnesses have mentioned, or has the herring fishery been as good as formerly?—No, not half.

6223. Are there more boats than there used to be?—Yes.

6224. And do they not bring as many fish ashore as the boats did when they were fewer in number?—No, I think if they got the same that they got formerly they would lose all their nets by them.

6225. Why?—Because there was that quantity of fish on the ground formerly.

6226–7. What is the cause of the diminished quantity?—I cannot tell unless it be the trawlers.

6228. Does anybody interfere with you at all in regulating your mode of fishing?—No.

6229. Would you like to have somebody to come and tell you when you ought to fish, and when you should shoot your nets?—No.

6230. You think it better to take your own will upon that matter?—Yes.

FILEY.

E. Scales.

1 Oct. 1863.

6231. (*Professor Huxley.*) What is the price of herring now, compared with what it was 25 years ago?—We sold the herring better then than now. I have been selling it for manure.

6232. Did you get a better price for it in that way?—No, but there was such a quantity caught.

6233. How long is that ago?—Twenty years; there were no curing houses then.

6234. Are there curing houses here now?—Yes.

6235. Is there a large quantity of herring cured?—Yes.

6236. Do you get as much money by your herring-fishing now as you did 20 years ago?—No, I think not.

6237. Do you catch less white fish also?—Yes.

6238. And do you get less money for it on the whole?—For soles better, but we do not get that quantity of fish.

6239. On the whole you do not get so much money?—No.

6240. Then the catch of herring has not made up to you for the loss of the white fish?—No, nothing of the sort.

6241. Were the soles that came out of the trawl much damaged?—I did not take much notice of them, they looked good, all the soles that came out of the trawl.

6242. You spoke just now of damaged fish?—I meant the whiting and little haddocks; those are the things they destroy, they are a tender fish, and they go bad in the net.

6243. The soles were pretty good?—Yes, they are a hard fish.

6244. When you spoke of damaged fish did you mean that they were bruised, or that they were small fish?—I meant they were bruised; there were good sized haddocks all mashed, and there were whiting that would have fetched a good price if they had come up with a hook, bruised and all mashed.

6245. Are you a herring fisher?—Yes.

6246. Do you ever get herring in January and February?—In February, no, it is too late; we give over then.

6247. What are your fishing months here for herring?—We start in the back part of July, and we laid up last week.

6248. Then do you go on till October?—Yes, the big boats do.

6249. Did you ever see an appearance of herring here in February?—No.

6250. You never did see any?—No.

6251. You heard me ask some questions just now about a law relating to lights and regulations of that kind, did you ever hear of them?—Yes, I have heard of them, but they were never set up.

6252. Do you know of the existence of any law about the size of your herring meshes?—No.

6253. Did you ever hear of any regulation about decked and undecked boats?—I cannot say that I ever did.

6254. Do the French interfere with you much?—There have been a few on the coast here; there have been less this year than for a vast of years.

6255. Has that been the case during the last few years?—There were a good few last year, but very few before that.

6256. Do you agree with the last witness that when they come among you they do you much damage?—If you take your nets down they will shoot over you, and take no more notice of you than if you were not there, and therefore you must get out of the way.

6257. Your decked boats are pretty big boats, are they not?—Yes.

6258. Are the French boats bigger than yours?—They are nearly as big again.

6259. Therefore you cannot hold your own with them at all?—No.

6260. Then if the Frenchman shoots over you and damages your nets, cannot you complain?—Yes, if it was of any use.

6261. Why is it of no use?—You cannot make anything of them.

6262. They are numbered, are they not?—Yes, but the gunboat takes no notice of them; she is in the harbour instead of being out here.

6263. But if you complained to the commander would it not do some good?—Yes, he has gone sometimes and brought them in, but he is always in the harbour now, so he is keeping a good look out; he has been in Scarborough now for a fortnight or three weeks.

6264. If the gunboat was wide awake and looked well after them, would he afford adequate protection?—I think so, but we never know when he is there.

6265. Would you be content if the French were kept outside of the three-mile limit?—Yes.

6266. Are most of the fish caught within the three-mile limit?—No, most of them are caught five, six, seven, and eight miles from the shore.

6267. Then what would be the good of keeping them outside the three-mile limit if most of the fish are caught seven or eight miles from the shore?—They should not come where the thick of the boats are when there is a shoal of fish; they all cleave to it as thick as may be; one will see a great quantity of herring and then all the rest will bring up there; they will bring up as nigh as they dare to them.

6268. You know it is the law that a foreign vessel shall not shoot her nets within three miles of the English coast?—Yes, but there is nobody there to hinder them.

6269. Suppose the gunboat were there to carry out the law, would that be of any use?—Yes, if they kept the Frenchmen to their limits it would do good, but the gunboat never comes nigh hand to them.

6270. But if the fish were seven miles off, then the Frenchmen would be entitled to fish; if he could only be kept three miles off he would be as nigh the fish as ever?—Yes.

6271. Then there would be no great good in enforcing that regulation?—No.

6272. When fishing, have you been interfered with by the trawlers?—Yes.

6273. Have they come trawling across your drift-nets?—Yes.

6274. Are you aware that that is contrary to the law?—Yes; they did till we found them out.

6275. Have they no numbers?—Yes; but it is generally dark. Four years since they came right down over our nets, and took all the buoys from them, and destroyed them altogether.

6276. Could you not fine them?—No; although we caught the boat we were so busy that we could not stop her till she got too far off.

6277. Then you in your small boat were unable to catch her?—Yes; we did not think of taking the trawler's number until it was loo late. If we had had the number we should have made him pay the damage, but we did not succeed in getting it.

6278. Do you think that any kind of police regulation would be of any good? Suppose the gunboat was among you could she not keep the trawlers from going across your nets?—Yes; I think so.

6279. Or if a man-of-war's boat rowed guard all night would that be of service to you?—Yes; they all lie as nigh as they dare among one another. The trawlers should keep at the outside. When there is one among them although you see a shoal of fish you dare not lie among them.

6280. But the law says a trawl-boat shall always keep at a distance of three miles from the herring boats. Did you ever hear of this? "Trawl-boats "shall always keep at a distance of at least three "miles from all boats fishing for herring or mackerel "with drift-nets"?—Yes.

6281. Do you think if that were enforced you would have sufficient protection against the trawl-boats doing you any damage?—Yes.

6282. If the trawlers were obliged always to keep three miles from you they would do you no injury?—No.

6283. Have you ever been herring fishing in decked or undecked boats?—Yes, in decked boats, and in undecked boats also.

FILEY.

E. Scales.

1 Oct. 1883.

6284. When you were in an undecked boat have you shot your nets near where the decked boats were fishing?—Yes.

6285. Did you know that that was against the law?—No.

6286. Did you ever hear of this law—"Whenever "decked boats and undecked boats shall commence "shooting their nets at the same time the undecked "boats shall shoot their nets to windward of the "decked boats, except they should prefer going "leeward to a distance of at least half a mile to shoot "their nets." Have you never heard of that law?—No; we never heard of it.

6287. But that is the law?—It is a very bad law then. That law won't do.

6288. Why do you think it is a bad law?—Why, if you see any herring near you, you are not going to stand outside of them.

6289. Do you prefer the chance of taking the fish and running the risk of being fouled?—We haul in when we have any fish in the nets, and when we can get none we go and look for them. If we rouse a shoal of herring in the water, then of course we will have our nets among them if we can.

6290. That is always the case?—Yes; it is of no use going to land without herring.

6291. But there is a law relating to decked boats as well. The Act of Parliament says, "The decked "boats on their part shall shoot their nets to leeward "of the undecked boats unless they prefer going to "windward to a distance of at least half a mile to "shoot their nets;" so that you see the law keeps the decked boats away from the undecked boats, as well as undecked boats away from decked boats?—Yes; it keeps them all at a distance.

6292. What do you think of that provision of the law?—I do not think it will do at all. It cannot be better than it is now.

6293. This law was made to prevent the chance of decked boats fouling undecked boats?—Yes.

6294. Would you rather take your chance of being fouled, in order that you may get what fish you can?—Yes.

6295. Do you think the trawlers do you a great deal of harm?—Yes; a great deal.

6296–7. What would you like to have done with the trawlers; would you like to have them condemned?—Yes; the whole lot of them.

6298. Would you not let them fish anywhere?—No; only with a hook-and-line.

6299. At one place a long-line fisherman told us he would keep them 12 miles outside the Dogger Bank, would that suit you?—Yes. We do not often go there. We could not get our fish in from there; it is over far.

6300. Do you think the long-line fishing and trawling could go on on the same ground together?—No.

6301. Why do you think they could not?—Because I have experienced it. I have some long-lines going yet, for aught I know, at the stern of a trawler.

6302. Why do you think that the two processes cannot go on together on the same ground?—They are so much stronger than we are and when they get hold of our tackle they take it all away together.

6303. Have you ever lost tackle of that kind in consequence of its being carried away by the trawlers?—Yes.

6304. How long ago?—Four years.

6305. Is that the only occasion on which you have lost long-lines?—Yes, that is the only case.

6306. Were they all carried away together?—Yes.

6307. Where they destroyed?—I never saw any more of them.

6308. Is it possible for the trawlers to work over the long-lines without carrying them away?—They might do so an odd time, but I am sadly afraid when they go over mine that they will take them away altogether. It is not often that they go over them without injuring them.

6309. Is there any other reason why you would put the trawlers down?—Yes, because they destroy all the fish. When I go out fishing now I can hardly get anything.

6310. You do not mean to say that they destroy all the fish, because I believe they go on getting fish themselves?—They can hardly manage to make a living of it.

6311. In your experience of them has the number of trawlers increased?—I believe it has, but I think they are at the far end now. There is a good lot of them to sell.

The witness withdrew.

W. Cammish.

WILLIAM CAMMISH called and examined.

6312. (*Mr. Caird.*) Have you long been a fisherman here?—Yes, ever since I went to sea when I was 11 years old.

6313. Are you still practising the fishing?—No. I gave it up about 14 or 15 years ago.

6314. Is it the case that although the number of boats has increased in the herring fishery, some of them may not be making much by it?—The seasons alter. Sometimes there is a good supply of herrings and at other times they are very scarce.

6315. Can you give us any reason why the number of boats should have increased at the herring-fishing if the fishing itself has fallen off?—No.

6316. Is it not the fact that the number of boats has increased?—Yes, there used to be only 11 or 13.

6317. And how many are there now?—26 or 27.

6318. Do some of them make a more fortunate fishing than others?—Yes a great deal.

6319. Some are very fortunate while others may be very unfortunate?—Yes.

6320. Is it the case that in one season you may have some boats making a very good trade of it while a greater number are making a very bad trade?—Yes; that is so this season. The herring-fishing is quite a lottery business. The herring run in shoals and some may be more fortunate than others in coming across the shoals.

6321. Are there men who are more fortunate than others every year?—No, they are not always so.

6322. So the fortunes are pretty equally balanced taking an average number of years?—There are some who are fortunate for some years and then their good luck falls off and there are some who have been unfortunate one season who have been more fortunate in other seasons.

6323. Is it by the good fortune of some that the boats have increased?—They have increased by different people taking shares in them. There are many who do not go to sea themselves who have an interest in some of the boats.

6324. But surely they would not put their money in these boats if they did not find it answer?—Some do put their money in and they do not find it answer.

6325. But I presume they expect it to answer when they invest their capital?—You are right there, nobody speculates in a business without looking for something in return.

6326. Have you ever seen the trawl-boats hauling up their trawls?—No; I never was aboard of one.

6327. Do you agree with the previous witnesses as to the falling off in the produce of the line-fishing?—Yes, I have been at that business and I have got an abundance of fish. I have got large quantities with nothing for bait but mussels between Flamborough Head and Dimlington.

6328. Has the take fallen off considerably from what it used to be?—Yes, I can see from what the men bring in now that it has fallen off.

6329. Do as many boats go to the fishing now as did in your time?—They do not go upon the same

FILEY.

W. Cammish.

1 Oct. 1863.

ground I used to go upon at all. They could get nothing there, not between Flamborough Head and Dimlington.

6330. Do the trawl-smacks go there?—Yes, I think so.

6331. Do they get good takes?—I do not think they do, but I do not know. Our fishermen never go there.

6332. Is there any ballast thrown into this bay at all?—No.

6333. Is there any refuse of any kind thrown into the bay that could damage the fishing?—No, the boats all lie in that Brigg there.

6334. (*Professor Huxley.*) Have you known this place for many years?—Yes.

6335. For how many years?—For more than 60.

6336. Then you know pretty well the ins and outs of it, who owns the boats and who does not?—Yes, I know some of them.

6337. Do you think that the number of fishermen owning boats or having part shares in boats has increased during the last 30 years since you have known the place?—Yes.

6338. Has it largely increased?—Four or five years ago the herring fishery was good; there were large catches and the prices were good, and that made men speculate in that business, but during the last four or five years it has fallen off very much.

6339. How many years is it since the price of herrings was very good?—It would be about five or six years back.

6340. How many boats were here about 10 years ago, I mean the large boats?—I can hardly tell; there were perhaps 12 or 14, but I never kept any account.

6341. 12 or 14?—There used to be that number for several years.

6342. How many boats had you five or six years ago when you had this great take in the herring-fishing?—Perhaps 17 or 18, but I do not know rightly.

6343. 17 or 18?—Yes.

6344. Then there have not been more than five or six added in consequence of this lucky stroke in the herring-fishing?—No.

6345. How many have been added? You said the number of boats had increased in consequence of the people obtaining large profits from herrings, how many have been added, have there been more than three or four?—Perhaps four or five, or may be six.

6346. Do you think there was such a large sum of money taken at that time in the herring-fishing that persons could afford to invest 5,000*l.* or 6,000*l.* suddenly in herring-fishing boats?—It was not one person that would do that.

6347. Was the take enough to enable them to do it?—I cannot tell.

6348–50. It must have been a tremendous take to enable you to clear 5,000*l.* or 6,000*l.* all at once?—They never did it.

6351. You heard the evidence given a short time ago as to the fishing boats being for the most part paid for; there are no great mortgages upon them, are there?—I cannot tell that.

6352. Have you any notion how the fishing population as a general rule stand here; are they doing well or are they in difficulties?—That I cannot tell.

6353. Have you no general notion, have you no idea at all?—It is not my business to interfere with regard to other people's circumstances.

6354. I am not speaking of any individual, but with regard to the whole town. A man generally knows whether the town is prosperous or not?—It has not been so prosperous this last year or two.

6355. If there was any distress, I presume the fishermen would be in debt to the shopkeepers; I am not seeking to inquire into any particular person's affairs, but I want you to speak generally?—All I can say is that the herrings have been indifferent for the last few weeks.

6356. You do not think as a general rule that the fishing for herring has made up for the poorness of the fishing for white fish?—No, nor anything else. At the white-fishing they used to earn a good deal of money. They went away at the latter part of February, and fished from Lent up. During the whole of March they would fish, and they used to earn a good deal of money, more than they can earn now if they were to go five or six months to the herring fishery.

The witness withdrew.

R. Pickering.

Richard Pickering called and examined.

6357. (*Mr. Caird.*) Have you been at sea in a trawl-boat?—Yes.

6358. Have you been more than once?—Yes, several times.

6359. Off what coast?—Off Flamborough Head and off the Silver Pits.

6360. Have you frequently observed the trawl net brought to the surface?—Yes.

6361. What proportion of the fish brought up on the average was marketable, and what proportion was not marketable?—By far the greater part of it was marketable. I have seen as many as five tons hauled up at one haul, and there would not be more than two or three basketfuls thrown away.

6362. Were the two or three basketfuls so small that they were thrown overboard?—That is not exactly the reason. Among the fishing apprentices it is a perquisite to take what they call the dabs, the small whiting, the rays, the gurnets, the crabs, shell-fish of every description, whelks, and other things. The smacks stay out for two or three weeks, and occasionally five or six weeks, and they do not keep this fish for the boys, except the last two hauls or so before they proceed home, and that is the reason the small fish is thrown overboard, but for the last two hauls before they are going home there is nothing thrown overboard.

6363. When they keep for days together at sea have they any means of sending the fish they catch to market?—Yes.

6364. But they do not think that this small fish would pay the carriage?—No.

6365. What would be the average amount of small fish of that kind thrown overboard?—When I was on board they packed the fish in baskets, and out of 20 baskets there might be two or three of small fish.

6366. You observed the condition in which the marketable fish were?—Yes, so far as I saw it, it was always in a good condition, except it had been kept for some time on board the vessel.

6367. Was it mangled or much damaged?—I never saw it even cut through the skin.

6368. Did the fish come on board alive?—Yes, the whole of them.

6369. Does that apply to the small fish too?—All of them are alive when they are first drawn up but they soon die.

6370. Have you seen any spawn hauled up in the trawl?—Never.

6371. Have you ever seen spawn lying on the deck?—I have noticed it after they have gutted the haddocks. Haddock devours spawn of every description.

6372. How many times have you had occasion to see the trawl net drawn up?—I have seen it drawn up several hundreds of times.

6373. In different seasons?—Generally from February to October.

6374. Has that been in different years;—Yes.

6375. How many years is it since you saw it?—It will be four years since and perhaps four or five years preceding that since I saw it before.

6376. Do you know whether the trawl-fishers make a good business of it?—Yes, they do very well. The owners seem to do very well. I am acquainted with several of them.

The witness withdrew.

FILEY.

G. Douglas.

1 Oct. 1863.

GORDON DOUGLAS called and examined.

6377. (*Mr. Caird.*) Mr. Douglas, have you had much opportunity of observing the state of the fishermen and the trade in this place?—Yes.

6378. Have you been here for some time?—I have been here very nearly four years.

6379. Have you yourself gone to sea with the fishermen?—Not here, but I have in other places.

6380. Then such experience as you have has been derived from what you have seen on the shore?—Yes.

6381. During the four years you have been here, have you observed whether the take of fish has increased, decreased, or remained stationary?—I cannot speak positively as to that. I have heard great complaints on the subject, and I know that there has been very little fish got of late years compared with other places with which I am acquainted, where the trawlers do not exist.

6382. Can you say whether, in the course of those four years, you have observed the take of fish diminishing?—I can say nothing, except from hearsay.

6383. Have you ever observed the trawl-boats at work?—I have seen the fish landed at Scarborough.

6384. Are they in good condition when they are landed?—No, they are in a very bad condition. They are much mashed and bruised.

6385. Is that constantly the case?—Yes, with regard to all the trawled fish I have ever seen.

6386. Have you seen much fish landed at Scarborough?—Yes, I have seen several smackloads landed.

6387. Have you seen it coming in day by day?—Yes, day by day. I am very often at Scarborough, and I generally go down to the pier.

6388. Is all the fish damaged in that way?—Yes, I have never seen any that has not been.

6389. Are the fish put ashore there?—Yes, and they are all bruised and mashed.

6390. Have you often seen it sold?—I have seen it before it was sold, but I have never been at the actual sale of it.

6391. Have you ever seen good fish brought ashore?—No, not good looking fish nor large fish.

6392. Was it in great quantities?—Yes, there have been a good many smacks here.

6393. Would one smack have the average fishing of a line-boat?—In the present day I think it would, because the fish has been very poor on this coast lately.

6394. Have you seen a line-fishing boat come alongside with a smack?—No, but I have compared them.

6395. Would there be more in a smack than in a line-boat?—Some days there would and in others there would not.

6396. (*Professor Huxley.*) When you spoke of damage to the fish, Mr. Douglas, to what extent do you mean that it was damaged; do you mean that the look of the fish was not so good, or that it was absolutely torn?—I do not think the fish looked anything near so good, and I do not think it would be so good to eat. I think the driving of the fish in the trawl breaks the gall bladder.

6397. Did you ever eat trawled fish?—No, with the exception of soles.

6398. Did you find any difference in the soles?—Not so much in the soles, they are flat-fish; but with regard to others I think the trawling breaks the gall.

6399. Have you ever examined the fish to ascertain whether the gall bladder was burst or not?—I have never examined them personally, but I have known persons who have done so. I have never been on board and seen them haul their nets in the trawlers.

6400. You do not know of your own knowledge that the gall bladder has burst?—No, I know nothing, excepting what I have heard the people say who have examined them and found the gall bladder burst.

6401. Do you find that the trawl-fish are invariably scaled or have they their scales on?—It has a generally rubbed, or bruised, or scratched appearance.

6402. Have you taken the trouble to scrape one and ascertain whether the scales were on or not?—Generally they are so much scraped that they would hardly bear any more scraping.

6403. I tried it the other day, and I did not find it difficult. Have you ever tried it?—No.

6404. Have you ever seen the scales broken off a fish caught in the trawl?—Yes, I have seen the scales of haddocks broken off.

6405. Is it so common, do you think, that it spoils the fish *en masse*?—I should say so.

6406. Have you seen it as a matter of fact. Have you seen a large proportion of the fish with their scales broken?—I will not say a large proportion, but as a general rule they look bruised as if they had been walked on and well trampled. I have seen them trample on the fish on board as if it was so much dirt.

6407. There is a great difference between fish looking bruised and having its skin broken. I want to get at the fact whether the skin is broken or not. There is the same difference as between a man's face being bruised and his face cut. Have you observed the skin being broken, or at all destroyed?—I have seen it broken.

6408. Is that a general rule among the trawled fish?—I will not say that it is a general rule.

6409. Have you found there is any difference in the length of time the trawled fish will keep as compared with other fish?—I cannot say from my own experience, but from the look of the fish I should not say it would keep very long. I see all the boats of the line-fishers coming in here in the winter time.

6410. You said that you had occasionally eaten soles that had been caught by the trawl?—Yes.

6411. Did you ever find that they did you any harm?—No.

6412. In examining the fish market, have you ever noticed any difference in the price given by the dealer for trawled fish as compared with hooked fish?—I have never taken such particular notice. I can only speak of what I have seen at Scarborough.

The witness withdrew.

(*Mr. Caird.*) Is there anyone in the room who desires to add anything to the evidence which has been given?

There was no response; and the inquiry was then adjourned until Friday, October 2, at Flamborough.

Flamborough, Yorkshire, Friday, 2nd October 1863.

PRESENT:

JAMES CAIRD, Esq., M.P. (Chairman). | Professor HUXLEY, F.R.S.

FLAMBOROUGH.

T. Fell.

2 Oct. 1863.

TANTON FELL called and examined.

6413. (*Mr. Caird.*) Are you a fisherman at Flamborough?—At present I am.

6414. Have you been for some years a fisherman there?—All my life I have been at fish buying, fish catching, or fish curing.

6415. Have you been engaged in all those businesses?—Yes.

6416. Are you engaged in them at present?—At the present time I am engaged in fishing.

6417. What different kinds of fish are caught off

this coast?—Cod, hake, skate, ling, herring, plaice, conger eels, and various other kinds of fish.

6418. How many years back does your experience extend?—40 years.

6419. Has there been any increase in the number of fishing boats here within the last 10 or 20 years?—Yes, there has been a considerable increase in the number of fishing boats.

6420. Can you tell us what the number was about 20 years ago?—I cannot give you the exact number. There may be 9 or 10 boats more now.

6421. There are 9 or 10 boats more now than there were 20 years ago?—Yes.

6422. Are the boats larger now or smaller than they were formerly?—There are more large boats now than formerly, but they still carry the same number of men.

6423. But is there a larger number of hands on board now than there used to be?—I think they will have rather more hands now than they used to have. The herring boats carry far more.

6424. How many boats are there here which are engaged in the herring fishery?—I think there are somewhere about 30.

6425. How many are there engaged in the long-line fishery?—There are about 42 in-shore boats.

6426. Have you different boats for the herring-fishing, and for the long-line fishing?—Yes.

6427. I want to know what number are engaged in the long-line fishing?—I think there will be about 42; but there is a difference; in some years there were 43 or 44. In some years there are sometimes more and sometimes less.

6428. Have you noticed in the course of your experience any change in the quantity of fish that can be brought on shore in a single catch by one boat on the average?—Yes, as things were in times back,—I mean a number of years back,—they would average a great weight of fish in a take. Now the fishing is quite different. In point of fact it has been turned upside down.

6429. You are now speaking of the long-line fishing?—Yes.

6430. What would be a fair day's fishing 20 years ago?—A boat would get 58 or 60 stone of cod, haddock, and other fish. They would average that each boat.

6431. And what will the average be now each boat?—Sometimes 12 or 15 stone. A catch will be something in that way. We have very few caught now at all. Sometimes a boat will go out and only get 2 or 3 stone.

6432. Then there has been a falling off in the take of fish?—Yes, an immense falling off.

6433. Has the falling off been in any particular kind of fish?—It has been in cod in general.

6434. Are the fish as large and as fine as they used to be?—No, there are very few fine fish caught now as compared with what were caught formerly.

6435. Have the haddocks diminished in quantity?—Greatly.

6436. Have they diminished as much in quantity as the codfish and the other fish caught here?—The cod and the haddock are much the same. They are a light sort of fish, and they are generally caught here young; the codfish are also very small, weighing 3 lbs., or 4 lbs., or 5 lbs.; they are a very small-sized fish.

6437. Were you not in the habit of catching fish of that size 20 years ago?—Yes, plenty, and much larger too. We used to get plenty of cod and haddock too.

6438. Do you get any turbot here now?—No, not here.

6439. Was not this at any time a fishing place for turbot?—No, very little.

6440. Have you much fishing for soles?—No, the trawlers have done away with that.

6441. Have you any trawl-boats here?—No.

6442. Neither large trawlers nor small ones?—No.

6443. What do you think is the cause of the falling off in your fishing?—According to my idea the principal cause is this: We used three or four of us to cure fish from 1835 up to 1844. At that time there were very few trawlers; I do not suppose that there were more than seven or eight, and we could send our boats out to Dimlington, and they would bring us in 2,000 head in a day or two's catch. That is far more than is caught now. Well, the trawlers kept increasing, and as they increased so the fishery kept diminishing, and we thought that the falling off was caused by the trawling. Whether it was or not, it is not for me to say. We say that that was the cause. At last they came down right across and athwart the Edge, and the fishing gradually diminished until now we can scarcely get a cod in a day.

6444. Have you observed in particular fishing grounds whether the quantity of fish caught have gradually diminished. Have there been particular grounds on which that diminution has been more marked than on others?—Upon all the grounds off here the fish have gradually diminished, particularly codfish and haddocks.

6445. Do the trawl-boats come on the same ground you fish over with your long-lines?—Yes, they come over some parts of it, and we dare not attempt to fish where they are. They carry us away just like a whirlpool.

6446. Are there some parts of your fishing grounds upon which you have not been interfered with by them at all?—Yes, there are many places where they cannot trawl on account of the rocks. That is where we get our fish now; I mean all that we do get.

6447. Have the fish fallen off there?—There are only a very few miles of ground upon which they cannot trawl.

6448. Upon those few miles do you find more fish than upon the ground where they do trawl?—Of course we do.

6449. Have you observed that yourself?—Yes, that is the principal spot upon which we catch our fish.

6450. Can you catch as many there as you could before the trawlers came here?—No, the large fish do not come in now; the fish run off to the soft ground in the spring time. The trawlers destroy the spawn, and I believe that that is the cause why the big fish do not come in. At any rate, we say so.

6451. Have you ever seen a trawl net drawn up to the surface?—No.

6452. Then you cannot speak of your own knowledge of any actual destruction caused by the trawl nets?—No, I cannot. I never was on board a trawler.

6453. Do you fish for shell-fish here?—We do for crabs and lobsters.

6454. Have they increased or diminished in quantity?—In some years we have a very good year; in other years they are not so good. We have plenty of small shell-fish, however.

6455. There has been no marked diminution in them?—No, very little. There are a good many more boats going now than used to be engaged in that trade.

6456. More boats go now?—Yes, a good many more.

6457. Are there a good many more crabs and lobsters brought in?—No, not so many as were brought in formerly. There used to be very few boats in the trade, and the quantity of shell-fish caught could not be consumed in those days.

6458. Are there not as many lobsters as there used to be?—No, not one quarter as many.

6459. Are there as many crabs?—There is a very fair supply of crabs.

6460. What is the reason the lobsters have fallen off?—I cannot say.

6461. Are they more closely fished than they used to be?—Yes, they are a great deal more closely fished.

6462. Do strangers come from a distance to fish on your lobster grounds?—No, I do not think that any strangers come to interfere with us.

6463. Is the herring fishery an important business here?—Yes.

6464. Do a boat's crew make as much money by the herring fishery as they do by the whole of the

FLAMBOROUGH.

T. Fell.

2 Oct. 1863.

long-line fishing?—It will depend very much on the season.

6465. Has the number of herring boats increased during the last 20 years?—Yes.

6466. Can you tell us what the increase has been?—No, I cannot tell you that.

6467. Do they carry larger nets—a larger fleet of nets?—Yes, they carry more nets than they used to carry formerly; a great deal more nets.

6468. Have you more than one season for fishing herring?—Yes; they are going to catch the in-shore fish now.

6469. What is the principal season for the herring-fishing here?—They start about the 14th of July, and they end about September, in general. They are a few days later this season than they generally are.

6470. Do they fish only at that time of the year for herrings?—Yes; a few of them work in Bridlington Bay, off here, for in-shore fish.

6471. Is that during the month of October?—Yes.

6472. Do you find the herring at all in the month of January?—No, not here.

6473. Are they here in any other month than those that you have named?—They are here in October, and in part of November.

6474. Do the French boats come here at all?—No.

6475. You are not disturbed by any strange boats coming among you?—Not in-shore; sometimes they come off the Head here when we are in the offing, but there have not been many down here this season.

6476. Have you had many French boats here at all?—No.

6477. Have they given you great trouble in any other season?—Yes, a great deal sometimes.

6478. Was that when there was particularly good fishing?—Yes.

6479. Did they follow your boats?—Yes, and they covered the ground, and we might then go and do as we liked, because we dare not fish among them.

6480. Did they come within the three-mile limit?—Yes, they did.

6481. Are you aware that there is a three-mile limit?—There are different opinions about that. Some say that it is taken from a fair sailing scale, and that it includes the bays; for instance, that it is to be three miles north and south from the headlands. Now Hartlepool is a long way in; the fish are never inside that bay, but at other places they come inside; at Scarborough, for instance, they can come in quite close. The three-mile limit would be very little good in some places unless it is taken from the headlands.

6482. Are the principal shoals of fish generally outside the three-mile limit?—They are, in some part of the ground.

6483. I am now speaking of your coast?—Yes, they are generally outside the three-mile limit here.

6484. In the course of the herring season here you get more fish outside the limit than inside?—Yes, I am convinced of that.

6485. Outside the limit?—Yes.

6486. Are there any gunboats that ever come down here to look after the fishing, and enforce any regulations?—We have had gunboats here in some years.

6487. Were there any gunboats here last year?—Yes, I believe there was one.

6488. Do they do any good to you in protecting you from the interference of the French fishermen?—They will go out sometimes, but they have such a long route to travel from Hartlepool here, that if the French boats drop their nets in here they may take them where they like, and it is 100 to 1 against the gunboats ever finding them.

6489. Have you any regulation as to the size of your meshes, or the time of shooting your nets?—No.

6490. Does any authority come down here to point out to you that there are certain rules that ought to be observed?—Yes; as to the meshes, there are rules.

6491. Has there been any officer here to measure the size of your mesh?—No, not lately.

6492. Then practically you do what you like yourself?—Generally. We want to catch the biggest fish, therefore we use wide meshes.

6493. But nobody interferes with you in any way?—No, not lately.

6494. Can you recollect any time when they did?—Yes, they did when we had the bounty for salting fish. A Mr. McClellan, a Scotchman, used to look after the nets then.

6495. Is that some years ago?—Yes, it is 20 years since he used to come here and stamp the fish.

6496. Is there any advantage in having a regulation in regard to the time at which you should shoot your nets?—I do not think that that would make much difference.

6497. Would you desire to have a regulation enforced by authority that every one of the fishermen should not shoot their nets till a certain time, or would you prefer, as at present, not to be interfered with?—It takes some of the large boats a longer time to shoot their nets than it will take the smaller ones; we use the smaller boats, and therefore do not think that such a regulation would be of much advantage to us.

6498. Are the shoals of fish likely to be broken in consequence of the nets being shot too early in the day?—No, I do not think they will come up until night.

6499. Do the French shoot their nets earlier than you do?—Yes, a great deal.

6500. Does that break the shoal of fish?—I cannot say.

6501. You are not aware that it has done any damage to the fishing?—No, I cannot say.

6502. You are a buyer of fish, I believe?—I have been a buyer of fish, but at present I am a fish catcher.

6503. Can you tell us anything about the markets to which the fish are sent from here?—Yes, I think I can.

6504. To what markets do you send your fish?—To Manchester, London, Liverpool, Leicester, Nottingham, Birmingham, Northampton, and various other places.

6505. How long is it since you began to send fish to these large markets?—Ever since the railway was opened. It used to have to go by carts, and then it was generally two days in going. We had to cart it night and day.

6506. Then I suppose that there has been a great advantage derived from the opening of the railways in getting your fish earlier to market?—Of course there has, but there has not been so much caught. There used to be an immense quantity caught before the trawling commenced.

6507. From your experience as a seller of fish are you enabled to state what was the price you used to get as compared with the price given now?—The price is higher now, and that is in consequence of there being such small catches of fish in comparison with what there was formerly.

6508. Is the price higher in Manchester now than it used to be a few years ago?—Yes, it is for good fish, because there is not the quantity caught that there was formerly.

6509. Do you speak of your own knowledge?—Yes; when I used to send it I could sell it for 2*s.* a stone at Manchester, now I cannot sell it for anything like that price. Then they were getting 60 or 80 stone, whereas now they are only getting 10 or 12.

6510. What price did you get at Manchester some years ago?—2*s.* a stone.

6511. What price do you get now?—Not much more than that when the carriage and everything is paid. We used to get 8*d.* or 1*s.* a stone when there was so much of it caught.

6512. That was clear of all expense?—Yes, it used to be sold at that price.

6513. Was it sold at Manchester for 8*d.* to 1*s.* a stone?—No, it was sold here for that, not at Manchester.

6514. What was it sold for at Manchester ?—2*s.* a stone.

6515. What is it sold for at Manchester now ?—From 3*s.* to 4*s.* a stone; but the price depends upon the quantity that comes in from other markets.

6516. I want to get at the average price now as compared with what it was some years ago ?—There is no average price for fish, it depends very much on the catch, but the catch does not amount to what it did formerly by a long way and the prices are therefore higher, but we could get more money formerly when we sold the fish at 8*d.* to 1*s.* a stone than we can now when we get 3*s.* and 4*s.*

6517. Do many mackerel come off here ?—A few come with the herrings, but we do not catch many.

6518. Do you not follow mackerel-catching ?—No, it is not followed here, there is very little of it.

6519. Are there not sufficient mackerel to make it worth your while ?—We are generally away herring catching at that time.

6520. (*Professor Huxley.*) When you were a long-line fisher did you ever have your lines carried away by the trawlers ?—I have not, but there are persons here who have.

6521. Was that a common thing ?—Yes. They dare not put their lines down; they are obliged to keep them up. If there is a strong wind they would be sure to be taken away. I never had any taken away myself.

6522. What is the size of your herring nets ?—About 31 or 32, I think.

6523. Thirty-two meshes to the yard ?—Yes.

6524. Why do you make them no smaller than that ?—We want to catch the biggest fish we can; we want to catch the large fish.

6525. Suppose you wanted to catch small fish, and wished to make your mesh 40 to the yard, is there any reason why you should not do so ?—I believe that 36 is the lowest we could go to. They are all manufactured by steam now, and I believe they do not make them that size.

6526. Are you aware of the existence of any law against having the meshes 40 to the yard?—The fish we should catch with a net composed of meshes of that size we could not sell; nets of that kind would be of no use to us.

6527. But do you know that such a net would be against the law ?—Yes, it would be against the law of the land.

6528. What is the legal size of the mesh ?—I think it is the size of a shilling. It must allow a shilling to pass through it.

6529. Has anybody ever examined your net ?—Oh, yes.

6530. Within how many years is it that that was done ?—Well, it would be 20 years since anybody looked at them.

6531. How is it that the French interfere with you; cannot you shoot your nets among them ?—Yes, but they will most likely get their nets shot before we start from the shore.

6532. You have no room when you get to the ground to shoot your nets ?—No.

6533. Is their tackle as heavy as yours ?—Yes, it is as heavy again.

6534. Then that causes them to interfere with you more than they would otherwise ?—They have far stronger vessels, and they think that they have as much right to fish there as we have.

6535. Are yours open boats ?—Yes.

6536. Undecked boats ?—Yes, and our nets are as light and fine as possible.

6537. Are the French boats all decked boats ?—Yes, and some of them are of large tonnage.

6538. Have you heard of the existence of any regulations with regard to decked and undecked boats ?—Yes, we have had the Fishery Act here; we had it a number of years back, but there has been some alteration made in it, I think.

6539. Is there anybody here to see that you carry out the Fishery Act or not ?—No.

6540. You do pretty much as you like ?—Yes.

6541. Do you carry lights in your boats ?—Yes.

6542. How are they arranged ?—We only carry a lantern.

6543. Is that fixed to the masthead ?—We cannot put it on our mast heads, because we take the masts partly down, but we put it on a pole.

6544. Have you only one lantern ?—Only one.

6545. Do you know whether there is any regulation on that subject ?—No, I never heard of any.

6546. Do you find that the trawled fish coming to market does you harm with the fish salesmen ?—Of course it does us harm.

6547. In what way ?—The dealers have indifferent sort of fish, which goes into the market when it is scarcely fit for food.

6548. But how can that do you harm ?—Of course, if it can be sold cheap, it does harm to the fresh good fish.

6549. Would the people rather have trawled fish than yours ?—Some people will buy it if it is cheaper.

6550. Have you had your fish driven out of the market by trawled fish ?—Ours is always sold, but it has sometimes brought a less price in consequence.

6551. Then the result has been that the trawled fish has brought yours down in the market ?—The small fish would bring the price down in the market when there was a great deal of it, like anything else, but we should not think anything about the trawled fish being sent into the market if the trawlers did not destroy the spawn.

6552. Then you would not object to being undersold in the market ?—No, let every man have a fair chance in the market.

6553. You were speaking just now of the trawled fish being damaged and not fit for food, how is that ?—It may have been aboard several days. I have seen plenty sent to market that was not fit to be sold for food; some of it has been called a nuisance and condemned, while other portions of it have been packed off.

6554. If your hooked fish were kept for several days, would it not become unfit for food ?—Yes, it would.

6555. Does trawled fish become bad sooner than yours ?—No, I think that ours would become bad the soonest.

6556. How is that ?—The fish we catch is a softer sort of fish.

6557. You catch a different kind of fish ?—Yes, we do not catch so many of the fluke kind as they do; if we caught the same sort of fish the quality of ours would be so much better that it would keep longer. The fish that is caught with a hook always turns tight and stiff, but that caught in a trawl net always becomes soft and black.

6558. (*Mr. Caird.*) Where do you get your bait here ?—It comes from Boston Deeps.

6559. Have you no bait on your own shore?—There are a few mussels in the bay, but the trawlers tear them all away.

6560. Are they at present doing injury to the mussel beds you formerly used to get your mussels from for bait ?—We used to get them out of the bay; not all of the mussels we used, but part of them. I have known boats going to fetch them. There are plenty in the bay, but the trawlers tear them up with the trawls going over the beds when they are fishing for plaice.

6561. Do the trawlers trawl over ground upon which you used to get bait ?—Yes, there are mussel beds in several parts where they trawl.

6562. Were you ever in the habit of getting bait from those mussel beds ?—I never did personally, but I have known people who did.

6563. How did they get them ?—We dredged them up.

6564. Dredged them up ?—Yes.

6565. Then you were doing the same thing that the trawlers are doing now ?—Yes, just the same.

6566. I understand you to say that you do not depend for bait upon that supply ?—No, we used to get

FLAMBOROUGH.

T. Fell.

2 Oct. 1863.

them from Holland. They took them all out of the Boston Deeps, but ultimately they were stopped. Boats now come down here and sell them at so much a bushel, and lay them on the rocks.

6567. Do you take them up fresh from the rocks?—Yes, just as we want them.

6568. Have you any difficulty in regard to getting bait at present to enable you to follow your trade?—The men bring them from Boston Deeps here.

6569. What sort of ground is there in this bay?—It is chiefly rock and clay, and so on; the rocks extend so far and then there is sand.

6570. Is it upon the rocks that they trawl for plaice?—Yes it is, and the mussels grow upon the rocks; it is only the rocks that they dredge upon for mussels.

6571. You say that some of the trawl-boats come very close in-shore here, are they large or small trawlers?—They are only small trawl-boats.

6572. Are they cobles?—Yes.

6573. What do they trawl for?—Plaice.

6574. Do they trawl for soles?—No, only for plaice, there are no soles.

6575. Have they long been trawling there?—Yes.

6576. Where do they come from?—They belong to the coast here; they come from Bridlington Quay.

6577. Have you none here at Flamborough?—No, we go and fish in places where we have a chance, but when they come trawling among us they take our lines away.

6578. Have they trawled long over that ground?—Yes, for several years now.

6579. Do they get a good fishing now?—They shift about as the mussels grow; the mussels afford the feeding ground; you will not find the plaice except where the mussels are; they lie there.

6580. From your own knowledge of those boats which come to trawl for plaice on this feeding ground, do they get as good fishing now as they did when they first began?—No, nothing like it, there is nothing like the quantity got now that was got some years back.

6581. Not by the trawlers?—No.

6582. Are the number of boats employed for that purpose increasing or diminishing?—I am unable to answer that question; they all come from Bridlington Quay.

6583. Then you do not know really whether they make a good business of it or not?—All I know is that the quantity of plaice is not so large as it used to be; years ago there were a great deal more taken than they take now.

The witness withdrew.

R. Major.

RICHARD MAJOR called and examined.

6584. (*Mr. Caird.*) Have you long been a fisherman here?—I have been here ever since I was a boy.

6585. Are you engaged as a fisherman now?—Yes.

6586. Do you practise all the kinds of fishing that are practised on this shore?—Yes; for the most part we practise herring-fishing, crabbing, and cod-fishing.

6587. Which yields the largest return in the course of the year? Does the herring-fishing or the line-fishing bring you on the whole the largest sum of money for what you take in the course of the year?—Generally the herring-fishing when we have a good season.

6588. In the course of your experience have you noticed any change in the quantity of the fish brought to the shore in the line-fishing boats; has it increased or diminished?—It has diminished, what I know of it. I cannot give you a better explanation, however, than the previous witness has given you. He has had more experience.

6589. Do you agree with him entirely in the statement he has made?—Yes.

6590. What do you think is the cause of the diminution, and why has the quantity of fish brought ashore in the line-fishing boats fallen off?—My opinion is his opinion. I believe it is owing to the trawling, and it is the trawlers who are hurting the cod-fishing.

6591. Is it the cod-fishing more than any other that has been hurt?—I believe that the cod and haddock-fishing has been most injured.

6592. Have you yourself ever been on board a trawl-boat?—No, never.

6593. Does the herring-fishing vary year by year, or has it diminished on the whole regularly?—It varies I believe, and there are now many more boats engaged in it than there were formerly. I believe there are three times the number of boats engaged in catching herrings as compared with what used to be engaged formerly.

6594–5. There are three times the number on your shore?—Yes, where we fish.

6596. Is there an increased quantity of herrings brought to the shore now as compared with what used to be brought?—I should say there is, because there are so many more boats engaged, but there is not for each so great a quantity of fish.

6597. On the whole there is more brought on shore?—Yes, but each boat does not bring so many as was brought by a single boat years ago. Each boat now scarcely brings half as many.

6598. Have you been at all interfered with in your fishing by the French herring fishers?—Yes, at times.

6599. Do you agree with the previous witness that the French fishermen do not respect the three-mile limit, but that they come within it?—I have seen them within it.

6600. Do they go where the fish are the same as you do?—Yes, they go wherever they think they can find the most fish; wherever the most fish are there we find them.

6601. Would it be an advantage to you to have any regulation established or enforced by which you would all be obliged not to shoot your nets until half an hour past sunset?—No, I do not see how that would do any good; the herrings do not rise until a certain time of the night. If you were to shoot the nets at 2 o'clock in the afternoon you would not find the fish until it was time for them to rise at night.

6602. Then it would not be of any advantage if the men were prevented from shooting their nets before a certain time so that all of them should be able to shoot at the same time?—No, I do not think that that would do much good.

6603. You would rather, as a fisherman, be left to take your own course?—Yes; the only advantage that I can see with regard to the French would be to keep them further outside altogether.

6604. But speaking of yourself and your neighbours, you would rather take your own course and shoot your nets where you think they would answer best?—Yes; sometimes we fish in small boats, and the French are able to shoot where we dare not shoot. They shoot their nets where we dare not go in our boats at all. They use boats much larger than ours.

6605. Have you had any protection from the English gunboats against the French fishermen interfering with you?—No, the gunboats have been lying about Scarborough.

6606. Do they not come on your ground about the time of your fishing season?—They run up and down at odd times by chance.

6607. They do not give you any active assistance?—They do not seem to interfere very much.

6608. Do you think that they could give you any useful assistance?—They might keep the French vessels further off sometimes than they are.

6609. They could only keep them outside the three-mile limit; would that help you much?—It would be

a little help, but I do not think it would help us a great way; still it would be something; it might occasionally keep them outside of where we might prehaps be fishing. The fish are very near the land sometimes. I have myself seen them not two miles off on our coast, and I have seen them this year not three miles off. I have seen them on the ground in the bay within the three-mile limit. Last year they were there too. Indeed, I am confident they were within the limit, but they were only there one night.

6610. Do the French fishermen fish for herrings on Saturday and Sunday when you do not fish?—I cannot say. We do not fish on Saturday or Sunday nights, and we do not know what they do if we do not happen to be at sea ourselves.

6611. Have you never observed them fishing from the shore?—No.

6612. Then you have nothing to complain of with regard to their disturbing the shoal when you are not fishing on those days?—I never saw them, and I cannot say what they do.

6613. Do you think that their mode of fishing has a tendency to disturb the shoal. Do they do much harm in heaving the refuse over, does it attract the dog-fish or disturb the herrings?—We reckon that it does.

6614. Have you seen it yourself?—I cannot say that I have. I have seen them throwing the insides of the herrings over.

6615. Does that do harm to your fishing?—Yes, it will feed the dog-fish.

6616. Did you ever know it do you any harm?—No, but it is our opinion that it does; we think that it feeds the dog-fish.

6617. Do the trawl-boats come on any particular ground off your shore?—Do you mean the big boats?

6618. Yes, the big boats?—I have never seen any within two or three miles of our Head.

6619. Did they come upon ground that you were in the habit of fishing upon with your long-lines?—Yes, at times.

6620. What length will one of your long-lines extend to when you have it shot?—Perhaps a quarter of a mile.

6621. Not more than that?—Perhaps a little more; perhaps half a mile, some of them will reach half a mile; and perhaps more.

6622. Have you ever lost any lines in consequence of the trawlers passing over them?—I have not, but some of our people have. I have had my lines broken by trawl nets.

6623. (*Professor Huxley.*) Do you lose much fish on your long-lines by the "dogs" and suckers?—Yes, at certain seasons of the year.

6624. At what time of the year?—Generally from Martinmas to Christmas. When the frost and hard weather sets in we find the "dogs" go into deep water.

6625. How much fish have you occasionally had destroyed on the lines by the dog-fish?—I can scarcely tell; sometimes we get a great quantity eaten, and sometimes only very few.

6626. Are you much troubled by the suckers here?—The suckers?

6627. Yes; do they trouble you much?—I do not know what they are.

6628. Did you never hear of the suckers?—No.

6629. A sucker is like a worm?—I never saw one that I know of.

6630. But the dog-fish do you a great deal of harm?—Yes; we have a large number of "dogs" on our fishing ground at times.

The witness withdrew.

Moses Smith called and examined.

M. Smith.

6631. (*Mr. Caird.*) Are you a fisherman here?—Yes.

6632. Have you been a fisherman here long?—I commenced in the year 1816.

6633. Have you been a fisherman ever since?—Yes, ever since.

6634. Do you remember how many boats were here in 1816?—I believe there were about 90 or 100 men in our place at the time I first went to sea.

6635. How many are engaged in the fishing now?—I think there are 160 men now.

6636. When did the numbers increase so much; When did they begin materially to increase?—They have been increasing ever since I commenced fishing.

6637. Has it been an increase in the people themselves, or has there been an increase in consequence of strangers coming here?—The increase has been chiefly among the people themselves.

6638. Can you tell us the number of boats there were here then, and the number there are here now?—There would be something like 30 boats then, with three men and a boy in each of them.

6639. And now how many would there be?—There are 160 men employed now.

6640. And you have still three men in a boat?—Yes.

6641. Then that would be about 53 boats?—Yes.

6642. Are the boats larger now than they were then?—Those engaged in the herring-fishing are open-topped boats, and are larger, but the small boats we use for fishing in-shore are no larger.

6643. Have you no decked boats?—No, but I spent 10 years in a decked boat when I first commenced to go to sea.

6644. You have had a long experience as a fisherman here?—Yes.

6645. Can you tell us whether the quantity of fish you can bring ashore now in a fair average day's fishing is much less than it was?—Oh, yes; it has diminished above half by a long way.

6646. When did that diminution first show itself?—The first time we saw any difference would be about the year 1844; we saw no difference until then.

6647. Was that when it began first to fall off?—That was when it began to fall off—in 1844. It would be about that time.

6648. Has it continued falling off from that time?—It has continued falling off ever since, gradually.

6649. Did you five years ago find that you were catching as many fish as in 1844?—No, not one fifth part.

6650. And every succeeding year since those five years has the take of fish been getting less?—Yes, there has been a gradual falling off during the last 20 years.

6651. Was that about the time the trawl-boats began to come on your ground?—I think it would be about that time. I believe they commenced about 1840. I think a few boats traded to Hull in 1840. I have carried many thousand stones of halibut to Hull from 1836 up to 1844. The fish I am now telling you about are the off-ground fish.

6652. How far off the shore?—25 to 30 miles.

6653. Is that as far as the Dogger Bank?—Sometimes we went as far as the Dogger Bank; that is a little more than 30 miles off.

6654. Upon that ground where you got good fishing has the falling off been considerable?—Yes.

6655. Has there been any particular fishing grounds upon which you have noticed the decline more than upon others?—Yes.

6656. Where are they?—The ground away from here has been falling off.

6657. Has that ground been fished more than any other?—Yes, it has.

6658. Where has it fallen off least?—Where the rock is hardest, where they cannot trawl.

6659. Do you get the most fish there?—Yes.

6660. Was it the case formerly that you got the most fish on that hard ground?—Yes; we got most young fish there, but the big fish would lie on the edge of the soft ground.

FLAMBOROUGH.

M. Smith.

2 Oct. 1863.

6661. Do you not find the big fish on the soft ground now?—There are none at all.

6662. Do you not shoot your lines there?—No, we cannot. The trawlers have been little better than pirates on this coast.

6663. Have you ever lost any lines?—No; I have not been fishing there for the last 10 years.

6664. Then you cannot speak of it yourself?—No; I cannot speak to it exactly.

6665. Because you have not been there for the last 10 years?—Yes.

6666. Where have you been fishing for the last 10 years?—Along the shore.

6667. Has there been anything to interfere with you there?—Yes.

6668. What?—We cannot shoot our lines for the trawlers from Bridlington Bay.

6669. Where do you shoot them now?—On the off side. If we shoot our lines in Bridlington Bay we must take care of them, or they will tear them all away.

6670. Have you lost any lines?—No, but my brothers and companions have.

6671. How long is it since they began to fish inshore with these small trawl-boats?—Somewhere about 20 years. I cannot be positive as to a few years.

6672. Are they making a good business of it?—I am sure I do not know.

6673. You have had no opportunity of ascertaining?—No, I never was there, and probably I never shall go. We have always got our living with a hook-and-line, and by fishing herrings in the herring season.

6674. Do you not desire to follow any other mode of making a living?—No, ours is the most expensive way.

6675. Your way?—Yes.

6676. Then if theirs is a more profitable way and yields more fish, is it not a mistake seeing that you get fewer fish, to carry on your fishing at a greater expense?—We were brought up to nothing but hook-fishing and we cannot think of commencing anything else. We never did anything at this place but fish with a hook-and-line, and follow the herring-fishing and the mackerel-fishing a little.

6677. Do you follow mackerel-fishing here?—A little; we get them with a hook-and-line; after they have shot their spawn, if they will take the hook.

6678. Do you find that mackerel-fishing is a good paying business?—It is at times.

6679. Do you follow the crab and lobster-fishing?—Yes.

6680. Do you find that they are decreasing in number?—Yes, very much.

6681. In which kind is the greatest diminution?—There is a diminution in both sorts.

6682. What is the cause of that?—I think the cause is because they take the small ones.

6683. Do you take the small ones yourself?—Yes, what am I to do when other people take them.

6684. What do you do with them?—They go away and they are sold for anything or nothing.

6685. Do crabs of such a size as that sell in the market?—Yes, they will sell them half a dozen for a halfpenny when they go to the market. Good sized crabs are very greatly fallen off, but there are still large quantities of small ones, but in the course of a few years I think there will be nothing but small. We appeal to you to do something for us as we cannot do anything for ourselves.

6686. What would you like us to do?—We should like you to fix a proper size and have them well looked after.

6687. Do you mean a size below which lobsters and crabs should not be caught?—Yes.

6688. How do you catch them?—They are generally caught in pots, but we catch them in what we call a "trunk."

6689. What is a trunk like?—It is a piece of iron about 5 feet long, made round in a circle. We let it down with nets attached to it, and the little ones will get in.

6690. Is the net fixed upon the iron?—Yes, there is a net at the bottom.

6691. If the meshes were large enough would not the little ones get out?—No, they cling, and when we get them up they ought to be heaved away.

6692. You think the right thing to do would be for the Government to enforce a regulation that all below a certain size should be thrown into the sea?—Yes.

6693. Are they all brought up alive?—Yes.

6694. And would they live if thrown back into the sea?—Yes.

6695. Does that apply to lobsters as well as to crabs?—There are only a few small ones caught among the lobsters, but there is an odd one or two.

6696. What size would you take a crab?—I think the back should be 4 inches, the same size as they take them in Norfolk.

6697. Have they any regulation there?—Yes, 4 inches.

6998. Who made the regulation?—They agreed to it among themselves, I believe.

6699. They fix the size themselves and they throw all below that size back again?—Yes, that is what they do, I believe. They cannot bring any little ones in. If they bring in a little one they are fined 1*l.*

6700. How long is it since that change took place?—About 20 years.

6701. Have the crabs and lobsters increased since then?—Yes, abundantly.

6702. In consequence of that regulation?—Yes, they say so.

6703. And you think the same regulation ought to be imposed here?—Yes.

6704. Then why do you not do it?—We cannot get all into one mind.

6705. You think it would be a good thing if an Act of Parliament was passed to that effect that it should be enforced?—I should much desire it as an individual.

6706. In regard to the herring-fishing, is there any regulation you think it desirable to adopt in order to increase the catch of herrings?—There is only one thing that I know of in my experience, and that is that there are too many boats going out with small meshes, and they catch the herring when they are small. I do not know of anything else that you could do, except to put a stop to the small meshes.

6707. The law fixes the smallest size of the mesh at present; you think if the law were carried out it would be of advantage?—Yes, I am sure it would. When I was a boy I used to go to Yarmouth, and our nets were examined, and if the meshes were not right the nets were burnt.

6708. Would it be easy to enforce the law you refer to both with regard to crabs and herrings?—Yes, I believe it would.

6709. You would require to have an officer stationed here to see that the regulations were carried out?—Yes.

6710. Would one officer do?—We have two places where we come ashore, one on each side of the Head.

6711. Would the visit of an officer once a season be enough to see that the regulations were carried out?—Yes, I think so.

6712. Are the shoals of herrings off your shore increasing or diminishing?—They are diminishing.

6713. What is the cause of that?—I believe the cause is that they catch them before they get to a proper size.

6714. Are there many herrings caught here that are not of a proper size?—Yes, thousands and millions.

6715. Where?—All along the coast down to Whitby. We generally start in July, and I daresay our men have the proper nets. Our meshes are all 31 and 32 to the yard, but the Scotchmen come alongside of us, and their nets are 38, and some of them 40 meshes to the yard, so that while we are catching 200 or 300, they are catching 3,000 or 4,000.

6716. You find that the Scotchmen interfere with your fishing?—Yes, they carry too small a mesh.

6717. Is it the Scotchmen chiefly who have too small

a mesh to their nets?—I believe myself that the whole of the boats have nets with too small a mesh all round the island.

6718. All except yourselves?—I believe that at Filey, and Scarborough, and all along there, they have them all of one mesh. I think they all come from Musselburgh.

6719. What is the size of the mesh?—31 and 32 inches to the yard.

6720. You say the nets come from Musselburgh; that is in Scotland?—Yes.

6721. Do not the Scotchmen get their nets from Musselburgh too?—They come with much smaller nets than we have, and they gather thousands where we are only getting hundreds.

6722. Are you quite sure that they use a smaller net?—Yes.

6723. Do the French have a smaller net?—Yes, they do, and the West countrymen too.

6724. Do you think it would be an advantage if all were obliged to use a net with meshes 32 to the yard?—Yes, I would not allow a smaller mesh if I could help it.

6725. Do you think that the effect of enforcing such a regulation would be to increase the catch of herrings?—Yes, there are thousands and millions caught that are not half the proper size.

6726. (*Professor Huxley.*) Would it be advisable to regulate the time of shooting your nets?—It might in some cases, but the big boats want more time to shoot than the little ones. The French, however, will shoot much too soon if they are allowed to do so. I think if the herring nets were shot about an hour before sunset that would suit all persons, the big boats and the little boats as well. We do not want to shoot our nets before sunset, but the big boats want more time. I have known the French boats shoot their nets at 12 o'clock in the day, so that we could not get ours shot at all when we went out.

6727. Did that disturb the shoals of fish?—They got on the ground, and we could not get in.

6728. Then the injury was that they occupied the ground, not that they dispersed the shoal?—Yes, we could not get there.

6729. Do you think that the fish are disturbed by putting the nets into the sea in the daytime?—No, it is very rarely indeed that they rise before sunset.

6730. Then the object of restricting the shooting of the nets to a certain time before sunset would be to prevent strangers from coming upon the ground?—Yes, such as the Frenchmen. I have seen the French fishermen within a mile of Staithes and Hartlepool, within a mile of the shore, so that we could not get in at all with our small boats.

6731. In that case they would be within your limits and outside theirs?—Yes, but nobody goes there to protect us.

6732. Do any of your boats go upon the opposite coast, I mean the Dutch and French coasts, for fish?—No, we never leave home, except for about four months, when we go down to the North Sea. I have fished from Flamborough Head to Tynemouth.

6733. None of your boats cross to the other side of the Channel?—No.

6734. Do any Dutch boats come here?—Yes.

6735. Are they like the French boats in size and rig?—There are only a few of them.

6736. Is it chiefly the French boats of which you complain?—It is chiefly the French boats that bother us. We have very few Dutchmen here, not more than eight or nine sail, but we have about two or three hundred sail of French boats, and we have also the Hartlepool men and Staithes men, and others. The consequence of that is that we cannot get our nets in for them.

6737. You were speaking of the Bridlington trawlers, what kind of people are they?—They are a race of men brought up to the sea, who have served perhaps seven years to the sea, and then get on one of these boats and go trawling.

6738. What is the size of their boats?—From 5 to 10 tons, I think.

6739. Are they undecked boats?—They have no deck.

6740. How many men do they carry on board?—They have chiefly two men when they go trawling.

6741. Have you seen them trawling?—Yes.

6742. How many of them have you seen about?—40 or 50.

6743. What sized beam do they have to their trawl?—From 20 to 24 feet; I do not know exactly. I know very little about trawling, except that the trawlers have done us a very great injury.

6744. Where do they trawl?—2 or 3 miles off the land.

6745. Do they trawl all the year round?—Chiefly; there may be some times that they do not trawl.

6746. Do you think that they do you a great deal of damage?—Yes, the Bridlington Bay men used to do us a great deal of damage. For the last 15 years, which is since they commenced, we have neither got whelks nor mussels. Last winter we could not get bait, and we attribute that entirely to the trawling.

6747. Do they trawl the mussels up?—They trawl them up, and when the sea comes they wash ashore. Last winter we could only get 50 lbs. of whelks where formerly we used to get an abundance.

6748. Do you think they do harm to the fish besides destroying the bait?—I cannot say what amount of small fish they destroy. I have been in all occupations connected with long-line fishing, but I never was in a trawler.

6749. Have you never by chance seen the contents of a trawl?—No.

6750. How do the Bridlington trawlers rig their boats?—With one lug and a little bit of jib, the same as we do.

6751. You were talking of the trunk, I understood you to say that it was made with an ordinary hoop, and with a net at the bottom?—Yes.

6752. Is the net fastened to it like a basket?—Yes, it is fastened to the bottom of the basket.

6753. How long is the basket?—About half a fathom; the bait is in the middle.

6754. What bait do you use?—Generally plaice and dabs; anything we can get, but chiefly plaice.

6755. What size is the mesh?—I am sure I cannot say, it will perhaps be three inches.

6756. What do you fix the bait in the bottom with?—There is a band goes across, and we put the bait in the middle. We just make the mesh for a small crab to go through, but we can throw the small ones away if we are willing to do so.

6757. Have you a weight fastened to it?—There are two or three slung together.

6758. What depth of water do you fish in?—From five fathoms to ten.

6759. Do you fish on a rocky bottom?—Yes, it is all rocky.

6760. Have you a buoy on the top?—Yes.

6761. What sort of a buoy?—A cork buoy.

6762. Not a sheepskin buoy?—No; we have a big one at each end; we set them all in a line; there are generally 24 in a line, and they have a big buoy at the end.

6763. Are they made fast?—No, they are all separate.

6764. Does not the tide drive them about?—Yes; if we think the tide is going over strong we take them up and set them in another place where we believe the tide is right.

6765. Do you use fresh bait?—Yes, we always have fresh bait.

6766. How long do you leave them lying at the bottom?—They lie there all night long; we pull them up from one end and then start again.

6767. Do you shoot them at sunset?—Yes, it depends on the weather.

6768. Will they work in the day?—No, only in a rough sea.

6769. Will the fish not take the bait except at

FLAMBOROUGH.

M. Smith.

2 Oct. 1863.

night?—When the weather is fine they will not turn up until night. We used to get an abundance of soles here when I was young; I have been catching from 40 to 50 pair of a night.

6770. Do you catch them with a hook?—Yes, and if we caught 40 pair of soles and 20 stone of haddock, and could realize 1*l.* for them we thought we had done a good thing. Now if we could get the same quantity we could get 5*l.* for them, the fish has got that scarce. I remember in 1832 bringing 600 cod on the shore in winter time, which is the best time for fish selling, and they did not realize 20*l.*

6771. Were there any railways then?—No, we got such a quantity of fish that there was no market for it.

6772. There was no market for it?—We could not get it to any market. I tell you the 600 cod I caught during the winter time in 1832 I sold for less than 18*l.* If I had them now they would be worth during the whole winter and the spring 4*s.* or 5*s.* a piece. If it were not for the advance in the price of fish we should not be able to live now. We have a bit of rock 4 miles square and if it were not for that we should not have a fish on this coast. The trawlers cannot come there, the rock is too hard and the tide is too strong. That is where we get our fish, and there is also a place we fish a little further from the land.

(*A crab net was here produced and its construction explained.*)

6773. Is that the trunk you were speaking of?—Yes.

6774. Do you get small crabs in a net of that description?—They get them also at Cromer and other places, but they throw them away.

6775. Did you ever see any herrings here in January or February?—No.

6776. Nor any appearance of herring?—No.

6776*a*. Not when you have been out long-line fishing?—No, there is a little bay-fishing, but it is done then and we go long-line fishing about that time. I think it has been the regular practice among our old fishermen—it has been so for ages—to set their long-lines over night. The greatest injury done to us has been in carrying our lines away. We have been accustomed to lay our lines with what we call two sets; we take one set with us and bring the ends back with us. We used to lay them from 12 to 18 miles in the spring in the months of February, March, April, and May; now we dare not go there. The trawlers gave the place the name of "California," it was so rich in fish, and now we dare not go there at all.

6777. Do the trawlers go on working there?—Yes.

6778. Do they get fish there?—The fish are about done there. I think they have got the ground all swept up.

6779. Have they been trawling there for years?—Yes, they chiefly begin in the month of February.

6780. But they would not trawl there if there were no fish?—No.

6781. Then how is it that they get fish with the trawl net and you get none with the line?—It is a different fish that they get; we do not catch the soles and the big whelks with a hook. They get soles and turbot; we get cod and ling and skate.

6782. They get fish that you would not catch there?—Yes, but they get what we should catch too and they have taken our lines away as well. One of our fishermen upon one occasion found his lines in a pawnbroker's shop at Hull.

6783. (*Mr. Caird.*) How did they get to Hull in a pawnbroker's shop?—Some of the smack people took them there and sold them; the man had to go and get them.

The witness withdrew.

R. Pockley.

RICHARD POCKLEY called and examined.

6784. (*Mr. Caird.*) Have you long been a fisherman here?—Yes, I have been fishing here ever since I could fish. I was born a fisherman.

6785. Do you agree with the previous witnesses in the statements which they have made?—I agree with Smith in all he has said. I believe his statement is quite right as far as my knowledge goes.

6786. Does anything occur to you to add to his statement?—No.

The witness withdrew.

J. Woodhouse.

JORDAN WOODHOUSE called and examined.

6787. (*Mr. Caird.*) Have you long been a fisherman here?—Yes. I was born a fisherman.

6788. Do you agree very much with what has been said by the previous witnesses?—Yes.

6789. Is there anything you wish to add to what they have said?—I think that this trawling has been a great evil to our long-line fishing.

6790. Have you been in the habit of fishing on the Dogger Bank?—No, that is out of our limit; we do not go there in a small boat.

6791. (*Professor Huxley.*) Did you see that hook contrivance, the trunk for catching crab, here?—Yes.

6792. How far along the coast is it used? Is it peculiar to this place, or is it used all along the coast?—I believe it is only used here and at Cromer. I believe they use a pot in most cases.

6793. But here and at Cromer they use the trunk?—Yes; we think the pot does a deal of harm.

6794. How?—It takes a great deal of young fish; and they are set night and day, and if a fish gets into the pot it cannot get out again.

6795. But surely that is better for the fishing?—Yes, but they are always there, night and day.

6796. You catch the young ones with your trunks as well as they with their pots?—Yes, and I think that that is a great evil.

6797. If you both threw the young ones overboard there would not be much difference in the two ways of fishing?—Not so much.

6798. You think the trunk a better way of fishing than the pot?—It is a deal harder way of catching them.

6799. What is the advantage of using the trunk?—Why any tailor could catch them with a pot, but it takes an expert man to catch lobsters in a trunk.

6800. Can you catch more in a trunk?—I do not know that we can catch more than in a pot, but there is greater labour attending it.

6801. Then what is the advantage of using a trunk, which involves greater trouble, and yet catches very little more fish than a pot?—I think that the pots take all the young ones.

6802. But could they not be equally well put in the water out of the pot as out of the trunk?—Yes.

6803. Do you catch more fish in the trunk than you could in the pot?—No, I think they catch more in the pots, but they catch a deal smaller crabs in the pots than we can get in the trunk, because they only make the spout such a size.

6804. Then the object you have is to catch the larger fish?—Yes, the larger and more valuable fish.

6805. Do you let the trunks stay long on the ground?—From half to three-quarters of an hour; just as long as we think will give time for the crabs to stir as the tide suits.

6806. Do you sometimes give them a little more time to creep in?—Yes.

6807. Can you tell before you begin to haul the trunks up whether you have anything in them or not?—No, but we can tell when we are hauling them up.

The water is thick and we cannot get near in the daytime when the water is not thick.

6808. Are the trunks used anywhere else?—No, only at Cromer and Sherringham and here.

6809. They fish with pots in other places?—Yes.

6810. And do they get as large fish as you do?—No; not half the size; they are doing nothing at all.

6811. Is that because they catch a larger proportion of small fish?—Yes; it is only of late years that the have got their pots.

6812. Did they fish with trunks before?—Yes.

6813. And they have substituted pots for trunks?—Yes.

6814. Is that because they can get more fish?—Yes; they can get more fish half the season, and for the rest of the season, when there ought to be a good supply, it is all gone.

The witness withdrew.

Vickerman Mainprize called and examined.

6815. (*Mr. Caird.*) Have you been long a fisherman here?—Yes, about 40 years.

6816. How many boats were there here about 40 years ago?—I am not able to say.

6817. How many are there now?—I cannot tell exactly.

6818. Do you agree with the previous witnesses as to the falling off of the fish caught by the line fishermen?—Yes, I quite agree with them.

6819. Do you attribute it, like them, to the effect of the trawl-fishing here?—Yes, and I can prove it. There are places where we formerly caught large quantities of fish that we have been obliged to leave now altogether.

6820. What places do you refer to?—Both off Flamborough Head and to the southward of Flamborough Head.

6821. They are places that used to yield an abundance of fish?—Yes, an abundance of fish.

6822. Has that ceased to be the case now?—Yes; we have lost sight of those places now altogether.

6823. Because you cannot catch fish there?—Yes, we left them on account of the trawlers.

6824. Because they disturbed your lines?—They took our lines away and they disturbed the ground as well.

6825. Have you been fishing there lately?—No.

6826. When was it that the trawlers came first upon that ground and prevented you from fishing there?—I think it will be well on to upwards of 20 years since they first found it out.

6827. Is that the ground to which the previous witness gave the name of "California"?—Yes, it was called "California"; we have often got 100 stone of good fish a day, fine good fish weighing from 12 to 14 pounds a stone. They took our lines away and all the fish in them as well; they took our buoys and anchors also.

6828. Did you ever lose your lines?—Yes, more than once.

6829. Have you not been able to get compensation for them?—Not a bit.

6830. Did you not find out who the people were that did it?—Not exactly, we were not there to see them; we laid the lines in at night; we took fresh ones out the next morning to leave when we took the other ones in.

6831. Well, go on?—We went to fetch our lines and we found that the trawlers had taken them away. We could not find them, but there were two or three lots of boats about.

6832. Did you never find them?—We followed the boats up to Hull. We could not find the lines exactly, but we found some of our implements on board the small boats. There was a disturbance among the fishermen and smack owners at that time. Most of the men had struck and the smacks were lying up; we had no evidence as to who had done it, and the consequence was that we could get no recompense.

6833. Was it not evidence against them when you found the tackle in their boats?—The men had left the boats, and the lawyer told us that it would be a great expense to fetch them up. They had gone 400 or 500 miles away to their own homes.

6834. Then you got nothing for compensation?—No; we lost our lines, our fish, and our time also.

6835. In what year was that?—As near as my memory will serve I believe it is about eight or ten years ago.

6836. How many years did you continue to fish on this ground after the trawl-boats came there?—For several years after that.

6837. Did they continue to come in increasing numbers?—Yes, they have been increasing for many years.

6838. Do you think that on this particular ground there are more trawl-boats than there used to be?—Yes, it is only a few years since it was first found out.

6839. Is it a "California" still to them?—They do not still call it "California"; it is not so profitable to them.

6840. Do they not get fish on that ground now?—A little, but not so much as they did.

6841. In your opinion is the herring fishery fallen off?—Yes, I believe there are not so many caught now.

6842. Is there not, if we take into account the increased number of boats that come to catch the fish?—I think not. I do not think there are so many herrings as there were formerly.

6843. What is the reason of that?—I believe myself that the trawlers do a great deal of damage to the fish.

6844. In what way?—When the herrings go to the bottom to spawn, the trawl beam in going across the ground tears up the spawn and destroys it.

6845. Were you ever alongside a trawl-boat when the trawl was drawn to the surface?—No.

6846. Then that is only a matter of opinion?—It is a matter of opinion; but we know this fact, we have found the fishing much worse since they came on to the ground.

6847. Do you complain of any other fishermen interfering with your fishing here?—The French come and disturb us a good bit. They come and take our berths away from us. I have sometimes been prevented from catching lots of herrings in consequence of the French.

6848. Was that within the three-mile limit?—No, it was on the off-ground, but they often come a good deal within the limit.

6849. Do they do more harm on the off-ground than within the limit?—They do most harm on the off-ground. They come in there, they have stronger gear and everything far more powerful than we have, and they come in and shoot wherever they think there are most fish. They never stint themselves to the three-mile limit.

6850. Is there nobody to keep them within their limit?—There was a boat called the "Firebrand" down in Scotland that disturbed the French and took away their nets I believe.

6851. Did she keep the French at their proper distance?—They were always away then.

6852. Did you get any benefit in consequence of that vessel coming to look after your interests?—No, not much.

6853. Did she come here?—We have seen her here on this coast, but she never interfered much with the Frenchmen when here. They disturb us a very great deal at times.

6854. Do you think it would be a good plan if there was any restriction as to the size of the meshes used?—Yes, I think it would be a benefit to us.

6855. Do you think that every one should be obliged to conform to that restriction?—Yes.

6856. Would you like to see a fishery officer stationed here to look after these things?—I think it would be preferable to us.

FLAMBOROUGH.

V. Mainprize.

2 Oct. 1863.

6857. Both with regard to the size of the mesh and the time at which you should fish?—Yes.

6858. Would you rather have some one to do that for you than be left to yourselves?—Yes; there might be a great deal of opinion on such a subject. Every man would wish to do as he liked.

6859. Would you like some one with authority to say what every man should do?—Yes.

The witness withdrew.

(*Mr. Caird.*) Is there anybody here who desires to offer any more evidence? We have gone through the list of witnesses with which we have been supplied, but the Commissioners would be happy to hear anything further that can be said by anyone interested in the fishing here.

There was no response, and the inquiry was adjourned to Saturday, October 3, at Hull.

Hull, Yorkshire, 3rd October 1863.

HULL.

W. I. Markcrow.

3 Oct. 1863.

PRESENT:

JAMES CAIRD, Esq., M.P. (Chairman). | Professor HUXLEY, F.R.S.

WILLIAM ISAAC MARKCROW called and examined.

6860. (*Mr. Caird.*) Are you engaged in the trawl-fishing trade at Hull?—I am not engaged in that trade as a catcher.

6861. Then in what way are you interested in it?—I am interested in it as a smack owner.

6862. Have you long been conversant with the trawl-fishing trade here?—I have been in Hull for 18 years.

6863–4. During that time have you been connected with the trawl-fishing?—Very intimately.

6865. Can you explain the origin of the trawl-fishing here?—I think I can. With regard to the commencement of the trawl-fishing here it is now about 20 years since the trawlers first came here from Ramsgate and Brixham. They have been at Scarborough, however, for the last 30 years and upwards.

6866. I want you to speak only with regard to Hull at present?—The trawlers have been here about 20 years.

6867. Were there no Hull vessels engaged before 20 years ago in the trawl-fishing?—No, I think not; not more than one.

6868. Did the number gradually increase?—It has increased. When I came down here 18 years ago several others came at the same time with me, either from Ramsgate or Brixham. We then mustered about 40 vessels.

6869. Has that number progressively increased up to the present time?—Yes, it has gone on increasing up to the present time. I should say that at this moment we have about 300 trawl-vessels.

6870. Are the vessels now the same size and build as they were at the commencement of the fishing here?—The vessels themselves are nearly double as large; they were formerly about 40 tons builders' measurement, whereas we have now vessels about 80 tons. They generally run from 70 to 80 tons, builders' measurement.

6871. Are they manned now by the same number of men as formerly?—Yes, by the same number.

6872. Then the same number of men are now found capable of conducting vessels of double the tonnage of those employed formerly?—Yes.

6873. Has the increased size of the vessels been accompanied by any increase in the size of the trawl, or the capacity of it to take fish?—We have rather enlarged the trawl. It used to be made about 36 or 38 feet; now they make it 42 feet. The head irons are heavier now. The vessels are of such large dimensions that they would trawl a lighter net over the ground so rapidly that it would be unable to catch fish.

6874. Then the net has been made larger so that it may go more slowly over the ground?—Yes, we have had to put a heavier weight to it.

6875. What was the object of increasing the size of the vessels so much more largely than the net?—We found that by continually increasing the size of the trawl-vessels engaged in the trawl-fishing they became much handier vessels to work at sea. The men can work in the large vessels in very severe weather, which was not the case when the smaller vessels were employed.

6876. You have found it easier for the men to keep the sea owing to the greater comfort and safety afforded by the vessels themselves?—Yes, there is much greater comfort.

6877. And greater safety also?—Yes, and very much more comfort, as they all themselves admit.

6878. Will you describe the mode of fishing adopted now when the vessels go out; how long do they remain on the ground, and when do they return to port?—They keep out at sea for about a month or five weeks, but they send in their fish daily to the market, either here or at London. They have other vessels in attendance which take the fish from them. Latterly we have adopted an improvement, and the vessels carry ice, which enables them to bring the fish into market in better condition.

6879. Do the vessels to which you refer collect the fish from the trawl-boats stationed on the ground?—Yes.

6880. Do they take it to market daily?—Yes, if wind and weather will permit.

6881. Have you ever thought of employing a steamer for that purpose?—No, we fancy that our own boats do the work better. For instance, the trawl-boats are very often scattered, so that one steamboat could not pick up all the fish; but we have five or six smacks probably coming to the market in a day, each having fish from other vessels,—from some 20 or 30 vessels which have got scattered in all directions. One steamboat would have no effect at all in taking in the whole of the fish, inasmuch as the trawl-boats can't be kept close together when employed in the fishing.

6882. Do you find that, by the aid of ice, you can keep the fish perfectly fresh for the market?—Yes; we can keep it in very prime condition.

6883. Has it enabled you to increase the supply of fish for the market?—It is brought in in better condition than it was.

6884. Was it not formerly the case that when the vessels could not come ashore with the fish some of it became damaged and unfit for food?—Occasionally, when the vessels met with contrary winds, it had that effect.

6885. Have you any provision for salting the fish in such a case?—We generally catch fish that would not do for salting, such as plaice, soles, haddock, turbot, and brill. It would not do to salt those fish.

6886. Can you describe to us the mode of fishing adopted when the vessels reach the fishing ground?—They trawl with the tide from six to eight hours and then heave up.

6887. Do they shift their ground much?—That depends upon circumstances; they trawl first upon one piece of ground for a month at a stretch, as long as any of the fish remains there. They know certain spots of ground that they are in the habit of fishing on. They are still discovering new spots, especially in the North Sea. They will fish upon one particular patch of ground for a month, until it is found that the

fish are scarce, when they will remove to another spot of ground. We have here what is called two grounds, namely, the Silver Pits and Botany Gut, which are places noted for large quantities of fish.

6888. Have these grounds been long fished by trawl-fishers?—The off grounds have been fished for the last 30 years from Scarborough, and more particularly of late years the Silver Pits. The Silver Pits were not discovered till 10 years later.

6889. Where is the off ground?—Off Flamborough Head; it lies east north-east of the Spurn, off Flamborough Head about 30 miles.

6890. You say that the trawl-fishers have frequented it for the last 30 years?—Yes.

6891. Do they still frequent it and is it well supplied with fish?—Very abundantly at times.

6892. Has it fallen off in the quantity of fish it yields compared with 30 years ago?—No; there is just the same amount of fish now that there was then; but it is in better condition than it was, particularly with regard to haddocks and plaice.

6893. You spoke of the Silver Pits, what kinds of fish are caught there?—We catch there generally the kinds of fish we get on the off grounds, such as soles, brill, haddock, cod, ling, halibut, turbot, and other kinds of fish.

6894. Have the Silver Pits been long visited by trawlers?—Yes, about 20 years.

6895. Have you observed any diminution in the catch of the fish there compared with what it was 20 years ago?—It certainly depends upon circumstances. It depends in a great measure upon the severity of the weather. The Silver Pits were first discovered in a severe winter, and multitudes of fish were then caught. If we have a mild winter we don't get any large takes of fish, although we still get a sufficient quantity to supply the market; but when we have a severe winter this fishing ground, being in deep water, becomes much frequented by the fish. They fly to that spot in large numbers and we catch very large quantities. Three years ago extraordinary quantities of fish were found there.

6896. Have you found that by continually fishing that ground its productiveness in fish has diminished?—No, not in the least.

6897. Has it increased?—I should say that it has increased. I have my reasons for believing that the quantity of fish caught in the North Sea and German Ocean is more now than it was 20 years ago.

6898. Confining yourself to the Silver Pits, you say you have been enabled to observe, that instead of diminishing they are increasing in productiveness?—They increase according to circumstances. If we have a cold freezing winter, then fish are found there more abundantly than they were at the onset, when the ground was first discovered.

6899. Has the number of vessels fishing at the Silver Pits increased or diminished?—Increased.

6900. It has increased?—Yes; the vessels go there in cold weather knowing that they are sure to catch large quantities of fish.

6901. Is there any fishing bank here which in consequence of its great productiveness in fish is known as "California"?—Yes, there is a place known by that name near Flamborough Head, just off the land.

6902. Is that piece of ground not fished by the trawlers?—It is in the spring of the year, up to the months of May and June, but not so much as it used to be.

6903. Are you aware that that ground has been impoverished by the trawl-fishing?—I don't know that I may not admit that that little spot has been, but the number of fish that spawn there compared with the number in the deep sea is extremely trifling.

6904. Then if I tell you that we have it in evidence that the quantity of fish on the bank called "California" has greatly diminished of late, you agree that it is not beyond probability?—Yes, I think so, but it is only a small spot of ground.

6905. How do you account for the diminution?—Well, the fish being harassed have no doubt shifted, and gone to other parts to spawn.

6906. Then you admit that there the trawl-boats have diminished the power of the line-fishers to catch fish?—I don't think there was any fish there that the line-fishers could catch. I never understood that it was a particular spot of ground for line-fishing at all.

6907. It was stated to us yesterday that it was a ground very prolific to the line-fishers previous to the trawlers going there?—I never understood it to be so. The line-fishers—I speak of the Filey and Flamborough men—go more to the northward than California.

6907*a*. With regard to the Dogger Bank have you had any practical experience of the fishing there?—Yes; there is a great abundance of fish to be caught there at any time of the year.

6908. Have the trawl-vessels long been in the habit of going there?—No, they don't care about going there. They get so much fish when they go there that they are afraid of overstocking the market.

6909. Is it more prolific than any other place the trawlers frequent?—Yes, for plaice and haddocks.

6910. Is it really the case that fishermen don't go there because they are afraid of catching too many fish; is that really so?—Yes, that does occur. The reason is that they would over supply the market. They could catch as many off the Dogger Bank in 24 hours as would supply all England for 48 hours.

6911. Would not that be remunerative?—No; it would bring the market down.

6912. Then have you reached such a point that you can easily overstock the market?—We send fish now to London, Liverpool, Glasgow, Edinburgh, Manchester, and all the great markets in the kingdom, and we find at times that we have overstocked the market with soles, plaice, and haddock. We could overstock it invariably if we chose.

6913. In regard to the Dogger Bank you say the effect of trawl-fishing has not been in any degree to diminish the quantity of fish to be found there?—No; if anything, there are more fish there now than ever, and they are in better condition.

6914. Have you ever seen a line-fisherman on the Dogger Bank?—No, I have not.

6915. Can you give us a statement of the capital invested in trawl-fishing?—The cost of a trawl-vessel will vary from 700*l.* to 900*l.* I have known some trawlers cost as much as 1,000*l.*, but the cost generally runs from 700*l.* to 900*l.* I have paid 800*l.* and 850*l.* when materials were dearer than they are now.

6916. Does that include the cost of fishing tackle?—Yes.

6917. What may the fishing tackle cost?—A trawler will carry two nets, two beams, two pair of heads, two ground ropes, and a double set of several other things. I should think that at the present time the fishing tackle would cost, complete and fit for going to sea in the vessel, about 70*l.*

6918. Then the fishing tackle of a trawler is not so expensive as that of a long-line fishing boat?—Yes, they will cost far more than long-lines; I am satisfied that long-lines never cost the money the gear of a trawler will come to. There is no weight in the lines of a fishing boat.

6919. We have it in evidence that the tackle of a long-line fishing boat amounts to more than 70*l.*?—Never; you must have been misinformed. They have no weight of lines to cost that sum.

6920. But including the drift of nets it would cost that?—Yes, because they have a large quantity of the warp rope attached to the nets. That would be one consideration.

6921. Then to get all that together would cost more than the tackle of a trawl-boat?—So far as a herring-boat tackle is concerned a large boat with her herring nets and warp rope would perhaps run up to 200*l.* and even more.

6922. So that the fishing tackle of a line-fishing boat with herring nets will cost considerably more than the tackle of a trawl-boat?—Yes, I should think so.

HULL.

W. I. Markcrow.

3 Oct. 1863.

6923. In your estimation what capital may be invested in the business of trawl-fishing in the port of Hull alone?—That is a matter I have hardly taken into consideration. A few years back I did, but I have not done so of late. It must be something very enormous although I cannot give you any information with regard to the figures. It is a subject on which I have not thought much recently.

6924. You have stated that the number of boats at present is about 300?—I was speaking then of the Humber.

6925. But not including Grimsby?—Yes, I took Grimsby also.

6926. You included Hull and Grimsby?—Yes, I meant the Humber.

6927. Then taking the number of vessels in the Humber at 300, would it be fair to say that in round numbers about 300,000*l.* is invested in the trawl-fishing?—Yes, you may say that within last two years the number of vessels employed in trawl-fishing from this port has been greater than at any other period.

6928. Has an increase taken place particularly within the last two years?—Yes, particularly.

6929. Can you tell us the amount of the increase within the last two years?—If I was to take three years I should venture to say that there has been an increase of 30 vessels a year during that period.

6930. Thirty new vessels every year for the last three years?—Yes.

6931. That will be equal to an investment of 30,000*l.* outlay every year?—Yes, 30,000*l.*

6932. Have these vessels been paid for or are they under mortgage, as a general rule?—That is a point I cannot enter into. We have not the pleasure of knowing the depth of any gentleman's pocket here.

6933. I have no desire to be inquisitive. We are only anxious to get at the bottom of the matter in relation to statements which have been made to us at other ports. We have been informed that there has been a great increase in the number of trawl-vessels, but we are also told that it has been a purely speculative increase and that it has not proved remunerative. Now I should like to hear from those who have the best right to know what is really the state of the case?—I believe that many vessels have been paid for at the time they were purchased, but no doubt there are others which the parties were not able to pay for at the time they obtained them, and in which the assistance of friends was called in. I find the same thing has been done very extensively in France. The other day I saw 10 new boats on the stocks at Calais. They were all built upon the same principle. I was talking to a gentleman well acquainted with the circumstances under which they had been built, and he stated to me that they were provided entirely by the tradespeople and that the fishermen did very little towards paying for them. You will therefore see that the same goes on wherever fishing is practised.

6934. I presume that if people invest their money in boats of this sort they must find the investment lucrative?—It has been lucrative up to within the last year or two. I am sorry to say that there has been some falling off during that time, and that there have been several failures which have done considerable evil. They are attributable more to recklessness than loss in the fishery. People, when they get a friend sometimes to assist them in putting a vessel to sea, fancy that it is entirely their own and make very easy with their money, and when the day of reckoning arrives they find themselves minus. The people who have advanced the money find that it is not forthcoming, and they take the vessel instead. But this has arisen entirely from recklessness and not from any deficiency in the earnings of the fishermen.

6935. Is it the fact that the trawl-boats which go from Hull bring back as large catches of fish as they did when the business was remunerative?—Yes, I think the catches of fish are larger.

6936. Larger?—Yes, they catch larger quantities of fish.

6937. Can you give us any reference to figures by which you can show what the weight of fish caught now is compared with what was caught in previous years?—I can tell you this, that as far back as 16, 17, or 18 years ago, or even 12 or 13 years ago, which would be the first six years of my being in Hull, the railway carriage was so enormously high that we could not send fish to the market. There was a very large quantity of fish caught, but it was thrown overboard as soon as it was caught. Baskets of fish were sold for smoking, to be converted into what are called Finnon haddocks; that is a trade that is now almost extinct with us. All the time it was carried on we made 2*s.* 6*d.* a basket for haddocks, but now we can make 15*s.* or 16*s.*

6938. Have you any figures by which you can show us, on the average, the quantity of fish brought to the market at Hull, by the trawl-vessels?—No, I have not.

6939. Is there any record by which you can ascertain that?—I think not.

6940. Is there no person connected with the trawl-fishing trade at Hull who keeps any record of the quantity of fish brought into the port?—The Dock Company I believe take an account of all the fish per basket.

6941. Do you think they can give us an account as compared with former years?—I think not as compared with former years. The vessels did not go into the dock at all formerly.

6942. Why was that?—Because the dock dues were then 6*d.* a ton, and it was more than we could afford to pay. We petitioned the Dock Company to reduce them; they did so down to 2*d.* a ton, and we then all went into the docks. Since then we sent a further petition which induced them to reduce the dues to 1½*d.* a ton. From that time until the present I don't think we have had a single vessel lying in the roads; they all go into the docks.

6943. What time is it to which you refer?—About 12 years ago.

6944. Then do you think we can obtain a record for the last 12 years?—I think you may. The Dock Company are now in the habit of charging one halfpenny per basket in addition.

6945. Do you bring as many turbot ashore as in former years?—I think if anything there is an increase in turbot.

6946. Shall we be able to find that from the record you speak of?—Not from that; but I think the evidence you will hear to-day will convince you.

6947. Has there been an increase or a diminution in the haddocks caught by the trawlers?—There has been a very large increase.

6948. Has there been an increase in skate?—No; we don't reckon upon a deal of skate.

6949. Did you yourself come from the southern coast?—Yes, from Ramsgate.

6950. Did you find that the ground off Ramsgate had ceased to be productive before you came north?—I was at Ramsgate a few weeks back and I found that they were getting as much fish at certain seasons of the year as ever they did.

6951. Then that was not the cause of your shifting your residence to the north?—No; at certain seasons the fish move into different quarters of the world.

6952. It is alleged against the trawl-fishing system that it destroys enormous quantities of spawn?—I never heard a trawler state that he had caught spawn at all.

6953. Have you ever seen spawn in a trawl net?—No, I have never seen it; but I have heard the trawlers say that when they took out the inside of any plaice, haddock, or whiting, which they caught during the warm weather, they found that the fish had been full of spawn, and they got large quantities in that way. Considerable quantities have in point of fact been lying upon the deck that have come from the fish that have been gutted, but they have not brought it up in the trawl.

6954. Did you never hear of spawn being disengaged

from the bottom and brought up in the net?—No, never.

6955. Is it a fact that much of the fish brought to the surface in the trawl net is so mangled that it is unfit for human food?—I have never seen it. If any of the fish were mangled the fishermen would no doubt throw them away at once. No doubt it may happen occasionally in catching a large draught of fish that one or two may be injured, but if so they are thrown away.

6956. What I want to know is whether any large proportion of the fish brought up are in that state?—No, only a very small quantity.

6957. What quantity of fish is brought up at a single catch?—Sometimes we may get a ton and a half or two tons of fish.

6958. Then of that ton and a half or two tons, how much would be mangled?—There would scarcely be a small basketful.

6959. Do you also bring up large quantities of immature fish?—Not very large quantities. Occasionally there are small quantities brought up; that will occur at almost any time.

6960. Are these small fish quite unfit to be sent to the market?—They would not pay the carriage for them to send to market, but people consume them in the immediate neighbourhood.

6961. Then they are not thrown overboard?—Some may be, but the gurnets, dabs, and little skate are brought away and sold.

6962. Are those which are thrown overboard dead?—Yes, no doubt; but they go there as food to the other fish.

6963. I understood you to say that a small basketful of the fish may be mangled; what proportion may there be of small immature fish?—Perhaps what we call "half a pad." We have two sizes of baskets, pads and half-pads.

6964. Have you ever observed the gall bladder of the fish burst?—Never; and I have had the handling of the fish for some hundreds of times.

6965. Have you ever observed the scales rubbed off?—That might occur when we have had a strong wind, but the fish generally have them on.

6966. Are the fish alive when they are brought up?—I have seen them alive on the deck here, particularly plaice.

6967. We have been told that 400 vessels would destroy 400 tons of spawn in a short time; do you believe that statement to be a fact or not?—No, I believe it to be entirely erroneous.

6968. Is the spawn ever sold here for manure?—I never saw any spawn sold at all. With regard to manure, if by accident a vessel met with bad weather and the fish were kept until it became unsaleable, it is seized and thrown away. There is one thing I should like to mention, namely, that the fish from Hull is selected by all the principal towns in England in preference to the fish even from London and all other parts. A very large quantity of the fish brought to Hull goes to Bath, Cheltenham, and even to Exeter, Glasgow, and Edinburgh, and all the midland towns. They prefer the fish caught and brought into Hull to the fish they can get at the London market.

6969. Why is that?—They find our fish is generally in better condition, and another point combined with that is, that our fish is more moderate in price.

6970. Do you think that the fish here is more moderate in price than in other markets?—Yes, I consider so.

6971. Has the price of fish increased very much in the market during the last 10 years?—No, it has not increased in the direct market for consumption. But what has increased the price of fish here is, that the railway companies have reduced their charges so that fish now find a transit to all parts of the United Kingdom. They used to charge 12*s.* a basket for plaice, which had the effect of prohibiting the article from being sent away. The result was, that whenever we caught haddocks and plaice they were thrown overboard.

6972. Why was that?—Because the carriage was heavy and we could not send them away to make a profit out of them. I went, when Mr. Hudson was chairman of the York and North Midland line, to Derby, and remonstrated several times in reference to the charges for the carriage of fish. 14 years ago they reduced the charges, and we have continued to send fish to the markets. There was a time when we did not send offal fish (plaice and haddocks) to the market.

6973. Is the price such as to admit of the poorer classes consuming it?—Yes.

6974. Then the price has not increased so as to place it beyond the power of the poorer classes to buy it?—No.

6975–76. Are you able to send your fish to such large towns as Manchester at such a cost as permits it to remain at a price within the reach of the poorer classes?—Yes, I think so. But I have heard complaints at Hull that they don't get fish as cheap as they used to do. At the time they refer to they had only a few cod and skate brought to the town. They had no trawlers at all, whereas the trawlers now supply the market all the year round, and they cannot expect to have the fish given to them.

6977. Do the trawlers fish all the year round?—Yes.

6978. Without any intermission?—Yes.

6979. Is there no particular season for some fish?—No, we find fish in good condition all the year round. I believe the fish when they spawn are not on this coast at all.

6980. Where do you think they spawn?—I believe to the northward, in the North Sea.

6981. Is there any spawn found on this coast?—There is but a small portion of the fish that comes on this coast to spawn; the great bulk goes to sea. The haddock, ling, and cod go to the north, and the soles go southward. I have one great reason for saying this, and that is, that whenever the spring of the year comes an abundance of small soles are caught off the Dutch coast. They catch scores of tons in a night, and that induces me to believe that soles go to the Dutch coast to spawn.

6982. Have you ever fished there?—There are vessels which go there to fish during the spring.

6983. Do they fish among the Dutch fishermen?—Yes.

6984. Do the Dutch fishermen practise the trawl system?—Yes.

6985. Have they done so for many years?—Yes.

6986. Did they practise it before you did?—I should think that their trawling has been carried on for ages.

6987. Are there French trawling boats in great numbers?—Yes, I have seen 150 sail out of Calais alone. I have also seen large numbers at Dieppe, Dunkirk, and Boulogne. I have seen as many as 200 sail.

6988. Are they of the same build as your own trawlers?—They are luggers mostly with three masts.

6989. Are they generally of the same size?—No, they are about 40 or 50 tons, builders' measurement.

6990. Do they carry the same description of tackle?—They carry a trawl, but it is different from ours. The mesh of their net is different. The upper part of the net, which we call the "square" of the net, is smaller than the lower part of our net.

6991. Do they catch in consequence a larger number of small fish in proportion?—Yes, in Calais, on Sunday, Monday, and Tuesday last, I found that they were bringing a great deal of small fish into harbour, such as gurnets, dabs, and weevers.

6992. Smaller fish than you are in the habit of sending to market here?—Yes.

6993. Are there any line-fishers off their coast—are any of the Dutchmen or Frenchmen line-fishers?—Yes, Frenchmen are noted for line-fishing.

6994. Do they practise it among the trawl-fishers?—Yes.

6995. Do you ever have any complaints from them?—No.

HULL.

W. I. Markcrow.

3 Oct. 1863.

6996. Do you fish among them?—Yes.

6997. Do you never get foul of the line-fishers' lines?—No.

6998. Have no claims ever been made against the trawl-fishermen of Hull on account of having destroyed the long-lines of the fishermen?—I never knew of such a claim being made.

6999. Have you known any instance in which the general practice of fishing by the line has been superseded by trawl-fishing in the same port. Take Ramsgate, for instance?—Ramsgate was never noted for line-fishing.

7000. Do you know of any place noted for line-fishing that now practises trawl-fishing?—Scarborough is as noted a place as I am acquainted with; they still carry on line-fishing, but I don't know trawl-fishing practised anywhere more than at Scarborough.

7001. Does the trawl-fishing require different accommodation from line-fishing; does it require, for instance, a better harbour?—If they had no harbour to go into it would be impossible to trawl. The trawlers draw 9 or 10 feet of water, and if they had no harbour to fly to it might become awkward for them. A few years back I went down to Seaham to see what I could do there in the way of providing accommodation for trawlers. I examined the harbour, but I found it would not do. It was a dangerous harbour to approach, and it had no room in it. Of course I declined to go there.

7002. As a practical fisherman, can you tell me which is the best school for seamen, the trawl-fishing or the line-fishing?—The trawl-fishing.

7003–4. For what reason?—They are always learning the art of a seaman. There are no better seamen in the world. I have been acquainted with captains who have taken trawlers as part of their crew in preference to any square-rigged sailors. They are much more courageous; they will endure greater hardships, and they render great service to ships in distress. If they only see a ship in distress they will at once put off their small boats and do all in their power to rescue the crew, while the square-rigged sailors would not leave their ships.

7005. In practice, have you found that the trawl-vessels do very often aid vessels in distress?—Yes, they render assistance to a great number of them. Not a year passes in which they don't render a deal of service.

7006. Is it from their local knowledge of the coasts they fish upon that they are enabled to render special service to strangers?—It makes no difference whether they are strangers or not to them. They would not allow a ship or person to sink if it were possible for them to save them. They are always at sea, and they never run into a harbour in consequence of bad weather. Therefore they are always on the spot, and more or less ready to render any service that may be required.

7007. (*Professor Huxley.*) Have you been engaged practically, Mr. Markcrow, in the trawl-fishing?—No.

7008. You speak particularly as a smack owner?—Yes, and as a fish dealer. I have sent great quantities of fish all over England.

7009. You spoke just now of the French and Dutch trawlers; do they ever come over to the ground at the Dogger Bank?—Yes.

7010. Do the boats of different nations fish among each other?—Yes.

7011. Do they interfere with each other?—They don't interfere to the annoyance of the trawlers, but they do to others.

7012. The trawlers can, if they choose, keep perfectly clear of each other?—It is very rarely that a collision occurs.

7013. They ought never to come together, ought they?—One vessel being ahead of another may become fast to a wreck, or anchor, or something of that kind, and before she can alter her course another may be foul of her.

7014. You said a little while ago that the trawl beam of the trawl you use here is about 42 feet long?—Yes.

7014*a*. Why did you have it with the small boats 38 feet long?—They fancied it was necessary to have it that length for the purpose of catching a sufficient quantity of fish.

7015. Did you ever hear of any law on the subject?—I have heard that there is a law restricting the length of the beam, and also the weight of the head irons.

7016. You have heard of the Convention between this country and France?—Yes.

7017. Did you know that the Convention contained a number of articles relative to trawl-fishing?—Yes.

7018. And that some of those articles regulated the size of the net, the length of the beam, and other matters?—Yes.

7019. For example, there is the 18th article, which says:—"The length of the wooden yard or beam to "which the upper part of the mouth of each trawl-"net shall be be fastened shall not exceed 38 feet;" you say here, that all your boats are violating that law?—I suppose it was not thought at the time the law was made that there would be such fine vessels engaged in the fishing.

7020. I don't speak of the motives or intentions of the Government in entering into that Convention; I only refer you to the articles of the Convention itself, and they have been in existence since 1843?—Well, so far as I am concerned, I hope that that article will be rescinded.

7021. Have you ever been in the habit,—have the smack owners here ever been in the habit of paying any attention to this Convention and Act of Parliament?—I can't say that we have.

7022. Is there anybody to interfere with you and take notice of the size and length of your trawl beam; have you had any fishery officer to examine the length of your trawl beams and the size of your nets?—I cannot say that we have.

7023. Not only is the length of beam regulated in this Act, but also the size of the mesh. Can you tell me whether on the ground rope or foot rope you are in the habit of placing any weight?—No, we are not.

7024. Not at all?—No, it is merely bound round; it is rounded with a small portion of the rope it is made of. Part of the rope is put round and round it.

7025. What is the size of the smallest mesh used in your trawl net?—About $2\frac{1}{2}$ inches.

7026. Two and a half inches from knot to knot?—Yes.

7027. Have you none of the meshes smaller than that?—I think none are larger than that, and that would apply to the lower part of the net. The mesh is larger as it comes upwards.

7028. What is the weight of the head iron that you use here?—About 170 or 180 lbs. each.

7029. Then together they would weigh 340 or 360 lbs?—Yes.

7030. Did you ever hear of this article: "The total "weight of the two irons or head pieces of a trawl "shall not exceed 287 lbs"?—I can't say that I ever noted that in particular, but we have been compelled to use head irons of that weight in consequence of using so much heavier vessels in the fishing.

7031. I am only asking you what is the fact; you do use heavier head irons than the law sanctions?—Yes.

7032. In point of fact, these articles have been a dead letter here ever since you have been a smack owner?—Certainly we have taken no notice of them.

7033. If nobody calls your attention to the law, you think it is no business of yours?—We consider that the sea is free, and we invest our capital in it.

7034. Would you be pleased if these articles were enforced?—No, I think the weight of the head irons and the length of the beam as laid down in these articles would be most injurious. To use tackle of that description would make the gear so light that the large vessels we use now would swim their gear.

7035. Looking at these articles, it certainly strikes me that if these laws were enforced you are every-one of you here liable to fine and imprisonment?—I hope not.

7036. In point of fact, I presume the Act of Parliament has always remained a dead letter in this port?—Yes.

7037. Have your trawl-vessels been in the habit of fishing where there are boats engaged in the herring-fishing?—Our vessels fish on the ground where the herring vessels come. When they have made their season they go further off and our vessels take up their position.

7038. Have you ever heard of anything that obliges your vessels to keep out of the way of the herring boats?—I have heard that we ought to keep out of their way, but I think it is a very great hardship.

7039. Did you know of this article: "Trawl-boats "shall always keep at a distance of at least three "miles from all boats fishing for herring or mackerel "with drift-nets?" Are you aware of that?—Yes, I have heard of it.

7040. Have any of the fishery vessels on this coast ever attempted to enforce that law?—I never heard of them doing so.

7041. Is there a fishery vessel or gunboat on this coast?—Two years ago there was, but I never hear of it now.

7042. Have you ever heard of trawl-vessels being interfered with by a gunboat?—No.

7043. You never heard of such a thing?—No.

7044. If already trawling, you are bound by the convention to go away when the drift net boats come there. There is this article, for example, contained in the Convention: "Trawl-fishing is for-"bidden in all places where there are boats engaged "in the herring or mackerel drift-net fishing." Did you ever know drift-net herring or mackerel boats attempt to enforce that law?—No.

7045. Perhaps they know as little about it as you do?—I know nothing about that. I think it is a great hardship that if a trawler has taken up his position, with perhaps 130 or 140 fathoms of warp out, which it will take him hours to heave up again, that he should be obliged, if herring or mackerel boats come down upon him, to get out of the way. When he sets his net the herring fishermen may be driving with the tide, and, as trawlers don't go as fast, the consequence is that the herring boats come across the trawler, and 25*l.* or 30*l.* worth of injury is done before the trawler can get out of the way; yet they want compensation from the trawler for the damage done to their nets. Now I think it very hard that the trawler should have to stand both damages.

7046. But as the law stands, it says that trawlers must get out of the way if the drift-net boats come?—Well, all I can say is that I hope the matter will be looked into and altered.

4047. Do you think the enforcement of these laws would inflict any great hardships upon the trawlers?—Yes, the enforcement of that law would be a very serious hardship.

7048. We have it in evidence that the long-line fishermen complain a great deal of the carrying away of their lines by the trawlers at night. I understood you to say that you know of no complaint of that kind on this ground?—No, I know of none.

7049. Are you aware whether the persons in your employment have ever carried away bratt nets in trawling which have been set on any part of the coast?—No.

7050. Are you aware that the long-line fishermen have been driven off their ground on this coast in consequence of not daring to set their lines where your trawlers have been sweeping the ground?—No.

7051. Have no complaints ever been lodged with the Hull magistrates?—No.

7052. Have you noticed any diminution in the size of the haddocks caught of late years, comparing them with the size of those caught formerly?—During the last 20 years the haddocks we have caught have been finer fish than have ever been since we have fished on this coast.

7053. What is the average length of the haddock caught by your trawlers?—From 12 to 18 inches.

7054. Would not 18 inches be rather a fine fish?—Yes, but I believe there are abundance of those we catch that would measure 18 inches.

7055. Comparing your experience of trawled fish now with what it was 20 years ago, has there been any diminution in the size of the fish?—They are finer fish, they are better fed, and they are altogether finer.

7056. The general evidence we have had so far is that the haddocks have become smaller, and that they cannot catch them in such large quantities as formerly. They say that there are no fish to catch at all now. I ask you if you have noticed any diminution in the size of the haddock caught by the trawler, and you say no?—As far as the quantity is concerned we catch treble the quantity we caught 12 years ago.

7057. Can you give me any idea why, if the fish are there, and they are such fine fish, the long-line fishermen can't catch them?—I believe the fish shift their ground. I have known large quantities of haddocks caught at the North Foreland off Ramsgate and Margate, while in some places the fishermen have not caught a haddock. I have known, in some seasons, very large quantities of haddock caught in Rye Bay, while in other seasons they have not got a basketful. In some days they got 20 and 30 baskets-full at a haul.

7058. Then am I to understand that, in your opinion, even if the haddocks were left to themselves at times they would be plentiful and at other times scarce?—Yes.

7059. You explained the dearth of fish upon the so-called "California" bank by supposing that they had been driven away by the fishing operations?—I imagine that they don't find sufficient quietude for their spawning, and that they have consequently gone away; but the quantity of fish that came there to spawn was very small.

7060. Then you believe that constant trawling over a fishing ground may frighten the fish away?—Yes, for a time.

7061. Do you think they will return?—The fish are not caught there except in the spring of the year, but wherever the ground is stripped and barren for a time, I believe the fish will come again in great numbers.

7062. It is possible to strip the ground you think?—Yes; taking into consideration what is caught and what will remove.

7063. We have it in evidence that the trawlers have trawled over a spot of ground two miles broad and 20 miles long for eight weeks in succession, and that they have always found an abundance of fish there?—It is quite likely; the deep sea is continually supplying the fish.

7064. Do you think trawling might go on for a great space of time and not drive the fish away?—I know a little bit of ground off the North Foreland at Ramsgate on the south ground. They continue fishing there during the whole of the summer. There is very rough ground outside, and between that and the land they are continually fishing. The fish go in there to feed. As the trawlers plough up the ground, the lug-worm, shrimps, and other things are turned up, and the fish go in and take them as food.

7065. Do you think that any patch of ground is being constantly stocked by immigration or by some other means?—Yes.

7066. But if it was ground that was not good feeding ground might it not be permanently stripped?—No, not permanently; at least not for long. I don't think that the fish come into shoal water in the winter time. The largest quantity of fish caught in the Silver Pits is caught in the cold weather. I think that is a proof that the fish go into deep water in the severe weather.

7067. Do you catch many codfish in your trawls?—Sometimes we catch 20 or 30; sometimes only two or three.

HULL.

W. I. Markcrow.

3 Oct. 1863.

7068. What is the principal fish you take?—Soles, brill, turbot, haddock, and plaice.

7069. Do you catch soles and plaice when they are not caught by the long-line fishermen?—Yes, we catch soles and plaice that would never be caught by the hook.

7070. But the long-line fishermen can catch them, can they not?—If we had not more soles than are caught by them there would be a very scanty supply.

7071. I believe that soles are largely eaten in London?—Yes.

7072. Then, if trawling were put down and they were only allowed to be caught by the hook and line, do you think the supply would be less than it is now?—There would not be enough to feed Her Majesty's establishment, let alone the general public.

7073. Then putting down trawling would be a great benefit to the soles, but to nobody else? The long-line fishermen would never catch them?—No, the long-liners can only go to sea at particular times. Our boats go to sea at all times, blow high, blow low, whether it is freezing or snowing. It very rarely occurs that the London market is left without plaice, soles, or haddocks. When there is severe weather occasionally the codfish caught by the liners will fetch a guinea, while soles, brill, and plaice are abundant.

7074. There is a great deal of turbot caught by the bratt nets?—Yes, I believe so.

7075. Then the market might be supplied with turbot?—Yes, but it would be a very scanty supply. The further we go to sea the more we catch. We catch now what the Dutch used to catch.

7076. May you go as near the Dutch coast as you like?—Yes, we have never had any interference with us.

7077. Have you, as a fish salesman, had occasion to go to the same markets as those in which the hooked fish are sold, or to send to the same?—Yes, I have had occasion to send to the same.

7078. Have you found that your fish were driven out of the market by the hooked fish?—They always give the preference to trawled fish. If a fishmonger wants supplying, he will give a preference to the trawled fish on account of the many different kinds he can get. If he buys hooked fish only, he will merely get cod and haddock, whereas if he buys trawled fish he finds soles, turbot, and brill, which the cod catchers can't get at all.

7079. Do you mean that if a fishmonger wants to contract with a fish salesman, he would sooner contract with a man who gets a regular and varied supply than with one who only gets hooked fish?—Yes.

7080. But suppose you sent trawled turbot into the market at a time when hooked turbot is in the market, will the hooked turbot get a better price than your trawled turbot?—That is a thing I have very rarely tested. I have seen scores of Filey and Flamborough boats in Hull with their fish and there has rarely been a turbot amongst them.

7081. How is it with your trawled codfish; do you get as much for trawled cod as the line fishermen get for hooked cod?—We mix them with plaice, skate, and haddock. We always make a mixed basket; we think that suits the market in England better.

7082. Have you ever known the market for your fish interfered with by line fishermen on account of the preference given by the public to fish caught by the hook?—No.

7083. Have you on the contrary, been able to lower the price to the consumer?—I have no doubt that fish is sold at two-thirds less price than it would be if the markets were dependent entirely upon the hooked fish.

7084. Then do you drive the long-line fishermen out of the market?—They cannot expect to cope with our men in the quantity of fish they send to market. Our men deserve all they earn, inasmuch as they are always at sea. If there is a gale of wind the long-line fishermen dare not leave the shore. If in this country there was no more fish than what the long-line fishers catch, there would scarcely be enough for a half or even a quarter of the public.

7085. Have you ever heard that the fish consumers have complained to the people who buy the fish from you as to the quality of the trawled fish?—No, I never heard of such a complaint.

7086. Have you ever heard of people becoming ill in consequence of eating trawled fish?—Never. They might be ill, but it would not be the fish that would make them so.

7087. We have evidence of that fact?—Then it has been very bad evidence.

7088. What do the crews of your smacks live on?—They take a great deal of beef with them, and they eat a good deal of fish. They have fish to breakfast, meat to dinner, and fish to supper, and they look as hearty a race of men as you would wish to see.

7089. You never heard of their being laid up in consequence of eating trawled fish?—Never.

7090. I don't want to pry into the circumstances of the men engaged in your particular trade, but it is necessary that we should inquire how the capital is invested in the business. Can you tell me if the money put into the smacks here is put in by large capitalists who wish for a good investment?—No, I think not.

7091. Is it invested more by individuals who seek a good enterprize?—Yes. The large capitalists don't put any money in it at all.

7092. Has there been much speculation in the business; have there been many people who have put in money on the chance of getting a good return?—Those who have invested have invariably got five per cent. for the use of their money.

7093. Have they always got five per cent.?—There may have been exceptions, but money as a general rule is advanced to the fishermen at five per cent.

7094. Is it an easy matter to get money at that rate of interest in the smack trade?—I don't know that it is perfectly easy, but it invariably occurs that a man is first of all a fisherman, and that he must have a little capital of his own. When he has been fortunate enough to find a friend who will lend him a little money, by that means he gets a vessel, perhaps a secondhand one, but occasionally a new one.

7095. (*Mr. Caird.*) You mentioned in answer to a question from Professor Huxley that you sometimes carried away the herring nets to a considerable extent in your trawls?—It does occur sometimes that the trawler loses his gear.

7096. Could not some regulations be adopted by means of which the trawlers would be enabled to keep clear of the herring fishermen during the time the herring-fishing is going on?—The herring fishermen commence their fishing along the coast, and as the season advances they find the fish falling away to the deep sea. Wherever the trawlers go they follow them. Wherever the trawlers are there they will be, for it appears that the herring, when in deep water, will go at times down to the ground. The trawlers disturb the fish and they come up to the surface, and upon that account the herring driver will approach as near as he possibly can to the trawler, much to his annoyance, for the purpose of catching as much fish as possible.

7097. That is in the deep water?—Yes.

7098. Would it be any hardship to the trawlers to be excluded from in-shore fishing during the herring season?—I think our vessels fish but little in-shore during the herring season.

7099. If they were entirely excluded would it be a serious hardship?—I don't know that we should feel it a very great hardship; the herring-fishing only lasts for a short season.

7100. You stated that soles don't come in-shore much at all?—Only during the summer time.

7101. Are you aware that there is a very considerable sole-fishing carried on in Bridlington Bay?—Sometimes there is.

7102. Is that in cold weather?—No, they will not get soles there in cold weather; it is in the months of June and July.

HULL.

W. I. Markcrow.

3 Oct. 1863.

7103. In your experience as a salesman of fish, have the markets in the country been gradually extended?—Yes, very rapidly.

7104. Do you send larger quantities to the manufacturing towns than you did in former years?—Yes, very considerably. For the last 17 years I have been travelling all over England, Scotland, and Ireland at the expense of the North-Eastern Railway Company to open markets. In many of the towns I went to there was not a fishmonger's shop and never had been; and it was just a chance to have a few fish brought in by a hawker travelling with a donkey. There are now four, six, or seven fishmongers in such towns, all of them getting a living, and all of them taking their fish from Hull.

7105. Do you think they could be supplied if there were no trawl-fishing?—I am certain they could not be supplied if trawling was done away with. It is only during part of the year that the long-line fishermen would fish at all, and they would not care who wanted codfish or anything else when the herring season came on. They always leave the cod-fishing to go to the herrings. They then want a few weeks to spend what they have made, and they then commence again their long-line fishing. If trawling was done away with the country would sustain a serious loss.

7106. Then if the markets have been constantly extending in the interior of the country, has the price of fish increased in consequence of that increased demand, or has it been stationary?—It is ruled entirely by the supply.

7107. Is your supply equal to the increased demand?—Yes.

7108. I suppose that every new market would open up an increased demand?—Yes.

7109. Have you found that you are capable of meeting that increased demand by an increased supply?—Yes.

7110. And yet you have not found that that has made a difference in the resources of your supply?—Not at all. I was going to observe that I think there are many people who lose sight of the extent of the North Sea and German Ocean fishing ground. Many people imagine that the trawlers trawl over the whole ground, whereas, for every 100 acres of ground in the North Sea there is not more than one acre trawled over by the trawlers, so that out of 100 acres of ground in the North Sea and German Ocean 99 are left for the spawning of the fish and to enable them to multiply. When they come to maturity they run to different quarters seeking food. They come to the ground which the fishermen have already trawled over, and they find good food there, and there they will stop and feed and become better in quality. It is at such places that the trawl-fishers find them. If one man has a good catch he tells his friends and they continue to fish the ground until they find it is not sufficient to remunerate them. Then they go to another spot and they will trawl over that for a time without shifting, and probably they will go back to the old spot and find abundant fish again. I believe these facts are lost sight of in supposing that the trawlers destroy any quantity of spawn. In my opinion that supposition is a great mistake.

7111. (*Professor Huxley.*) I wish to know whether the trawl-boats are in the habit of carrying vanes of any particular kind at the mast head?—No.

7112. Are you not aware that they are bound to carry red vanes?—No.

The witness withdrew.

G. Winsor

Gregory Winsor called and examined.

7113. (*Mr. Caird.*) Have you been long connected with the fishing business at Hull?—Yes, for 16 years now.

7114. Are you a native of Hull?—No, I come from Brixham.

7115. Did you move from Brixham to Hull 16 years ago?—No, I came from Brixham to Ramsgate first.

7116. And then you removed from Ramsgate to Hull?—Yes.

7117. Were you then a trawl fisherman?—Yes, I was then about 12 or 14 years of age.

7118. Are you still a trawl fisherman?—No, I have left it for 12 or 14 years.

7119. Have you any property in the trawl-fishing smacks?—Yes. I used to go to Ramsgate in the winter reason.

7120. What was the reason you removed from Brixham to Ramsgate?—I removed because we were nearer to the London market. The land carriage was so great from Brixham; it entailed so heavy an expense upon us.

7121. Did you find as many fish at Ramsgate as at Brixham?—Yes.

7122. But you found greater facilities for getting to market?—Yes.

7123. Could the same facilities be got in coming to Hull?—Yes. We have more markets here to send to. We have found both more fish and more markets to send to.

7124. Before you removed from Ramsgate did the fishing banks off Ramsgate begin to show signs of being fished out?—No, there were still plenty of fish, and I believe there is more fish now than ever there was.

7125. Is there more fish here than at Ramsgate?—I never was fishing off this ground myself.

7126. What ground did you fish, off Hull?—I never went from this place at all.

7127. Then you can only give us information with regard to the fishing off Ramsgate and Brixham?—Yes.

7128. Did you find during that time that the trawl-vessels were increasing or diminishing?—They were increasing a great way.

7129. Were they larger in size?—Yes.

7130. Can you tell us what the increase was?—I cannot say exactly how many.

7131. Were you in the habit of trawling over the same ground repeatedly?—Yes, at Brixham and Ramsgate also.

7132. Had that been carried on for a number of years?—Yes, there were 60 or 70 sail of vessels when I was 12 years of age at Brixham.

7133. Did you not exhaust or impoverish the ground upon which you fished?—Only at certain seasons of the year.

7134. At these seasons would the line fishermen find the same impoverishment?—Yes.

7135. How do you know; have you ever been a long-line fisher?—No, but they could not go out in the winter with their small boats to try. These small boats, which are only seven or eight tons, can only go a few miles from shore.

7136. Did you ever see any spawn in your trawl net?—I never saw any in my life.

7137. Does not the trawl disturb the spawn?—I am sure it does not.

7138. Did you not bring up small fish in the trawl net sometimes?—Yes.

7139–40. What proportion of small fish?—Perhaps a half hundredweight.

7141. Were they bruised or mangled?—They were dead, but they were not bruised, and they were always fit for food.

7142. Were you in the habit of keeping them or of throwing them overboard?—Sometimes we kept them; if we could get them in fresh we could sell them.

7143. Did you notice any kind of fish becoming plentiful or scarce during the time you were engaged in the fishing; take turbot, for instance?—It became more plentiful.

7144. Did you catch more in the latter part of the fishing than when you first began?—More at Ramsgate, and more soles too.

HULL.
G. Winsor.
3 Oct. 1863.

7145–6. How was it with regard to cod?—We don't catch many cod.

7147–9. Did you observe any improvement in the quality of the fish?—I did not notice much improvement in the quality.

7150. Have you ever fished in company with Dutch or French vessels?—Yes.

7151. Off the Dutch coast?—Yes, when I was at Ramsgate.

7152. Are they trawl-vessels?—Yes.

7153–5. Are they increasing in number now?—I cannot say now; they were 16 or 17 years ago. There were a good many new smacks then, and they were a good deal larger.

7156. Were both your boats and their boats fishing on the same ground?—At times; there were always some Dutchmen there.

7157. Is there any celebrated fishing bank on the Dutch coast?—No.

7158. Is there anything like our Dogger Bank or Silver Pits?—No; a great many of their boats come from Ostend. We fish more in deep water.

7159. They did not fish in such deep water as you?—No, sometimes in 23 or 24 fathoms, and sometimes in 18.

7160. Were there plenty of turbot and soles on that ground?—Yes, but there were not many plaice.

7161. Wherever you chose to drag your net, did you find plenty of fish?—Yes.

7162. Did you find that by repeatedly dragging over the same ground you impoverished it?—No; on the contrary, we found that we got more fish.

7163. With reference to a question put to the previous witness with regard to the herring-fishing, do you think it would be a hardship upon trawl-vessels if they were compelled during the herring season to keep their vessels outside the herring shoals?—That would depend upon how far the herring fishers went off the land.

7164. At what distance from the land in trawling do you in general find most fish?—I cannot say; perhaps from 40 to 60 miles.

7165. If, as we are told, the larger shoals of herring are found within six miles of the coast, do you think it would be a serious hardship upon the trawl vessels if, during the period the shoals of herring are in, they should be excluded from coming within a limit of six miles?—I don't think it would hurt the trawl fishermen much to be kept beyond six miles.

7166. Do you take many skate in your trawl?—No, I never caught any skate.

7167. Is there any particular fish you have found falling off in quantity?—No, none.

7168. Have you found any diminution in the quantity of haddocks?—No, none.

7169. If you were told that the haddocks are decreasing on the coast, would your experience lead you to say that was a correct statement?—No, they cannot but have increased. Seven years ago scarcely a basket of haddocks came here; now we get 10 or 12 in a haul.

7170. Has the quantity been increasing every year since the period you mention?—Yes, it has been increasing ever since.

7171. The quantity of haddocks has been increasing?—Yes.

7172–3. Have you as a fisherman ever been able to give aid to vessels in distress at sea?—Yes.

7174. Have you ever fouled any of the long-line fishermen's lines?—I never saw any.

7175. Did you ever carry away any herring-fishing nets?—No.

7176. Have you ever had complaints made against you for destroying their lines or fishing tackle?—No.

7177. Do you catch any shell-fish, crabs or lobsters, in your trawl?—Sometimes we catch some oysters.

7178. Do you get many oysters?—At times we do.

7179. On this coast?—Yes; I have seen the fishermen bring them ashore.

7180. Do trawl-boats generally bring in oysters when they are fishing?—Yes, sometimes.

7181. Are they good in quality?—Yes.

7182. Do they bring them in at all seasons of the year?—No.

7183. If they catch them in the season they are not considered wholesome, what do they do with them?—I cannot say, I have not been out at sea off here myself.

7184. (*Professor Huxley.*) Have you often had large quantities of the fish taken up in the trawl spoilt in consequence of being kept at sea too long by bad weather?—No.

7185. Not at any time?—If there was a gale of wind and we could not get the fish to land, it would be spoilt, and we would throw it overboard.

7186. Have you any reason to know whether any quantity of that spoilt fish gets to market?—No, it is condemned, it never goes to market.

7187. Is it the practice for each fleet of vessels to send one vessel ashore loaded with fish every day?—Yes, every day.

7188. Is it sent in one of the ordinary smacks or do you keep one specially for the purpose?—We don't keep any particular smack.

7189. One smack will take the fish on board from the rest and come in?—Yes, every day.

7190. Is it a common practice to find spawn taken by the trawl?—No, I never saw any.

7191. Have you ever seen any considerable quantity inside the fish?—No.

7192. You heard the last witness state that that occurred sometimes?—Yes, but I never saw any.

7193. Not inside the fish themselves?—No.

7194. Did you hear the regulations with regard to fisheries, laid down in the Act of Parliament, read?—Yes.

7195. Would you like to have them carried out?—I don't know that.

7196. Would it be injurious to your business as a trawler if they were carried out?—I think it would. It would certainly be injurious with regard to the mesh.

7197. Are you a fish salesman now?—Yes.

7198. Have you found any difficulty in getting rid of your fish when there were hooked fish in the market to compete with it?—No; but we don't make so much money.

7199. Suppose there is an equal quantity of trawled fish and hooked fish in the market, does the hooked fish fetch a higher price?—We don't get so much cod as they do, and the rest is a different kind of fish altogether.

7200. Can you get a higher price for the cod you get than they do?—We only get a very few cod.

7201. But you get some constantly?—Yes, but we never sell them by themselves; we put them in a basket with skate, plaice, soles, and other things.

7202. Are the fish you catch here fish which the long-line fishermen don't catch—soles and plaice?—Yes, they can catch them, I believe, but not in great quantities. I never saw them bring any to the market.

7203. (*Mr. Caird.*) Do the French trawl-boats come on your coast among your trawl-boats?—Yes.

7204. In the same way that you go among the French and Dutch trawl-boats on their coast?—Yes.

7205. Is that frequently the case?—Yes, about Ramsgate. I don't know whether they come here or not.

7206. Do the French sell their fish in the English markets?—I cannot say.

7207. Have you ever seen them bought in the English market?—No.

7208. While you have been fishing on the Dutch coast, have you ever taken your fish and sold them in the Dutch market?—No.

7209-10. Do you think it would be of advantage if you were allowed to do so?—No. It would not bring as good a price.

7211. Would you not get as good a price for soles?—No, nor for any other kind of fish; perhaps we might for plaice.

7212. Would it be of advantage if the law was altered to admit you to the French markets, when you get fish off their coast?—No, I think it is better as

it is; they bring no fish here and we carry none there.

7213. You would rather that the law as it stands should be continued?—Yes.

The witness withdrew.

JOHN DALTON called and examined.

J. Dalton.

3 Oct. 1863.

7214. (*Mr. Caird.*) Are you interested in the fishing business here?—I am at Grimsby, where I have both trawl-boats and well-boats.

7215. You have capital employed in the business?—Yes, to a considerable amount.

7216. Are you desirous of offering any observations to the Commissioners?—Yes, I have come to the conclusion myself that the cod boats must be entirely laid on one side, if some alteration does not take place. It has been gradually a losing trade for some years past. The boats I refer to are the smacks we employ in catching the cod on the Dogger Bank. We bring the fish into Grimsby in wells, and it is then forwarded to London for sale.

7217. Are they line-fishing smacks?—Yes, they are large line-fishing decked smacks, but they are very different from the line-fishing boats I have heard of before. I have prepared a statement to show the loss I have sustained by these boats.

7218. Will you be kind enough to read it; we shall be very glad to receive it?—It is a money statement in reference to five smacks which were engaged in fishing in one year. I have, however, taken an average of voyages over two or three years.

7219. Does that paper give an account of the produce of five smacks employed in cod-fishing on the Dogger Bank?—Yes, and a little off this coast.

7220. Are they smacks that have been engaged exclusively in cod-fishing?—Yes, exclusively in cod-fishing. I have taken the produce of the smacks for a couple of years, and I find that each smack has produced a gross sum of 834*l.*

7221. 834*l.* per annum?—Yes, that is the gross produce. Then there are the expenses to come out of that.

7222. Well, go on?—The expense of the working of each of these smacks amounts to 1,073*l.* odd, say 1,070*l.*

7223. Then there has been a loss on each smack?—Yes, I have lost 200*l.* per annum on each.

7224. Have you lost that every year for a period of five years?—No, only during the last two or three years, and of course I must put them by altogether and give up the trade. I cannot afford to carry it on at that rate.

7225. How does that loss arise? Is it in consequence of the quantity of cod you have been in the habit of catching having diminished?—I expect it is so. My impression is that the quantity of cod has been diminishing for several years past prior to my going into the trade. Several gentlemen put some thousands of pounds together and worked the cod trade for three or four years, and they came out of it with a loss of several thousand pounds. If I had known this before, I should not have gone into it. I have a ship yard at Grimsby and these smacks were built there with a view of selling them. Finding that I could not sell them, I worked them.

7226. Then you have gone into a trade which was a losing trade before you entered it?—Yes.

7227. Are you able to tell me whether before that time the boats were catching more cod than during the two years you have been engaged in the trade?—I think they caught more, but I do not know exactly. At one time, a few years ago, it was a paying trade.

7228. Has the price of cod decreased?—I can hardly tell you that; but something has, either the price or the quantity.

7229. The only statement you can make to us regarding the five vessels employed by you is, that you have found it a losing business for the last two years?—Yes, and I have inquired of other people, and I find it was the same with them for several years prior to my entering into the trade.

7230. Has the number of vessels engaged in the cod trade diminished?—They have not diminished, perhaps, but they have not increased. It seems to me that they are altogether stationary. Nobody will buy a cod boat now. I put one up to auction six or nine months ago, and the only offer I got was one of 300*l.*

7231. May not that arise from the fact that trawl-fishing is found more remunerative?—Not at all; but I think it may arise from the fact that the trawl-fishing comes into competition with the line-fishing.

7232. Are you acquainted with any facts in reference to trawl-fishing?—No, only such as this: I have reason to think that with the exception of a very few boats, trawl-fishing here is purely a speculative matter, and that the boats are nearly all mortgaged. Of late there have been several smacks for sale. One was sold about a month or six weeks ago, called the Odin. She was sold by auction for 285*l.* I sent my clerk to the Customs to ascertain the position in which she stood, and I found that she was mortgaged for 650*l.*, and so far from persons of small capital being the persons who lent the money, I found that it was one of our bankers, a man of some consequence. Then there was the Vulture, of 54 tons; she was sold by auction for 280*l.*, and I ascertained that she was mortgaged to the same party for 600*l.*

7233. Were these trawl-boats?—Yes.

7234. Do you know anything of the history of these boats?—Nothing, except that I know they were sold in order to realize the money that had been advanced upon them.

7235. We have heard in the evidence given to us that vessels of 40 or 50 tons are not so well adapted for trawl-fishing as larger boats?—That I cannot tell, but there are persons who can give evidence to the contrary.

7236. You yourself are unable to give us any more facts connected with the subject?—No, beyond this, that I know perfectly well that trawl-fishing is not remunerative. I have been told so by different people engaged in it, and any man who will carefully examine the accounts will come to the same conclusion. I should say that the remunerative nature of trawl-fishing is a mass of simple deception. The facts are easily ascertained; you have only to send to the Custom House and you will find how deeply the trawl vessels are mortgaged. The smack capital here has been estimated at 300,000*l.*, but it is very questionable whether the smacks are worth 100,000*l.*

7237. Are you now comparing the value of the smacks with the result of your own investment?—No, with the result of the absolute sales of boats. That is not a matter of assertion at all; any person may go to the Custom House and inquire for himself and he will find that all the smacks are mortgaged, as a rule.

7238. You stated that nobody is building a cod boat now?—No, nobody would touch them now.

7239. But do you know the fact that persons are building trawl-boats?—I do not think that any new trawl-boats are being built now; I believe that the building is almost stationary.

7240. Is it a fact that no cod boats have been built for some years past?—I would not tie myself down to a single boat or two, but as a general rule that has been the case.

7241. Are you not aware that there has been a considerable increase in the number of trawl-boats?—Yes, the increase of late years has been tremendous. I have been told that the number of trawl-boats in 1854 was only 40; in 1860 it was 143, and in 1862 it was 261.

7242. Does not that fact afford very strong evidence that it is an advantageous business?—I don't think so. People sometimes go wild upon a thing, and that

HULL.

J. Dalton.

3 Oct. 1863.

has been the case here. They are not making anything out of their boats, and one-half of them do not know how they stand with their boats, that is my firm belief.

7243. (*Professor Huxley.*) Is there any large number of cod boats at Grimsby now?—About 40 or 50.

7244. Has the number decreased?—If there are any lost, they are not replaced.

7245. Do you mean that the number is less now than it was 10 years ago?—I cannot say.

7246. Is it about the same?—About the same, but I rather think it has decreased if anything.

7247. I believe you stated that you are a ship builder at Grimsby?—Yes.

7248. Therefore you would know if there had been any marked decrease in the number of boats?—I hardly should; boat building is only an incident in my pursuits.

7249. You think the number has slightly fallen off during the last 10 years?—I think so.

7250. Do you think the loss on each of these cod boats has been similar to the loss you have experienced?—If you will examine the parties themselves they will tell you "no." All I have done has been to show you the result of my experience. I have no doubt that if you question other people, they will say that my account is not correct.

7251. What I want to come at is this; I do not understand how your men of business at Great Grimsby can have been maintaining 40 or 50 cod smacks there during the last 10 years, and losing 200*l.* a year upon each of them?—I don't think there has been that loss. A good cod boat will cost about 1,200*l.* A smack owner will put his boats into a club where they insure them for 500*l.* or 600*l.* But if a man loses his boat he will lose his money, because in all probability the boat is mortgaged, and he never gets another. If you want to insure a cod boat properly, you will have to insure it at six per cent. A smacksman no doubt will tell you that an insurance of 20*l.* will do for that; they have no idea of the manner in which I make up an item of 333*l.* for sundries. If you were to put it to these men and ask them what they would put down for sundries, they would say that 80*l.* or 90*l.* would be enough.

7252. Surely the men who keep cod smacks must know whether they lose money or not by them. If a man loses 200*l.* a year on a vessel he cannot be long in ignorance of the fact?—That is the result of my experience. I have reckoned interest on capital.

7253. Then yours is not a positive loss, but a loss on what you think you ought to have earned?—What I mean to say is, that I am out of pocket by sending these boats to sea.

7254. But if all the other gentlemen who own cod boats are in the same position, they must have an odd idea of trade in Grimsby?—Perhaps they have not lost that actual amount in money. Some of them will run their own insurance, and do a variety of other things to save expense. I myself bought a cod smack two or three years ago; she cost 1,500*l.* or 1,600*l.* building at Sunderland, and she was sold to me for 500*l.* She cost me altogether nearly 700*l.* I ran her two or three years, and after paying for insurance and other matters, I found myself 300*l.* out of pocket. At length I sold her for 600*l.*, and I gave some years for the payment of the money. I was very glad to get quit of her. I am now endeavouring to run my vessels with a less number of men, but if everything is fairly stated and taken into account, I think the sum I have mentioned to you will be found pretty nearly accurate.

7255. How long did you keep your vessels after you began to find that you were losing by them?—I continued to run them in the hope that the trade would mend.

7256. Would it not be cheaper to put them down altogether?—I have been thinking of that long enough, but we always have our hopes that a better time will come. There is a great variation in vessels of this description. One of my vessels made 1,058*l.* in one year, and another only made 766*l.*, so that one naturally goes on in the hope that they will all make 1,058*l.* Nevertheless I have been trying all I can to get quit of them. I have tried to sell them by auction, but without success. If I were to build a cod boat now for 1,200*l.* and were to put her in the market, I should not get 600*l.* for her, fresh from the stocks. I believe if I tried to get 600*l.* for her after I had built her I should not be able to obtain it.

7257. Has that always been the case with regard to cod boats?—For a long time it has been a bad trade, and if you go minutely into a detailed account with regard to these boats, you will find that what I have stated is true.

7258. The fishermen in the cod boats fish with the long-line?—Yes.

7259. Then in your judgment, line-fishing is a bad speculation?—Yes, very bad.

7260. What is the cause of that?—I cannot tell you, further than I imagine that the immense quantity of trawled fish brought into the market must interfere with the price, or it may be that there has been a decrease in the quantity of cod caught. If you had any cod-smack owner before you and were to examine him thoroughly, I am satisfied he would convince you that he does not make anything out of the trade. Perhaps a cod man may go as his own master. He will make 70*l.* a year, or something of that kind by that means. He rests satisfied with that, and he goes on in the hope of better times coming. They are all poor men.

7261. Would you try to prevent poor men from making a little money?—No; and if this Commission would interfere in the matter and put down trawl-fishing it would be their salvation.

7262. How so?—They are ruining themselves at present.

7263. Do you think it would be a fit function for the Government to interfere in order to prevent people from ruining themselves?—I think if I were to break my leg I should be very glad if the Government would step in and mend it for me.

7264. What is the quality of the cod caught here?—The people of Hull don't know what cod is.

7265. The people of Hull don't know what cod is?—That may be an extreme remark, but it is so as a general rule.

7266. Do the people of Grimsby know what cod is?—I suppose they do; it is brought there alive and bought fresh.

7267. You have seen many cod that were not alive brought on shore from cod smacks?—There may be a few that die in the wells, but the remark that I made is perfectly right generally. The fish are brought in alive in the wells and sent to London. The people here never have cod except from the trawl-boats. I have no more to say, but I am satisfied that you will never get a fair statement of things until you investigate people's accounts. At this moment the supply of fish is falling off, and it is increasing in price. All persons in this room who have to go to market and buy fish are aware of that.

The witness withdrew.

J. Gidley.

JOHN GIDLEY called and examined.

7268. (*Mr. Caird.*) Are you connected with the fishing at Grimsby?—Yes.

7269. Are you a fisherman?—Yes.

7270. A cod-fisher?—No, a trawler.

7271. Are you well acquainted with the cod fishermen of Grimsby?—I am acquainted with the owners of the cod smacks.

7272. With the people who follow that business?—Yes.

7273. Is the number of boats employed in deep-

sea cod-fishing increasing or diminishing at Grimsby?—They are increasing.

7274. Do you mean in the line of fishing the last witness referred to?—Yes.

7275. They have wells, and go to the Dogger Bank?—Yes, and the cod owners tell me that they are now doing better than they have done for a long time; that is, they are now earning more money than they have done for a long time.

7276. You have seen the cod boats come to the harbour of Grimsby?—Yes.

7277. Have you had occasion to observe for some years the number of fish brought there?—Yes.

7278. Can you speak of the quantity as compared with what it was a few years ago?—I have been there five years, and I should say that more fish comes into Grimsby now in each smack than was ever brought in before to my knowledge.

7279. More codfish?—Yes; more codfish in number.

7280. Do you know of your own knowledge whether the cod fishing is really a profitable business at Grimsby?—Some people engaged in it get on, and others do not. It is the same in cod-fishing as in all other businesses. I am a salesman in the market, and I have been a fisherman. I am a smack owner. I stop ashore now and sell fish, and I hear them sell theirs, and therefore I acquire a knowledge of all these things.

7281. Do you buy the cod?—No, I do not; I am a salesman.

7282. Being a salesman, are you not also a buyer—No.

7283. Do you sell the trawled fish to buyers who take them into the interior of the country?—Yes.

7284. Have you any business transactions with the cod fishermen there?—No; only the same buyers who buy one fish also buy others.

7285. Have you occasionally any cod in your trawl-boats?—Yes, very often.

7286. How do they sell as compared with the cod caught with the long-line?—Better when they are dead. Our fish are better than theirs when dead. Their dead fish are drowned fish. They have been drowned in the well.

7287. Are they not considered as good as your trawled fish?—No, they are not.

7288. With regard to the live fish, do they bring a much higher price than the trawled cod?—Yes, their live cod will make a great price, but their dead cod, which has all died in the well, is not so good as ours. Ours is a quick death, but theirs is a very lingering one. Our cod die as they are caught.

7289. Does it take the cod boats long to come from the fishing ground to Grimsby?—That must depend upon where they are. The wind may prevent them from coming in quick. They come in when they get a good catch as soon as they can in order to get the fish in alive. They do not wish to have dead fish if they can help it.

7290. Have you yourself fished on the Dogger Bank with the trawl?—Yes, I have.

7291. Have you been near any of the cod-fishing boats you refer to?—No; but I have observed when they got fish the fish was very scarce, and that now there is an abundance.

7292. Are you speaking now as a trawler?—Yes; there are several poor men at Grimsby who are doing very well in cod-fishing. I know a cod man who has done very well indeed, and who has continued year after year to do very well on no capital whatever.

7293. Do you know the number of line-boats at Grimsby?—There are perhaps 50 or 60 altogether; probably you may see 20 come in to-morrow. Sometimes there are 100 in from other places.

7294. But with regard to Grimsby itself there are 50 or 60?—Yes.

7295. What is the tonnage of each boat?—About 70 tons will be the average builder's measurement—somewhere above that.

7296. How long have you known the port of Grimsby?—More than 20 years; I left Hull to go to Grimsby as it was nearer.

7297. Within your experience has the number of line-boats increased or diminished?—The number has increased more than treble since I went there. When I went to Grimsby there were only two gentlemen there. The railway company had a few vessels but they gave them up; having so many agents to pay out again, they found that they could get no money for themselves. But in working a boat yourself you can always get a little profit out of it.

7298. You do not think that the line cod-fishing in these boats has been a losing concern?—It does not appear so. All those who are engaged in it speak in praise of it the same as we do of trawling. They get good times and they get bad times, but they manage to live.

7299. In whose hands are the cod boats; do the skippers own the boats?—Some work them out themselves.

7300. Do the crews own them?—No, they have got owners on shore generally.

7301. Do the boats pay better when they are worked by their own owners than when they are worked for other people?—If their own owners work them right it is a great advantage, but if they do not go and work them properly it is better to let those who will work them. No doubt there is a great advantage in working a boat ourselves. You have always full charge of your own property then, and many an owner would benefit by the exercise of great care if he was there himself to see how things were going on.

7302. You heard the gentleman who was last examined state that he had been losing as much as 200*l.* a year by his boats. Do you think there are any other owners of cod boats in Grimsby who are in the same position?—I don't think there are many who have got that to lose.

7303. Do you think they would be finished up altogether long before they came to that?—Yes, a long time before they came to that.

7304. Are you aware amongst your own acquaintances whether there are persons who wish to give up line-boats in consequence of the injury done to them by the trawlers?—No, we are all friendly together. I am a trawler. I trawl with these cod men. They most of them think we do a benefit to them in stirring up the ground.

7305. Are the line men and the trawlers quite friendly at Grimsby?—Yes, like brothers.

7306. We have not found them like brothers further north?—I have been north, and have been stoned away from there, but at Grimsby we go hand-in-hand together.

7307. Do you work over the same ground?—Yes, we all work together over the same ground.

7308. Have you never heard complaints against the trawlers for carrying away the long-lines?—Not very often.

7309. Does it sometimes happen?—No, I think not.

7310. You have no quarrels about it?—There is not a more peaceable body of people than the liners and the trawlers of Grimsby, and there is not a place in England where they are more numerous together.

7311. Your evidence applies exclusively to the cod fishermen on the Dogger Bank?—We begin 25 miles from Spurn Point, and we fish right away to the Dogger Bank and the Botany Gut.

7312. Do you catch the same kinds of fish that they do?—We catch all that come to the net, and they catch all that come to the hook. They catch most halibut, and halibut is a valuable fish. They very often catch halibut, cod, haddock, skate, and ling.

7313. Then they do not confine themselves exclusively to cod?—No, they take anything they can get, and on the different grounds they will probably get different kinds of fish. Such a thing as a ling is not got at some places, whilst in others they are abundant.

7314. (*Professor Huxley.*) Are you acquainted with line-fishing yourself?—No, I am not.

HULL.

J. Gidley.

3 Oct. 1863.

7315. Do you know the kind of tackle they use in their heavy decked boats?—Yes.

7316. What length of line have they?—At this time of the year they work hand lines over the side of the vessel.

7317. With sinkers?—Yes, just the same as you would do if you went out in a little boat.

7318. How long does the hand-line season last?—It will last about three weeks more.

7319. During the month of October?—Yes.

7320. Do they fish with hand-lines in September?—Yes.

7321. When does the hand-line fishing begin?—Some stick to it longer than others. Some think we had better go further to sea and take our long-lines aboard.

7322. Then with regard to the hand-line fishing, it generally begins somewhere about August?—Yes.

7323. And lasts until the end of October?—Yes.

7324. In that mode of fishing each line is separate, and has a sinker and hook?—Yes.

7325. And the line hangs over the side of the vessel?—Yes.

7326. Does long-line fishing go on during the rest of the year?—The Grimsby people do not go long-lining. There are only certain seasons that they go. They go codding in the summer as far as Faroe and Iceland, and then they come here to take their season catching cod with a salmon and mackerel bait. Now there are plenty to get they catch them.

7327. What time of the year do they set their long-lines?—They begin about the latter part of October.

7328. How long are their lines?—About 40 fathoms each.

7329. How many lines have they?—120.

The witness withdrew.

T. Ramster.

THOMAS RAMSTER called and examined.

7330. (*Mr. Caird.*) Have you long been connected with the fishing trade at Hull?—Yes, for these last 20 years.

7331. Have you, during all that time, been engaged in the business of trawl-fishing?—Yes.

7332. Are you yourself a trawl-fisher?—Yes.

7333. Do you now go to sea with trawl-boats?—No, I have not been to sea these two years.

7334. Going back 20 years, in your recollection, has the number of vessels engaged in the trawl-fishing very much increased?—Yes, very much indeed.

7334. Has it been a good business on the whole to the people engaged in it?—Yes.

7336. Does it continue to be a profitable business?—Yes.

7337. Is the quantity of fish brought to market here and sent into the interior of the country also very much on the increase?—Yes, very much.

7338. Has that been gradual during these 20 years?—Yes.

7339. Has there been any period during that time when it has declined?—There has been a little decrease in some years, but it has come round again.

7340. There has been no marked decline?—No.

7341. No continuous decline?—No.

7342. There may have been an unfavourable season, but it has been followed by a good season?—Yes.

7343. Would you say, comparing the quantity brought into the market now with what it was 20 years ago, that it is much larger now than it was then?—There was a good supply then and there is a good supply now.

7344. Does a boat bring as many fish to the market now as it did then?—Yes.

7345. A single boat?—Yes.

7346. Does it bring more?—Yes.

7347. Are the fish caught now the same kind of fish that were caught formerly?—No, there are larger fish caught now.

7348. Are they better in quality?—Yes, they are better fed fish.

7349. Has any particular kind of fish fallen off in quantity?—None at all.

7350. Do you get as many haddocks now as you did formerly?—Yes, and more.

7351. Are there as many turbot?—Yes. One vessel that was up here last week had 39 turbot in one haul.

7352. Would that have been considered an unusual haul 20 years ago?—No, they were catching quite as many then.

7353. Were they equally good fish?—Yes, they were equally good fish.

7354. Do you find that you get as many soles on the average as you did 20 years ago?—Not so many now, owing to our having had mild winters. The winters used to be more severe then than they are now. If we had a severe winter now there would be as many soles as we ever caught.

7355. How do you account for that?—The coldness of the winter sends the soles into deep water.

7356-8. The soles do not come upon your fishing ground in mild winters?—No, they do not go into deep water.

7359. Do you ever bring up any spawn in your trawl nets?—No, I never saw any in my life.

7360. Is a large proportion of the fish you bring up on deck mangled, or so damaged as to be useless for the market?—I have seen a little damaged if it has been blowing very hard, and we have had to heave our gear up, perhaps half a cwt. or a little more.

7361. Did you ever see as much as half the whole draught mangled and unfit for food?—Never in my life.

7362. Does half the proportion of the whole draught consist of small fish not worth bringing to the market?—No.

7363. Do you always heave over the small fish that are not fit to bring to market?—If we are at sea three weeks or a month we heave it away. Sometimes we drop it on board a vessel that is coming in, in order that it shall not be destroyed.

7364. Is that a large proportion of your whole fishing?—No, it is a very trifling proportion.

7365. Have you ever observed the gall bladder of the fish burst?—No.

7366. Did you ever see such a thing?—No.

7367. Have you seen the scales rubbed off?—They have been rubbed off a little in a heavy gale, but not else. The fish come up as bright as can be.

7368. Did you ever sell any spawn or broken fish for manure?—I never saw any spawn to my knowledge.

7369. Did you ever sell mangled fish for manure?—I have never known such a thing done, unless we have had bad weather, and the fish has been condemned by the inspector.

7370. Is there any regulation as to the size of the meshes of your trawl nets?—Any regulation?

7371. Yes. Does anybody enforce any regulation with regard to the size of the nets?—No; I never heard of such a thing.

7372. Do the fisherman adopt what size they think will be most advantageous?—Yes.

7373. Would it be advantageous to be restricted?—I don't think that it would.

7374. Do you think it better to leave every one to exercise his own discretion?—Yes.

7375. Have you ever fished on the Dutch coast?—Yes.

7376. Do the Dutch use a smaller mesh?—Yes.

7377. Do they catch smaller fish?—Yes.

7378. Is that advantageous to the fishery in general?—I don't know that it is, but such fish would be of no use in our markets.

7379. But they suit their market?—Yes.

7380. Does the taking of those small fish diminish the quantity of fish taken on the fishing ground?—No.

HULL.

T. Ramster.

3 Oct. 1863.

7381. Have you fished much on the Dutch coast?—Yes; long before I came down here.

7382. Do the Dutch fishermen come on our coast?—Yes.

7383. Do you think it would be of advantage to be allowed to sell your fish on the Dutch and French coasts?—No, it would not make any difference.

7384. Would it not be convenient for you to get ashore to the nearest market?—No.

7385. Do you think you would not realize as much as by sending your fish home?—No, not by a good deal.

7386. Then you think it would not be of advantage to allow the Dutchmen and the Frenchmen to sell their fish here, and you to sell yours there?—Not at all.

7387. You think it would be better to allow things to remain as they are at present, each nation keeping to its own market?—Yes. There are a good many Dutchmen who fish off the Dogger Bank in the winter time, and if they were allowed to bring in their fish here they would spoil our market.

7388. Have you trawled on the coast when there have been shoals of herrings around you?—Yes.

7389. Have you ever been foul of herring nets?—Yes, I have been foul of them, but I always try to keep clear of them. It has generally been owing to a stress of weather.

7390. Was it far from the shore?—About 50 miles from the land.

7391. Do the open boats go such a distance from the land?—No, only the decked boats.

7392. You never saw one of the small boats there?—No.

7393. Did you ever trawl so close in-shore as to come in contact with the nets there?—No.

7394. Would it be a hardship to be excluded altogether from coming within six miles of the shore?—No, I think it would do us a great deal of good.

7395. In what way?—It would keep the sea open for the deep-sea fishery.

7396. It would not exclude the herring fishermen from going further out, although it might exclude you from coming further in?—It would exclude us from coming further in.

7397. But it would not exclude them from going further out if they chose to go further out, and take the risk of getting foul with their nets, beyond six miles? If they did, that would be their look-out?—Yes.

7398. Do you think it would be an injury to your boats during the time the herring are on the coast to keep you off six miles?—I think it would do us good to keep us six miles off if they would only give us room in the deep sea. They ought to be prevented from going beyond six miles.

7399. But suppose the limit should only be on you and not on them?—I think it would be a very hard law for one to have it and not the other. It would be very hard to allow them to do what they liked to us, and for us to do nothing at all.

7400. You would rather the matter remained as it is at present?—Yes; unless there was a law to protect us as well as them. I have been putting my gear and nets down many a time where there have been luggers lying close by; as soon as I have put them down they have shot their nets almost alongside. We have asked them many times why they did so, and they say they do it because they catch more fish. The result is that we are forced to get out of the way, or else if we torment them they make us pay for it. Now that is a very bad law for us. If we happen to get foul of them, then they go to law and make us pay for it, notwithstanding that they shot their nets as close to us as they could.

7401. Is it their practice to shoot their nets on the ground you have occupied?—Yes.

7402. And if they do so, is it necessary for you to lift your trawl and change your ground?—Yes, we are forced to go away, or if we do any damage they will enter an action against us and make us pay, notwithstanding that the damage may have been occasioned all through their own doings and neglect.

7403. Do you get any skate in your trawl-nets?—No.

7404. Have you observed whether the quantity is diminishing?—No; it has generally been about the same on an average—sometimes more and sometimes less.

7405. Then you cannot say in your experience of 20 years that you have observed any falling off?—No.

7406. (*Professor Huxley.*) You said you thought it would be very hard if the trawlers were obliged to get out of the way of the drift-net fishermen?—Yes.

7407. Are you not aware that that is the law now?—No.

7408. Did you not hear me read it?—Yes.

7409. Do you think it would be a hard case if that law was enforced now?—Yes, I should.

7409. Because it would oblige you to haul up your trawl and shift your ground wherever you might be, and whatever it might cost you?—Yes; after we have taken up our berth. I have sometimes gone to the masthead in order to ascertain if there was sufficient room for us, and yet they have come alongside and put their nets close to ours. We have been obliged to take our gear up, or else a good deal of damage would have been done.

7410. You have got out of the way because you did not wish to damage their nets, not because you knew of the law?—We got out of the way because we had no wish to injure them.

7411. Would you like to see a regulation established which would keep them as much out of your way as you are obliged to keep out of theirs?—Yes, of course we should.

7412. Are you the owner of a smack?—Yes.

7413. Have you any particular kind of vane at the masthead of your smack?—Yes.

7414. What is it?—A red one.

7416. Do you use it as a matter of your own choice, or because there is a law on the subject?—I do it as a matter of choice.

7417. You spoke just now of an inspector of markets. Is there any person here to prevent bad fish from being sold?—Yes, we have an inspector in Hull.

7418. What are his duties?—To come down and inspect the fish.

7419. Does he see every cargo brought ashore?—I don't know whether he sees all the fish brought ashore, but if the fish is bad, or in any way indifferent, he will condemn it.

7420. Is he what is called the "nuisance inspector" of the port of Hull?—Yes.

7421. He is not a market inspector?—No.

7422. Then if you chanced to keep the fish too long—until it became unfit for food—you could not sell it because you would be stopped by the inspector?—Yes.

7423. Then if the inspector does his duty, it is impossible that any quantity of bad fish can be thrown into the market?—Yes.

7424. How long has an inspector existed here?—I don't know.

7725. Has he been here ever since your time?—Yes, ever since I was here.

7426. Have you ever heard of fish being seized?—Yes, it has been seized at different times, principally owing to the vessels having met with bad weather.

The witness withdrew

HULL.

S. Decent.

3 Oct. 1863.

SAMUEL DECENT called and examined.

7427. (*Mr. Caird.*) Have you been long connected with the fishing business at Hull ?—I have been 20 years here last January.

7428. Are you still engaged in it?—I don't go to sea at present, but I am still connected with it.

7429. When did you leave off going to sea ?—About four years ago.

7430. In what way are you now connected with it ?—I am a smack owner and a fish salesman.

7431. Do you agree with the previous witnesses that there has been an increasing and profitable trade during the 20 years over which your experience extends ?—Yes, it has increased 5 to 1, I should say. The quantity brought here now, in comparison with what was brought then by each boat, is quite equal to that.

7432. The quantity brought by each boat ?—Yes.

7433. Then the quantity of fish has increased as well as the number of boats ?—Yes.

7434. Can you give us the figures ?—No.

7435. What would a boat bring ashore 20 years ago ?—20 years ago we used to heave some of the fish away because we had no markets for it inland, but since the railways have been opened we bring ashore all we catch.

7436. Then it is not so much that you catch more now than you did 20 years ago, but that the demand for fish enables you to bring more ashore ?—The demand for fish is five times as great as it was formerly.

7437. When you say it has increased five times as much, do you mean to say, that where you brought 1 ton ashore 20 years ago you now bring 5 tons ?—Yes, a boat will send five times as much fish away now in the same space of time.

7438. Are you speaking with full consideration of the difference between 5 tons and 1 ton ?—Yes.

7439. Has there been a great change in the price of fish during that time ?—It has not brought so much of late years, but I attribute that to the American war. They have no money inland now to buy fish.

7440. Do you find there has been a decrease in the price within the last 12 months ?—Yes.

7441. Had it increased before ?—It had not decreased ; it was just on a stand.

7442. Then if there is five times the number of fish caught now and the price has not decreased, it ought to be a profitable business ?—The vessels are bigger, and they take more money to keep up.

7443. But on the whole is it an improving and thriving trade ?—I believe it is in general.

7444. Have you observed in your experience whether the quality of the fish you catch is as good as it was twenty years ago?—I think in general we get better fed fish now.

7445. Have you gone over the same ground in trawling and found that the catch did not diminish in quantity ?—Sometimes we may trawl for a blessed week, or a blessed month, and we don't know where we are trawling.

7446. Have you ever brought up any spawn in your net ?—I never knew what spawn in the net was, but I have seen spawn in the haddock.

7447. Is there any particular ground you resort to ?—No ; it is according to the season. One season we go to the Silver Pits, at other times to the Well Bank, or to the off-ground.

7448. Have you confidence that you can get fish on any of the grounds you go to ?—Sometimes we go and do not find anything to answer our expectations. We then make sail again and we chase the fish about a bit until we find them.

7449. You always succeed in finding them ?—Yes, somewhere or other.

7450. Do you agree with the other witnesses as to the increased quantity of fish brought into the market by the trawl-fishers ?—Yes.

7451. (*Professor Huxley.*) You heard me read some rules and regulations just now ?—Yes.

7452. Did you ever hear of them before ?—Yes.

7453. Did you ever feel yourself bound to comply with them ?—No, but we have been compelled by the herring boats.

7454. Which clause ?—The one which requires us to keep three miles off. Sometimes we go and shoot our nets, and we cannot see a bit. They have got no lights up half their time. I believe that the Act states that they shall have two lights, one above the other.

7455. Quite so.—Well, two thirds of the time we can never see them at all, until we see the buoys come up alongside of us, yet by that law they have us under their power.

7456. Had you ever damages recovered against you under that Act ?—No.

7457. With regard to the regulation about the size of the beam, were you aware of that ?—Yes.

7458. Do you feel it necessary to pay any attention to it ?—Some of our beams are shorter.

7459. Did anybody ever examine your beams ?—No.

7460. Did you know the rule about the head irons ?—Yes.

7461. Did ever anybody examine your head irons ?—No.

7462. You spoke of offal fish ?—That is plaice and haddock ; the other we call prime fish, buts and such like.

7463. Does that mean that they are not of the same value as the other fish ?—No, it is just a name we give them. We say we have so many baskets of prime and so many baskets of offal.

7464. We have had it stated in evidence that dead men come up in the trawl occasionally; is that within your experience ?—I have been 30 years trawling, and I never saw a dead man come up in a trawl, and I never saw one in the water.

7465. Have you ever been trawling where the long-line fishers shoot their lines ?—Never.

7466. Has any complaint ever been made against you for carrying away the long-lines ?—Never. I should like to be allowed to make a reference to Mr. Dalton. He has offered to give anybody 10*l.* if they can do away with the trawlers. He has offered to make a present of 10*l.* to anybody who has the power to do away with trawling, and in respect to the two smacks which he stated just now were sold, perhaps everybody in this room don't know where they were built. They were built in a foreign country. They were never of any great value, and that is the reason why they were sold so cheap. Perhaps he don't know where they were built himself.

7467. Do you know a good many smack owners. I mean trawl-smack owners ?—Yes, every one in this town.

7468. Are they satisfied with their trade ?—In general they are.

7469. Are the numbers increasing ?—Yes, we have increased both smack owners and smacks during the last few years.

7470. Are you the owner of more than one ?—Yes, I have two.

7471. If you could get a third would you buy it ?—Not under present circumstances.

7472. Why not ?—Because I should wait until I got a little more capital. If I could get one I should buy it.

7473. You are not losing a couple of hundreds a year by your smacks ?—No, nor do I believe there are many people in Hull who are doing that. If they did I believe there would be many of them "over the left."

7474. Do you believe that the smack owners are steady working traders, or are speculating, in order to get their money by chance ?—There are many masters who will buy smacks, and there are others who get a little capital and take a smack, and then work their way up-hill. Those who have been to sea, sea-going owners, have to work themselves up by degrees.

7475. Do you think it a common case that men who commence life as fishermen save a little money and invest it in smacks ?—If they are steady, they do ; if they are drunkards they do not.

7476. Do you think that a fisherman can save enough money to buy a smack of his own?—Not often, without finding a friend; not in one case out of 50 or 100.

7477. But if he finds a friend, would he be able to redeem the advance made to him, or pay interest upon it?—He would pay interest upon it, and perhaps redeem the advance as well, unless he has a misfortune and loses his boat.

7478. Have you known that occur; have you known a man who began life as a fisherman, who gradually saved a little money, who got a little help, and then invested his capital in a smack, ultimately redeem the amount he had borrowed?—I need only look round this room to see several who commenced life in that way. There is hardly one in the room connected with smacks who did not begin in that way, and perhaps there is not one in the town.

The witness withdrew.

HENRY TOOZES called and examined.

7479. (*Mr. Caird.*) Have you long been connected with the fishing here?—I have been in Hull about 20 years. I have lived here entirely for the last 16 years.

7480. During that time have you been engaged as a fisherman here?—Yes.

7481. Are you still engaged in the fishing business?—I have not been at sea for the last three years. I went apprentice when I was 13 years of age, and I have never been at anything else.

7482. Do you agree with the evidence given as to the increase in the quantity of fish brought to Hull?—Yes.

7483. And also with regard to the profitable character of the business?—Yes.

7484. You have found it so?—Yes. I commenced with a smack of my own. I have two now. I took it, as Mr. Dalton referred to, with a mortgage on it, and I have cleared a great portion of that mortgage off, and as soon as I get the money to get another I shall do the same.

7485. Then, any capital you can make you prefer to invest in the same business, believing it to be profitable?—Yes.

7486. You have continued up to this day to do that?—Yes.

7487. Is there any particular kind of fish that has increased since you have been engaged in the trawl-fishing?—Yes, I think haddocks and plaice have, the haddocks especially.

7488. Have soles increased?—I cannot say that they have not, upon an average; but we have often found soles to be scarce at certain times of the year. In fine weather they resort to rough ground, where the trawlers cannot get at them. Our nets are of a delicate character, and they cannot get across rocky ground. The soles reside there in summer; but in cold weather they resort to deep water for warmth, and then we get great quanties.

7489. Have you ever destroyed spawn in the course of your operations?—I never saw any, except upon opening the fish. We gut haddocks and prepare them for the smokers, and we find spawn in the inside of them, but I never saw any anywhere else.

4490. (*Professor Huxley.*) You mean that you have seen it in the stomach of the haddock?—Yes. I have been trawling from the Land's End to the Coquet Island, and I never saw any spawn taken up in the trawl net.

4791. (*Mr. Caird.*) Do you injure any quantity of fish?—We get a few that have been washed about in the net sometimes, and perhaps we may come athwart a rock, which will push a few about.

7492. Take a month's fishing, will there be any large proportion of that so injured as to be unfit for food?—No; a very small quantity indeed.

7493. Do you bring up large quantities of small immature fish?—Not a great quantity; we may bring up a few.

7494. Have you trawled on the Dutch coast?—Yes.

7495. Do you agree with the previous witnesses, that the quantity caught there has not diminished, although the trawl system has long been pursued there?—I agree with the previous witnesses. I believe there is an increase both in haddock and plaice.

7496. Have you been in a boat trawling on the Dogger Bank?—Yes.

7497. Do you believe that the fish has increased there?—Yes, there has been a large increase.

7498. Are they going on increasing?—Yes.

7499. In what way?—There are more caught by the smacks that go there. There has not been quite so much brought into Hull this last fall as in other years. There has been a great quantity brought from the Dogger Bank, but owing to the distress in the manufacturing districts trade has not been so good. We can get a better price for the fish in the London market than by bringing it to Hull and sending it to the inland districts.

7500. For that reason so much of it does not come to Hull?—No, our own smacks have carried it to London.

7501. Have you noticed any falling off in the quantity of fish caught on the grounds you have been trawling on?—No, there has not been a falling off, but there has been an increase.

7502. In all kinds of fish?—Yes.

7503. How has it been with regard to turbot?—There were never any great quantities of turbot caught off the Dogger Bank, but there are as many caught now and even more than there was 10 years ago.

7504. During the time you have been at sea in a trawl-boat have you ever had the opportunity of rendering assistance to vessels in distress?—Yes, we have saved a crew when we have had only just time to get them from the sinking vessel, and we have hardly got them on board the smack before the vessel has gone down. I got a medal from the Dutch government in regard to the crew of one vessel I saved. The crew must have perished if we had not been there.

7505. Was that in weather during which the small line-fishing boats could not keep the sea?—Yes, they would not be able to get out of harbour; they are sometimes unable to get out of these harbours for a week or a fortnight together.

7506. Do you think the trawl-fishing boats are a better school for seamen than the line-fishing boats?—Yes, a great deal better. There is nothing to learn in a line-fishing boat, but on board a smack a man is learning as much as on a merchant vessel, except reefing topsails or steering by the wheel. These are the only exceptions.

7507. (*Professor Huxley.*) Does that include the heavy line-fishing boats?—Yes, the heavy line-fishing boats have not much rigging about them.

7508. Not so much as in your trawl-boats?—Not so much by a great deal.

7509. What is the rig of your trawl-boats?—Fore-and-aft rig.

7510. Are they cutter rigged?—Yes; the lug-sail boats have not as much rigging about them as there is about our boats.

7511. Are none of the long-line boats cutter rigged?—They are so out of Grimsby, Woolwich, Barking, and Gravesend.

7512. These would take as much knowledge to work?—Yes, we term them smacks. Some of them that have been long-line fishing have been converted into trawlers.

7513. How long does it commonly take to take your trawl on board when you begin to haul it up?—If there is nothing in it but fish it will take about an hour. It will depend much upon the state of the weather.

HULL.

H. Toozes.

3 Oct. 1863.

Sometimes we can get it up in 20 minutes, but at other times it will take us two hours.

7514. Under what circumstances is it that you can take it up in 20 minutes?— When we have fine weather, and commence hauling in slack water, then we soon get the trawl in if there is nothing in it but fish.

7515. If you get the trawl in easily the fish do not get knocked about much?—No.

7516. If it is blowing hard do they get hurt?—They get knocked about a little. The scales are rubbed off, but if there is regular fishing weather few of them are damaged or bruised.

7517. How has the notion got abroad that the trawl-fish are knocked to pieces?—I believe it arises from the prejudices of the Northumberland men, who are anxious to prevent our going to fish there. I was at Hartlepool a few years ago and got my head broke with stones. We had a boat full of fish, but they would not allow us to bring it in.

7518. In what year was that?—It was about 14 years ago last summer. I was there for 11 years successively. It was from the prejudice of the line-fishers that the cry was raised against us. They tried to prevent the smacks coming there because they could not make the money we did. One of our boats would catch as much fish as all the boats about Hartlepool would in a week.

7519. Did your catch of fish tend to throw them out of the market?—It knocked the market down. I have known the fishermen come down when our fish was on the sands and throw it into the water.

7520. Had you no remedy?—None. We have appealed to the mayor of the town, and the men who have done it have come up and apologized and promised not to do it again; but they did it notwithstanding. The authorities of the place told them to get smacks themselves and do the same as we did, but they never have done so. They consider it too hard work.

7521. Have you experienced any hardship in consequence of drift-nets being shot too near you?—Yes.

7522. Do you agree with the other witnesses on that point?—Yes.

7523. Have you found the same inconveniences?—Yes.

7524. Has it occurred more than once?—Yes.

7525. Were you aware, by the regulations you heard me read, that trawl-fishers are bound to keep always three miles from the drift-net fishermen?—Yes.

7526. Do you think it should be carried out?—I don't see it is possible to carry it out. We sometimes put our nets down at night or before daylight when we can see perhaps for eight or 10 miles round. We put our head to westward and tow that way, when all at once a lot of drift nets come up on our side. They have no lights, and we have no warning until we actually see their buoys came up alongside of us. I think the law should be to keep both of us at certain distances.

7527. You would have both the drift-net men and yourselves kept at certain distances?—Yes.

7528. But the herring are often outside, are they not?—Yes.

7529. Then would you keep them away from the shoals?—No. I don't wish to do that. But in case we get foul of each other let each of us pay our own damages. There would not be as many smacks fishing at Hartlepool and Sunderland now if it was not for the herring-fishing being on the off-ground.

7530. Are you aware of the regulations existing with regard to decked and undecked boats, namely, that when decked boats arrive where undecked boats are, or *vice versâ*, then the one shall shoot his nets to the leeward, except they should prefer going to windward, to the distance of half a mile?—No.

7531. Do you think any regulation of that kind would be of service to the decked boats with drift-nets? Supposing a decked boat had her nets down and it was forbidden for undecked boats to shoot within a certain distance of her, or supposing that an undecked boat had her nets down and it was forbidden for a decked boat to shoot within a certain distance, would that be of use in preventing these collisions?—No, I think not, because they come down on each other so much in the night.

7532. You mean that they drift?—Yes.

7533. Would it be of any use if the regulations with respect to lights were enforced; you know that the herring boats are bound to carry their lights?—Yes; but they very seldom get them up. Sometimes they keep them at hand; and if at the boat's edge they can see a smack about half a mile or a mile from them, they pop the lights up. But by that time the nets are alongside the smack, and there is no possibility of clearing them.

7534. Supposing the lights were fixed, would not that prevent a collision?—It would be of some service, but it would not be all that is necessary.

7535. Do you drift with the tide?—Yes, generally.

7536. You don't commonly make much way?—No; two and a half or three miles an hour.

7537. Do you drift faster than the herring boats, or do they drift faster than you?—We drift to leeward faster than they do.

7538. So that if you were windward of them a mile or two you would drift upon them in the course of the night?—We should do so if it was a weather tide. We oftentimes don't go to the windward as fast as the tide is going, and thus the nets come right up under our lee.

7539. You think the best means to prevent a collision would be for the herring boats to be kept within a certain boundary, and for you to be kept outside that boundary?—Yes.

7540. What should be that limit?—The herring boats should not be allowed to come further than 10 miles from the land.

7541. And you should not be allowed to go within 10 miles?—No.

7542. That would not interfere with you on the coast?—It would not interfere with us if we were not allowed to go within 10 miles.

The witness withdrew.

T. Halfyard.

THOMAS HALFYARD called and examined.

7543. (*Mr. Caird.*) Have you long been connected with the fishing business in Hull?—I have been in Hull and Scarborough about 22 years altogether, but I have been living here stationary for about 17 years.

7544. What knowledge have you of the fishing business at Scarborough?—I have not been fishing there for 11 or 12 years.

7545. Is Scarborough a place important in the fishing trade?—It is a little in the summer time, but it is not of much importance to us. We used to go from Ramsgate to Scarborough, and from Scarborough to Ramsgate back again.

7546. Has Scarborough been increasing as a fishing station?—Yes.

7547. Within recent years?—Yes.

7548. Do you agree with the previous witnesses as to the increased quantity of fish brought to Hull by the trawl-boats?—Yes, I think I can give you with regard to my own vessels great satisfaction.

7549. Can you compare the quantity caught now with what it was at any former period?—I know that my four vessels have brought in much larger quantities.

7550. You have four vessels?—Yes, I have three cutters and one other vessel. They have brought to market, one at London on Monday, another on Tuesday, one on Friday, and another to-day here, altogether 500 baskets of fish.

7551. Out of how many vessels was that quantity taken?—Out of six vessels. It was all caught off the Dogger Bank.

7552. Were they all employed there?—Yes, they all joined as partners and they had ice cutters with ice in them to preserve the fish for the markets.

7553. Can you compare that catch with what was caught 10 years ago by the same number of vessels?—No.

7554. Can you compare it with what was caught five years ago?—I only know that we did not get as much five years ago.

7555. Have you ever made in the same time an equal catch with the same number of vessels?—I have at certain times when I have been fishing myself, but it is not the general case when we go on the Dogger. At that time we have occasionally made a whole haul and never seen a sole, now we get 20 or 30 pair at every trawl. One vessel has gone up with 100 beautiful turbot to London this week; another came with 80; another with 40; and another with 30.

7556. Were they all caught off the Dogger Bank?—Yes, and these vessels have brought trunks of soles.

7557. What do you mean by "trunks"?—They are boxes holding about 40 pair.

7558. Have you had a greater number this week than you had on any previous occasion?—I don't recollect such a catch since I have been at sea for the last 30 years.

7559. Is that the case generally with the fishermen of Hull?—It is not generally the case with them because they have not all been there.

7560. Has this been a good fishing season?—Yes.

7561. Not only on the Dogger, but on other parts of the coast?—Yes, in the pits at Well Bank, inside the Dogger, off Scarborough, there have been nice catches of fish, as much as we ever would wish to have. For myself I should not wish to see any more taken than are taken at the present time.

7562. If you caught any more, do you think it would lower the price?—Yes, if they went all on the Dogger catching the same quantity it would be too much for the market.

7563. What kind of fish did these 500 baskets contain?—Mostly haddocks.

7564. Is that what you generally get on the Dogger?—On the softer parts of the bank we get more haddocks, and on the harder parts more plaice.

7565. What kind of fish realizes the highest price per pound weight?—Soles and turbot.

7566. Which kind are bought chiefly by the lower classes?—Haddocks, skate, and plaice.

7567. Is the catch of haddocks increasing?—The haddock is more plentiful than ever. We get in four hours as much as we require at one time of plaice.

7568. What weight would you say is as much as you require at one time?—A ton.

7569. Where does it go to be sold?—It is gutted, packed up, and put into baskets and despatched to the best market.

7570. Do you make choice of the market according to the state of the wind?—Yes, we want quick despatch.

7571. What port do you generally make for?—Hull, because our agents are here, but if the wind is northerly we go to Lowestoft, and if we can't there then we go straight to London.

7572. Do you ever come into contact with the line fishermen on the Dogger?—No.

7573. Nor on the coast here?—No; I never was in collision with a long-liner in my life. Perhaps he may have had a few hooks adrift, but nothing more.

7574. Do you know whether the line fishermen make a good business on the Dogger Bank or not?—No; I have not been to sea for the last few years, but I think they do. One vessel has made 450*l.* lately. That was one of those vessels Mr. Dalton referred to when he spoke of it being a very losing business.

7575. Was it a cod boat?—Yes.

7576. With a well?—Yes.

7577. Do the Dutchmen who come on the Dogger get a great quantity of fish?—Yes.

7578. Do they fish with long-lines?—Yes.

7578*a*. Do they also trawl?—Yes.

7579. How many years have you fished on the Dogger Bank?—I have been fishing on the Dogger Bank about 18 years.

7580. What is the extent of the Dogger Bank?—It is 180 or 200 miles long.

7581. And how broad?—It is 50 or 60 miles broad, or more.

7582. In the period of time you have fished on the Dogger Bank can you say as a fact whether the quantity of fish you can catch has increased, and not diminished?—Yes.

7583. Is the quality of the fish as good as it ever was?—Yes. I intended to put some in a box to bring you. They are beautiful fish with the slime and scales and everything on them. There are turbots and brill in the same state, and although the quantity has been a large catch at a time, yet they came in better order than I have seen for a long time.

7584. What proportion of the fish you catch in the trawl is so mangled that you can't send it to the market?—Sometimes if we get out of our latitude we get a few icers which cut the fish, and perhaps we may get a few stones.

7585. Are you not sometimes prevented from communicating with the land?—Yes.

7586. Does the fish become stale then?—Yes; we will be prevented getting to land by a heavy gale of wind sometimes, and then the fish is wasted, and we heave it away and trawl for more.

7587. Do you get any large proportion of small fish unsuitable to the market?—I never saw a great deal.

7588. From your knowledge of the business you say that you yourself as owner of a trawl, and your neighbours who are also owners, have been making a profitable business of it?—Yes, I have turned my hand to it all my life. I was apprenticed, then became man, then master, and then owner. I began with half a smack, then I got a whole one, and now I have three or four clear of all the world.

7589. If you save any money would you prefer to embark it in this business?—Yes; I have no idea of embarking it in any other business, but I hope I shall be successful enough some day to get out of it altogether.

7590. Are there any improved modes adopted for bringing the fish in good condition to the shore?—We are now fitting up cutters at great expense and stocking them with ice, in order to bring the fish in better condition to the market.

7591. Do they bring a higher price on account of that?—At times they will do, but not in general. It is only when it is bad weather that we want it to keep the fish in good order. In the winter time the fish would make as much money without it as with it.

7592. You principally use the ice in warm weather?—Yes, to keep the fish from getting spoiled.

7593. Do you cure any of the fish on board?—No; they only cure them for their own use.

7594. Would you not find it of advantage to take salt to enable you to cure the fish on board when you find you could not bring it in fresh?—Not as a general thing. If they have any salt on board the men clean a few and salt them for their own families.

7595. Is no part of the shore you are acquainted with becoming unproductive in consequence of overfishing?—No.

7596. Do you know the place that is called "California"?—Yes, I believe I was pretty nearly the first person there.

7597. Do you think that piece of ground will ever recover itself?—I think it would, if these little shore boats that trawl all up from Bridlington Bay would not disturb it.

7598. Do they trawl over that ground?—Yes.

7599. Do you allude to the Bridlington boats?—Yes. As for the destruction of fish by trawling on California, they have been getting as good fish as were ever caught there. With regard to the fish being caught for manure, and having their gall bladders burst, there is not the slightest truth in it. I have often caught bird's eggs in the trawl, which have

HULL.

T. Halfyard.

3 Oct. 1863.

come up among the weeds on California, and they came up without being cracked.

7600. Had the eggs sunk to the bottom?—Yes; they had sunk to the bottom, and we took them up and cooked and ate them. Talk about mangling the fish, why, trawling would not break an egg.

7601. You say you have done that?—Yes.

7602. Have you done it often?—No; not very often.

7603. Does the trawl get entangled with the drift-nets?—Yes; I have become entangled occasionally, and I have cut away my nets because I was afraid of the law. Very often our master has been trawling all night and could not get fish, and when I have asked him the reason he has told me that he could not get his trawl shot for the herring men.

7604. On that occasion, were the herring men far out at sea?—Yes; we could not get clear of them for miles and miles around. Wherever he tried to shoot he found himself entangled with them, and the consequence was that he got no fish.

7605. As the herring fishermen only come for a certain season, would it not be possible for you to fish outside for a certain distance to be fixed, within which you should not fish?—Yes, that might be done; but the herring boats follow the smacks. They think the fish strike into their nets from the smacks.

7606. Do they follow the trawl?—Yes; if it is soft ground the herrings lie on the ground, and they consider when the trawlers come over it that it stirs the herrings so that they come to the edge of the nets.

7607. How far is that from the coast?—40 or 50 miles.

7608. Is a large proportion of the herrings caught at such a distance from the shore?—Yes, I think so; they are got as far as the Dogger.

7609. Do the French boats come among you?—Yes; but we don't like to get foul of them.

7610–1. How is that?—Because we should knock each other's vessels to pieces and sink to the bottom. Their boats are heavier than ours.

7612. They are stronger than you, and you keep clear of them?—It is not for that; it is because we should lose our labour and time.

7613. Have you ever seen assistance given to vessels in distress by trawl fishermen?—Yes, I have seen it myself.

7614. Have you seen lives saved in that way?—Yes.

7615. Have you often seen it?—Yes, often. I had one vessel that saved 23 lives in 14 days.

7616. Is that long since?—No, not very long since.

7617. Do you think that your trawl-boats are good nurseries for seamen?—They are the life-boats of the country. I know that it was only this week that a crew was saved and towed into Newcastle. The vessel had her foremast gone and also her main yard.

7618. Do you get salvage for that?—Yes.

7619. Do many of your crews afterwards become seamen; do they adopt it as a business?—Only a very few of them.

7620. Do they principally remain as fishermen?—Yes.

7621. Probably they find it answers better?—Yes.

7622. Have they any interest in the catch of the boat?—Yes, all go by share.

7623. Are no wages paid?—No, all go by share.

7624. Can any well-conducted fisherman, if he is sober and steady in his habits, generally succeed in realizing sufficient money to buy a vessel for himself?—Yes, generally so.

7625. Are many of the men employed in your fishing vessels part owners of the vessels?—Yes.

7626. Do strangers come here to employ their capital in trawl-fishing?—There may be an instance of that kind, but I do not know of any; I have heard tell of it.

7627. Is it chiefly the families of the fishermen themselves that are increasing; is it in that way the fishermen increase here?—Yes.

7628. Is there any particular kind of fishing you have noticed to be falling off and decreasing in quantity?—I have no recollection of any.

7629. All are as numerous as they were formerly?—Yes.

7630. (*Professor Huxley.*) Has the catch of skate in your trawls fallen off?—No; last winter I saw 20 or 30 skate in one vessel.

7631. The long-line fishermen complain that the skate has fallen off; do you think you catch as many as you ever did?—Yes; last year some tons of skate were brought up here.

7632. Where was that?—Away on the off-ground at the mouth of the Humber. The long-line boats principally catch it.

7633. Are there many long-line boats at the mouth of the Humber?—Yes, they come like we do where they think they can get the best fishing.

7634. What are the birds' eggs you spoke of?—Mur's eggs we call them; they are a large blue egg.

7635. How do they get there?—The birds drop the eggs in trying to get to the land.

7636. Is there much trawling and shrimping going on in the Humber with small trawls?—Yes.

7637. Have you seen it?—I have seen them engaged in trawling, but I don't know much about it.

7638. What kind of net do they use?—They are shrimp nets but they call them trawls.

7639. Do they bring up much small fish?—Yes.

7640. What do they do with it?—They send it to the market. One basket of this fish that they send to the market would make 20 of ours if they were allowed to become full-grown fish.

7641. You mean if they all grew up?—Yes, they would make 20 of ours according to the size we pack.

7642. Do they catch much smaller fish than you do?—Yes.

7643. Do you never get as small fish as they do?—We may get sometimes as small as their biggest.

7644. Do you know what size of mesh they have?—I can't get my little finger in.

7645. Do they catch sprats?—A very few. There are boats for spratting.

7646. Are there any boats of that kind in the Humber?—Yes.

7647. Many of them?—Not many; they go up to Boston Deeps.

7648. How many are there?—I don't know.

7649. Where do they principally work?—Mostly in the River Thames.

7650. Do they catch many sprats in the winter time?—Yes, some hundreds of tons.

7651. Do they catch much small fish?—Yes, of all kinds.

7652. Have you ever seen the fish they catch?—Yes, I have seen it in Billingsgate Market.

7653. Have you ever seen them hauling in the nets?—Yes, I have seen them haul the nets up and have noticed them big in the water like puncheons.

7654. Do you think that does harm to the fish?—I don't know with regard to the sprats, but it does to the small brill and plaice.

7655. Do they catch much brill and plaice?—I have seen hundreds brought to market not bigger than a penny piece. They have been induced not to bring them to the market for fear of being fined for selling them.

7656. Is there any regulation here to prevent that?—I think there must be by that.

7657. What do they do with the small fish?—They generally chuck it away as they catch it.

7658. I suppose in attempting to catch shrimps they must catch these fish?—Yes, they cannot help themselves.

7659. Do you think it is a practice that ought to be stopped?—I don't think that shrimping is as bad as the stow-boats.

7660. Do you think the stow-boats do much harm?

—We used to go on the Foreland abreast of the Kentish Knock. We often fished there; when we got further up between the Knock and the Longstone in 15 and 17 fathoms of water, then we found a great quantity of soles. We used to take them to Harwich. We called it the "iron foundry." We found lots of fish in the summer time there.

7661. But how does catching fish in the stow-boats affect that?—They go right among them and get the small fish.

7662. Have they had much fishing there?—They have made the best fishing this summer that they have made for 17 years.

7663. Then you don't think the stow-boats affect the fishing much?—Apparently not, if we may judge from that.

The witness withdrew.

JOSEPH POTTER called and examined.

7664. (*Mr. Caird.*) Are you connected with the fishing trade here?—Yes, I have been connected with it since I was 11 years old.

7665. Are you a trawl-fisher?—Yes.

7666. Are you engaged in that business?—I am on shore at present; I have been on shore for six months

7667. Have you been a fishermen all your life with the exception of those six months?—Yes, except in the winter.

7668. Do you notice that the quantity of fish you catch in the trawl-boat is increasing or diminishing?—I have found it increasing.

7669. Can you give us any particulars with regard to a season or a month's catch?—Now is the plentiful time for the Dogger Bank. We get most just at this time of the year, in October and November.

7670. Do you refer to any particular ground, or the fishing grounds you have been in the habit of frequenting?—I refer to all grounds.

7671. Can you tell us the quantity of fish you bring ashore now compared with what it was 10 years ago?—We bring more ashore now than we did 10 years ago.

7672. How much would you bring ashore 10 years ago altogether, on an average?—Formerly we did not work the Dogger Bank as we have done of late years. 10 years ago I used to be at Brixham, but during the last eight or nine years, since I have come to reside at Hull, I have begun to work on the Dogger.

7673. Then take the last eight or nine years?—I have found a much greater quantity during the last two or three years than before. It will be three years next month, November, since I noticed the increase.

7674. What would you have taken eight years ago?—At that time if we got 2 tons we thought it a great catch; now we don't consider a Dogger catch under 5 or 6 tons anything of a catch.

7675. You catch 5 or 6 tons in one catch on the Dogger Bank?—Yes.

7676. For what period would you be engaged in getting a catch of 5 or 6 tons of fish?—About 48 hours. We left Grimsby on Sunday morning and on Tuesday evening I was at anchor off Holme lights.

7677. What did you sell them for?—We had 107 baskets, and we sold them for 7*s.* or 8*s.* a basket.

7678. What did they consist of principally?—Principally of plaice, soles, haddock, and turbot; we had about 30 pair of turbot.

7679. When you first began to be a fishermen here, had you a vessel of your own?—No.

7680. Have you one now?—I have two; I started with one, and now I have got another.

7681. Had you any share in a boat when you first started fishing here?—No. I began to serve my apprenticeship from the time I was 11 years of age, and now I have got two boats of my own.

7682. You have been enabled out of your savings to become proprietor of two vessels?—Yes.

7683. Then you have found it a profitable business?—Yes.

7684. Do you find you interfere much with the herring fishers?—I have never caught any of their nets myself, but I have been stopped for some nights through them.

7685. Do you mean by getting foul of them?—I never was foul of them, but I have seen others who have been.

7686. Was that in consequence of the trawlers going upon them, or their coming upon the trawlers?—It was because it was a dark night, and in the morning we found them swimming among us. Then we took up our trawls and got away.

7687. Is it in consequence of your coming to fish nearer in shore that you have come across the herring nets?—No, they have come further off of late years.

7688. Is that because the shoals of herrings go further out?—No, but they find that by coming among us they are enabled to get more herrings.

7689. Do you find that the herring-fishers follow your boats further off to sea on that account?—Yes; they never used to come on our off-ground until within the last six or seven years.

7690. Do you find that the case off the Dogger Bank?—Yes, there are some there now.

7691. Do you fish within six miles of the shore?—No, I was never much off here. I never fished much in-shore; not within 20 miles at any rate.

7692. Then you would not think it a hardship to be prevented coming within six miles of the shore during the period the herring-fishing lasts?—No.

7693. It would not hurt the general body of trawl-fishers?—No, not on the Yorkshire coast, but away down south they fish much nearer the coast.

7694. Where about in the south?—At Brixham, and away down there.

7695. Do they find their fishing near the shore successful?—Yes, eight or nine miles from the shore.

7696. Have you had much experience of Brixham fishing?—I served my time to it from being 11 years of age until I was 21.

7697. How many years do you say?—From the time I was 10 or 11 years old until I was 21, and I used to go for pleasure before I went to sea altogether.

7798. Did you find when you were engaged in the fishing there that the quantity of fish was increasing or diminishing?—There were more takes last year than ever I saw in my life, but we used to go further off for them. We had craft superior to those who fished nearer the shore.

7699. Have the number of fishing boats increased?—Yes, rapidly. When I first came here there were very few vessels.

7700. Did you ever find that you drew up spawn in your trawl nets?—Never to my knowledge. I don't know what it is.

7701. Did you ever find a large quantity of fish so damaged as to be unfit for the market?—At certain times when it has been blowing a heavy gale of wind we have got one or two injured in our nets, but not at any other time.

7702. (*Professor Huxley.*) Do you agree with the previous witnesses that you find spawn in the haddock when you gut them?—Yes, when we are gutting the haddocks now we usually find 20 or 30 baskets of it. I don't know whether it is spawn or not, but we always put it down as herring spawn.

7703. Do you ever get herrings in your trawl?—Yes, sometimes 30 or 40.

7704. Thirty or 40 at one time?—Yes.

7705. Are they full fish with the roe and milt?—Yes, sometimes they are.

7705*a*. Do you think the herring spawn on the Dogger Bank?—I cannot say.

7706. If you get haddocks full of spawn is it not likely that the herring spawn there?—It is in the water, and they may suck it in.

7707. Did you ever see herring spawn so as to know

HULL.

J. Potter.

3 Oct. 1863.

what it was?—No, we say that this is herring spawn.

7708. Do you find it in other fish?—Yes, we find it in turbot and other fish.

7709. Then the turbot eat spawn?—Well, perhaps I am wrong. I never remember seeing it in them.

7710. Did you ever chance to get up any dead bodies in your trawl?—No.

7712. Did you ever hear of anybody who did?—I have heard of it.

7713. Have you known it of your own knowledge?—Yes, I have known smacks bring up dead bodies.

7714. Is it a common thing?—No, out of all the men who trawled last year we only took up one.

7715. Did you hear the regulations read just now?—No.

7716. According to this Convention it is the law that trawl-boats shall not come within three miles of drift-net boats, and that if a trawl-boat is trawling when the drift-boat comes near then the trawler shall haul up his trawl, and get out of the way?—We do that now.

7717. Then it would not be injurious if that law were enforced?—Not on this coast, but it might be further south.

7718. Would it be injurious to you if the drift-boats drifted down upon you when your nets were shot?—But we should not be within six miles of each other.

7719. The Convention says:—"Trawl-boats shall "always keep at a distance of at least three miles "from all boats fishing for herrings or mackerel "with drift-nets," have you ever had that law enforced?—No, I don't know that ever it was enforced.

7720. Do you think it would be a hardship if it were?—We cannot always tell whether they are three miles from us or not. If we see them we get clear of them, but they may get close to us in the night.

7721–2. The practical effect of this article is that they could order you away whether you liked it or not?—Then what is the law for them if they have their nets down all night and day. I have seen their nets down all day and night.

7723. The law simply provides that you shall get out of the way of the herring-fishers. I ask you whether you think it is fair on you that that law should be enforced?—If it was enforced there would be no chance for us at all.

7724. If the law were carried out the drift-boats, whether herring or mackerel, would have a practical monopoly of the fishing ground?—Yes.

7725. You think that would not be fair?—No, I think we ought to have a little fair play as well as them.

The witness withdrew.

J. Hill.

JOHN HILL called and examined.

7726. (*Mr. Caird.*) Are you a fisherman at Hull?—No, at Grimsby.

7727. Have you been long there. I have been there for the last six or seven years. I was born and bred at Barking, and so were my forefathers before me.

7728. Are you a line fisherman?—I follow all kinds of fishing, haddock and cod-fishing and trawling.

7729. Do you you go to sea as a line fisherman now?—Yes, since I left trawling four years ago.

7730. Do you go in those decked boats with wells that we have heard described?—Yes.

7731. Do you fish on the Dogger Bank?—Yes.

7732. How long have you been engaged in the business there?—Six years. I have been at sea for 42 years. I don't go in the winter time now. I go in the summer season, but in the winter time I have stopped at home for the last few years.

7733. Does your boat go to sea in the winter time?—Yes.

7734. Are you the owner of the boat?—Yes.

7735. Have you found, during the last six years, that the quantity of fish you take is increasing or diminishing?—It is increasing more than ever I knew with the hand-line off this coast.

7736. Do you fish only in particular seasons?—I fish at all seasons. We know when the fish shift and we shift after them.

6737. Do you fish along with the trawlers on the same ground?—Yes.

7738. Do you find they interfere with your fishing?—No.

7739. You can get the same amount of fish?—Yes, we go haddocking in the summer time, and we catch them with two hooks with a dip to them. 20 years ago we might go a fortnight or three weeks and not get more than 30 or 40 score of haddocks. Within the last four, or five, or six years we have got five times as many. Before this inquiry came on our men have said, "These "trawl men have done us a deal of good by working "their nets to and fro; they have disturbed the "ground and provided better food for the fish." I have frequently seen food picked up after the trawlers have been over the ground, and we know that if the haddocks don't find the food they will not frequent the ground.

7740. Do you always fish with the same kind of hook and bait?—Yes, we always fished with a small hook and mussel for bait. Lately we cannot find the haddocks unless we can get where the herring spawn is. At this time of the year unless we find certain soil at the bottom we cannot get fish.

7741. Wherever you go do you find plenty of fish now?—This last summer I have been at a particular place known as "East Hole", and this last year I have caught abundance of fish there. I can prove to you that it is not 20 years since there was not a haddock to be caught in that place.

7742. Then practically you find your business improving, particularly in regard to the catch of haddocks?—Yes.

7743. Do you, as a general rule, fish a good distance from the shore?—Yes; 42 miles from here northward is East Hole.

7744. Do you go there in open boats?—No.

7745. Is the ground quite unsuitable for open boats?—Yes, we go to the Well Bank, the lower deep water of the Well Bank, and the upper deep water of the Well Bank, and to Botany Gut. We go there very often.

7746. What kind of bait do you use?—Mussels for haddocks and whelks for cod.

7747. Where do you get it?—From Boston Deeps. I employed a vessel this week to go there for bait. By the permission of the Navigation Company I am allowed to lay them in the water.

7748. Do you ever experience any difficulty in getting a plentiful supply of bait?—No.

7749. Has there been no time when a supply of bait was difficult to be had?—Yes; before this season I have had occasion to go to Yarmouth and send the haddocks away from there, but it has been difficult to get bait there. That is not so here, however.

7750. Do you find this a better place to get your fish ashore?—Yes, it is quite straight across from the Humber.

7751. (*Professor Huxley.*) Do you know most of the cod-smack owners in Great Grimsby?—Yes, every one of them.

7752. Do you think most of them are losing money?—I hope not.

7753. Did ever any of them lose as much as 200*l.* upon a boat?—Yes, I lost more than 200*l.* in one year myself; I lost 500*l.*, but it was in consequence of a misfortune.

7754. How was that?—A vessel ran into my boat and ran her down.

7755. You did not lose that sum by fishing?—No.

7756. By working steadily you have recovered that

misfortune?—I always found means to keep my vessel going and to keep my family decent.

7757. From your knowledge of the other smack owners have they been enabled to do the same?—Yes, people who have been brought up to it. People who may not have been acquainted with it may not have done as well.

7758. Do you think this is a kind of business in which people who don't know much about it are apt to burn their fingers if they engage in it?—I should think so; I think they have found it so. I should fancy if I entered into anyone's business and knew nothing about it, I should do very little better myself. I hardly think I should know how to manage it.

7759. I understood you to say that the haddock feed on herring spawn?—I have seen vessels lie down where the spawn was supposed to be, and not leave the place because they knew the fish would come there. They have caught haddocks with their inside full and their gills full of spawn; but nevertheless they will accept the mussels.

7760. Do you think that every haddock you catch is one less to eat spawn?—Yes, I think so.

7761. Then you think you are doing good to the spawn rather than injury?—Yes, at this time of the year.

7762. Where do they spawn?—On the rough ground; if there is sandy ground then there is no haddock.

7763. What kind of food do they find on the ground?—There is always a kind of rough at the bottom. Sometimes we haul up stones with things all alive on them. I think that the ground being disturbed by the trawling vessels has given us leagues of ground to fish on where we had only miles before.

7764. In your experience of the haddock-fishing are the haddocks as big as they used to be?—Quite as big. On the Dogger they are much larger.

7765. Have you been fishing on the Dogger?—Yes.

7766. Do you fish with the long-line as well as with the hand-line?—Yes, my vessel does in the winter time.

7767. Do you fish upon the same ground the trawlers fish upon?—Yes.

7768. Do they carry away your long-lines?—If a trawler comes across the buoy it will carry it away.

7769. Do you think the trawling and long-line fishing can go on together?—I am satisfied that they can because I have seen them.

7770. Have you been fishing with the long-line and sustained any damage?—I never suffered any injury unless the trawlers happened to come athwart our buoys. In that case they might carry them away.

7771. Would not the ground rope of the trawl catch the anchor?—It might catch the hook and break the snood, but not the line; the snood is much smaller than the line itself.

7772. Would it not pull up the whole affair?—No, I have seen it repeatedly, and I should never haul up my lines for a trawler; I never did.

7773. Then in your judgment the two modes of fishing can go on together?—They do so at present. Occasionally they bring up a buoy, but they bring them to us again. Our names are all upon them, and they will come to me and say, "Mr. Hill, I have got a buoy "of yours," and of course I take it from them.

7774. No damage is done by them that seriously injures you?—I have not lost five shillings nor five pence either since I have been fishing in consequence of the trawlers.

7775. On what kind of ground do the haddocks swim?—The rougher the ground the more haddocks you will find.

7776. How do the trawlers contrive to work over the rough ground?—They have caused the haddocks to come there. We work at Botany and the Great Silver Pits where there is deep water. We lay in 24 fathoms of water and on the edge of the ground; if they trawl their nets they trawl them into shoal water. They make good fishing-ground for 50 sail of vessels if they have the wish to go.

7777. Is that the usual depth of water in which you fish?—Yes, from 20 fathoms; we go into nothing less than 19.

7778. Do you catch much cod?—One now and then by chance.

7779. Do you go out on purpose to catch cod?—Yes, in the winter time.

7780. With the hand-line or the long-lines?—The long-lines; the hand-lines only last about three weeks longer from now.

7781. Do you find the cod as plentiful as it used to be?—There has been more this season than ever I knew before.

7782. Are they as fine fish?—Yes.

7783. Then can you account for the fact that the in-shore fishermen cannot find any?—No, unless they are always trying over one piece of ground. If we go with our lines and don't find any fish, then we go and try another spot, and keep trying until we do find them.

7784. Are you ever inconvenienced in your fishing by the drift-net men?—I have been in former times, but not of late years. I have been foul of their nets, and they have been foul of mine.

7785. Was that in long-line fishing?—No, in trawling. If a herring man gets hold of my gear it is done for; they take it away with them. Drifting along, they are lying dormant as it were with the nets with no sail up, and if they get hold of our lines they will drive along with the whole lot, and take them all away.

7786. Have you ever lost lines in that way?—Yes.

The witness withdrew.

JOHN TIMS called and examined.

7787. (*Mr. Caird.*) Are you a trawl-fisher?—Yes, a smack owner.

7788. Have you been long engaged in that business at Hull?—For 18 years.

7789. How long is it since you became a smack owner?—Six years since.

7790. Had you previous to that been a fisherman on board a trawl-vessel?—Yes, I had been a fisherman on board a trawl-vessel.

7791. Did you save as much money as enabled you to become the owner of a vessel?—I saved part, and borrowed part.

7792. And so you gradually became an owner instead of remaining a fisherman?—Yes; that is what we may term "going in at the hawse hole, and coming out at the taffrail."

7793. You have not found any difficulty in getting over the taffrail?—I managed it at last.

7794. Is the business improving?—I have found it so.

7795. Can you give us any figures to show us the quantity of fish you used to catch, and the quantity you catch now?—I have no figures, but I can say from my experience that during the last two or three years the fishing has been much better than formerly.

7796. Does that apply to all the different kinds of fish you are in the habit of catching?—Yes, all kinds.

7797. Do you agree with the previous witnesses that the supply of fish is considerably increasing?—It is increasing considerably. I have been trawling at Plymouth, and have been going over the same piece of ground from the month of May to the latter end of November; I have seen 60 or 70 vessels trawling over the same piece of ground, which is only a mile and a half wide. In the first part of the season we catch very little fish, but in the latter part we catch far more than when we began.

HULL.

J. Tims.

3 Oct. 1868.

7798. Is that the case here also?—Yes.

7799. Is there no ground here to which you can refer, over which you have not trawled with continued success?—I know of none particularly; they are all good here.

7800. Are they all increasing in productiveness?—Yes.

7801. Have you fished much off the Dogger Bank?—Yes, there are more fish there now than ever there were.

7802. More than ever there were?—Yes.

7803. Is this the best time for fishing, then?—There are different seasons; at some seasons there are few fish there; in May, for instance, we catch very few then, but in the fall of the year we catch plenty of fish.

7804. Do you find you sometimes get foul of the herring-net fishermen?—We have got foul of them, and we have to get clear of them as we best can.

7805. Do you generally fish outside of them?—We should be puzzled to get outside of them; if we went 100 miles they would follow us.

7806. Why do they do that?—They say we stir the fish up for them. I have been out for a long distance, and there lay the herring boats all ready to berth themselves as soon as our nets were down; they would come after us.

7807. What did you do then?—We hove our trawl up and got out of the way.

7808. Do you agree generally with the previous witnesses that the supply of fish in Hull has very greatly increased?—Yes, it has very greatly increased.

7809. And that at present it is still a flourishing business?—Yes, to those who have the mind to look after it; no business will look after itself.

7810. (*Professor Huxley.*) You think if it is well looked after it will pay?—Yes.

The witness withdrew.

H. Cousins.

HENRY COUSINS called and examined.

7810*a*. (*Mr. Caird.*) Are you a fisherman here?—Yes.

7811. Have you been long engaged as a fisherman here?—About 24 years.

7812. As a trawl fisherman?—Yes.

7813. Do you agree with the previous witnesses as to the increase in the quantity of fish brought ashore here by the trawl-boats?—Yes.

7814. In your experience have all kinds of fish increased in quantity?—Yes, I believe they have.

7815. Has the quality improved?—It has improved in quality as well.

7816. Do you know in your experience any line fishermen who ever became trawl fishermen?—I don't know that ever I did.

7817. The line fishermen have been in the habit of being line fishermen, and have not changed their mode of fishing, and become trawlers?—I don't know that I ever heard of such a case.

7818. Do ever the trawl fishermen become line fishermen?—No, I think not. They shift about sometimes about Grimsby, and sometimes they go lining, and sometimes they go trawling.

7819–20. The same men?—Yes; they shift about from vessel to vessel.

7821. (*Professor Huxley.*) Have you been in the habit of long-line fishing yourself?—Not at all.

7822. You have been confined entirely to the trawl?—Yes.

7823. Did you ever find that the fish got by the long-line came into competition with your trawled fish?—No.

7824. Did you hear the regulations which I read some time ago?—Yes.

7825. Did you know that there were such regulations in existence?—Yes.

7826–7. Have you ever known in your experience anyone come to interfere with you, to find out whether you obeyed these regulations or not?—No.

7828. You have always done much as you liked?—Yes.

The witness withdrew.

R. T. Vivian.

RICHARD THOMAS VIVIAN called and examined.

7829. (*Mr. Caird.*) Mr. Vivian, you are connected with the fishing business at Hull, I believe?—Yes.

7830. Are you an owner of fishing vessels?—Yes.

7831. Have you at all been at sea engaged in trawl-fishing?—No; I have been out on two occasions for very short periods for my own pleasure, but I did not remain long enough to make me acquainted with the system.

7832. How long have you been the owner of trawl-vessels?—For three years I have been connected with the business, but for 15 years my father was owner of several vessels, and I carried on his business for him. I have been a fish salesman during that time.

7833. Then you have had 15 years' experience in Hull in connexion with the fishing trade?—Yes.

7834. In the course of those 15 years has the supply of fish increased or diminished?—I believe it has greatly increased.

7835. Can you tell us the extent to which it has increased?—No. It would be very difficult to get at anything like correct statistics as to the amount of the fish at any given place, because during certain seasons of the year, in consequence of the fluctuations of the market, it is considered better to send it to one market than to another. For instance, it may be thought best to send to the London market at one time, while at other times they think it better to take the fish to Hull. Therefore a great number of Hull vessels may go to London without the fish passing through Hull at all. That has been the case during the last two years, so that no statistics obtained here would give a correct estimate of the quantity of fish caught by the Hull vessels, inasmuch as a great portion is taken by the London cutters to London, and for the last 12 months by the Hull cutters as well.

7836. Do you think the quantity of fish brought into Hull has increased or diminished during the last 15 years?—Do you mean independent of that which is taken to other markets?

7837. Yes, independent of what goes to other markets.—Yes, I should say so, independent of the quantity which goes to London and which is caught by Hull vessels.

7838. Do you think each vessel has as good a catch of fish as it had 15 years ago?—Yes.

7839. Do you think it has a larger catch now?—Yes.

7840. From any knowledge of your own can you tell us the difference in the catch now, compared with what it was 15 years ago?—No, but I know there have been much larger catches off the Dogger Bank latterly than formerly. Vessels have been bringing 60, 70, or 100 baskets of fish at every catch. Such catches were very unusual 14 or 15 years ago.

7841. Do you know as a matter of fact whether any spawn is ever destroyed by the trawl net?—No, I don't. I have made considerable inquiries among the fishermen, as I know the whole of them. I think I must have inquired of scores, perhaps several hundreds of them, and they are all unanimous in their testimony with regard to spawn. They all say that they never saw it taken up in the net.

7842. Is it a fact that a good many of the south country fishermen come north?—Yes.

7843. Is that in consequence of the failure of their own fishing ground?—No, I think not.

7844. Then what is it caused by?—Adventurous men pushing out and finding other fishing grounds, others have been induced to follow them. Perhaps the grounds here are more productive than the ones they were in the habit of fishing, and that may have led to the migration—such migration not being occasioned by any falling off in their own grounds. I know that such has been the case at Hull. I know that some time ago some men went down to the Silver Pits, and there they found an enormous quantity of soles, which caused almost a total migration from Ramsgate to Hull, but the fish remaining at Ramsgate have considerably increased since then; so that I imagine there are as many trawlers there as there were 15 or 16 years ago.

7845. Have those immense takes at the Silver Pits continued to go on?—They have at different seasons. Sometimes there has been a great abundance of fish in heavy cold weather, but during a mild open winter I have not found such large quantities brought by the boats.

7846. Do you know whether there is a large quantity brought for the consumption of the poorer classes?—Yes, a great deal.

7847. What kind of fish does it consist of principally?—Plaice and haddocks generally.

7848. Has the price of that kind of fish increased?—I think not.

7849. Would that kind of fish have been supplied by the line fishermen in such quantity if it had not been supplied by the trawl fishermen?—I think not. We find a greater demand for that kind of fish. We sell all that kind of poor fish, whereas formerly we should not have brought it ashore. We had to make regulations as to the number of baskets to be brought ashore, nine or 10 years ago. For several years we had arranged among ourselves that the vessels were only to send away 10 baskets of that offal kind of fish every morning.

7850. What was done with the rest?—It was thrown overboard; we could not find a market for it that would remunerate us.

7851. When did you cease to have that regulation?—If my memory serves me rightly we have not had such a regulation for the last six or seven years.

7852. All that is caught now is brought ashore?—Yes; it is partly owing to the railway companies having reduced their rates of charges, and more particularly in consequence of the fish having been pushed out into other markets.

7853. Does the Hull market largely supply the other great towns with fish?—Yes.

7854. What markets do you principally supply?—All the principal places in England are supplied from Hull. Perhaps the greatest proportion of the fish sent away goes to London, Manchester, Liverpool, Leeds, Birmingham, Bristol, Bath, and even Glasgow and Edinburgh.

7855. How many tons may be sent away in a day?—Sometimes during the winter season from 60 to 70 tons.

7856. Can you give us any idea of the proportions of the different kinds of fish that are despatched in that quantity?—The haddocks and plaice form the largest proportion; they will be in about equal proportions. The soles perhaps would out of 100 parts represent one twentieth or perhaps one fifteenth.

7857. (*Professor Huxley.*) That would be six parts of the hundred?—Yes.

7858–9. (*Mr. Caird.*) Will you give us the proportion with regard to the other fish?—Turbot and brill would perhaps represent a fifth part. Turbot, brill, and soles are the prime fish. Then we have plaice and haddocks, and other kinds of fish—cod, ling, and skate. All those descriptions we catch in greater or lesser abundance at times, but we don't consider them a staple article.

7860. Do soles, turbot, and brill bring the highest price?—Yes.

7861. Are haddocks and plaice principally used by the poorer people?—Yes.

7862. What proportion of the 100 tons would be haddocks and plaice?—Five sixths of it.

7863. Five sixths of the whole?—Yes.

7864. Then a very large proportion is of that description?—Yes, a large proportion is of the commoner kind of fish.

7865–6. Has the price of that fish been much increased, or has it been stationary?—On an average of 10 years I think it is about the same. I think it will be difficult to give anything like figures in connexion with fish. On some occasions, according to the ground over which they have been fishing, there will be an equal proportion of soles and of offal fish, but on other grounds it will be as I have stated. It is so very irregular, in consequence of the variation of the grounds on which they fish, and also in the fish which frequent them.

7867. Do you apply the term "offal fish" because they bring a lower price?—I don't know the origin of the term. It was used before I came into the business. All are called "offal fish" except the soles, turbot, and brill.

7868. Offal fish is always got in larger proportion than other fish?—Yes.

7869. Probably that is the reason of its lower price?—Yes, perhaps it was literally offal fish when they first caught it, because they had to throw it away. If they could not send away their fish as they do now, and bring it every morning to land, they would not send any at all except turbot, soles, and brill.

7870. (*Professor Huxley.*) From your knowledge of the fishermen here, Mr. Vivian, as a proprietor of smacks, do you consider the business is one that is answering?—Yes.

7871. You are not of opinion, then, that the increase in the number of the smacks is owing to mere speculation, or recklessly running into a business that will not pay?—No. It does occur sometimes that in extraordinary seasons you will find a greater flush of vessels. It has been the case in prosperous seasons that persons have been induced to enter the business without sufficient knowledge to enable them to carry it on; and although it might be profitable then, yet when the fishing returned to its average they would find it unremunerative, because they would not be able to attend to it themselves.

7872. But that happens in any business?—Yes.

7873. In your judgment of the business of trawling, are you enabled to say that it is a thriving trade like anything else?—Yes.

7874. Have you been at all in the habit of buying hooked fish?—No.

7875. Is there any considerable difference in the quality of hooked fish, compared with trawled fish?—I don't know that there is.

7876. Is there any difference in the price given in the market for the one as compared with the other?—The hooked men don't supply the same fish as we do.

7877. They catch turbot on the hook sometimes?—But they don't supply the market with it.

7878. You don't catch cod in any quantity?—No.

7879. How then do you interfere with the markets of each other; the long-line men catch haddocks extensively, do they not?—Yes.

7880. Do they get a better price for them than your trawled haddocks?—No. I have had them here, and I find they don't fetch as much as ours.

7881. Then as to cod-fishing, you don't think the trawl-fishing interferes with the long-line fishing?—No.

7882. But in the haddock-fishing it does?—Yes.

7883. Then with regard to the haddocks the competition must tend to lower the markets?—Yes.

7884. They get a less price than they would do?—Yes, certainly.

7885. Is there any other kind of fish in which you compete with each other?—With the exception of haddocks, the fish in which we could compete is caught in such small quantities that it could have no effect on the market. I speak of such fish as cod, skate, and ling.

HULL.

R. T. Vivian.

3 Oct. 1863.

7886. Do you catch halibut?—Yes, occasionally; but I have not seen one in Hull for a month or two.

7887. Do you know that there is a great outcry on the part of the line fishermen on account of the damage done to them by the trawl fishermen?—I have heard no complaints except by the Northumberland and Durham fishermen. The cause of their complaint is evident. Our vessels go into their markets and take beautiful fish, and that cheapens the whole supply.

7888. But that would apply chiefly to the haddock. If you don't catch a supply of cod how can you interfere with them?—We take a supply of soles, and probably the people who would otherwise eat cod will eat soles. If they only had the cod they would have no choice; they would take them at almost any price the line fishermen chose to ask for them.

7889. I believe you have paid attention to this subject?—Yes.

7890. This pamphlet I hold in my hand is yours, is it not?—Yes, it is my compilation.

7891. Do you know anything of the operations of the line cod-boats?—I know there are such boats in existence, but I have never been on board of them.

7892. Do you buy fish of them?—No.

7893. You hinted just now that within the last year cutters have been fitted up in Hull to carry the fish to London?—Yes.

7894. Do you find that better than sending it by railroad?—The more direct they take it from the sea to Billingsgate the better. The cutter is provided with eight or 10 tons of ice, and the fish are caught, gutted, and packed up in ice, and the cargo taken to London in better condition than if brought on shore and placed in railway vans.

7895. What is the size of the cutters employed in that way?—Those we have at present are only of the ordinary size, but our vessels have increased so much in size that many of them are adapted for cutter purposes. As a class they are fine splendid vessels, fit to go to any part of the world. When it was first determined to carry out this purpose the smack owners met together and offered certain vessels. We thought that 20 would do the work and 20 were decided upon to be fitted up as cutters. They were fitted up, and we agreed that the whole of the carrying should be done by them. It was necessary that we should have a stipulated number because the fitting up is attended with great expense. The ice has always been extremely dear, and we were in a manner forced to continue the vessels fitted up for the work after they were engaged in it.

7896. Do you send much fish by railway?—Yes, but there has been a great decline since we used the cutters. They take nearly all the fish that goes to London. Perhaps a man will say "Here is all the "day's fish going to London; it will be better if I "run my fish into Hull." Sometimes there is a gale of wind which scatters the vessels, and they can't find the cutters. The cutters then take what fish they can from the boats in sight and bring it away.

7897. How long will a stock of ice hold out and keep the fish?—It will keep it for a week.

7898. Is there any danger of losing the cargo from contrary winds?—No.

7899. How long does a cutter take to get from the fishing ground to London?—From three to five days, but it is not often so long as five.

7900. Probably if they had a south-westerly wind they might take any time they liked?—No, they can beat up against it anywhere. Five or six days is a very extraordinary and a very exceptional case.

7901. If you don't get a very heavy sea and the wind is off the shore it will be against you?—Probably so, but from my experience here whenever there is any stress of weather they are enabled to get in quite as soon as they are expected.

7902. (*Mr. Caird.*) How would they do in calm weather?—They could not get on then, but calm weather would not last so very long, and if they got anywhere near the mouth of the Humber there are steamboats in attendance to tow them right up.

7903. (*Professor Huxley.*) Would it not pay to have steamboats to carry them in?—No, there are several objections to that.

7904. What are they?—There would be great difficulty in preserving ice on board a steam boat. Unless it were a very large vessel the ice would melt away. To keep the ice room and the fish in the ice far enough from the boilers would require a large vessel, and also a regular supply of vessels. Of course the building of 20 large steamboats to take the place of our large cutters would be quite impracticable.

7905. Do you think it would be in any way possible to supply the market with the fish you now supply provided that trawling were stopped?—No, I do not.

7906. Do you think it practicable that the long-line fishermen could supply the markets?—No.

7907. Not if the number increased along the coast?—No, all the fish they supply would be of one character; they could not by any means supply the markets with sole or plaice.

7908. The demand for soles in London is very great, is it not?—Yes, it is more eaten in London than any other fish. I should say take it altogether it is the fish held in the highest estimation by the greatest number of persons.

7909. If trawling was done away with that supply of soles would be practically abolished?—Yes; there never was any large public market supplied by the long-line fishermen. For practical purposes it is impossible to catch soles by the long-line.

7910. One witness stated to us that there is an officer in Hull who acts as inspector of fish?—Yes.

7911. Do you find that system works well; is it a good regulation?—Yes.

7912. Otherwise would bad fish be thrown into the market?—Yes, no doubt.

7913. Is it practicable to make that inspection so efficient that no considerable quantity of bad fish can ever be thrown into the market?—Yes, I think so.

7914. What is the penalty for attempting to pass bad fish?—I think it is 10*l.*

7915. Has the inspector of the market any control over small fish?—I have never seen him exercising any such control.

7916. One witness stated that great quantities of small turbot used to be caught by the stow-boats, and are occasionally caught yet. Would the inspector have a right to challenge them?—I don't know.

7917. Do you think that his right only extends to bad fish?—I think so.

7918. Are you of opinion that the stow-boats do any harm to the fishing here about?—I don't find any perceptible difference in the supply of the fish, but it is reasonable to suppose that the catching of immense quantities of small immature fish—small turbot, brill, and soles, only the size of a penny piece, will be injurious, although we have not yet felt the effects of it.

7919. How long has that mode of fishing gone on here?—It is not so much practised in the Humber as in the Thames.

7920. But your small shrimp nets are worked pretty actively, are they not?—Do you mean here?

7921. Yes, do they not catch a good many small fish?—Yes.

7922. What do the small boats do with the small fish they catch?—I believe they throw it overboard.

7923. May not large quantities of it be thrown overboard alive?—Possibly.

7924. Is there anything like whitebait in the Humber?—Whitebait?

7925. You know the fish, I suppose?—Yes, I know the fish they catch in the Thames. We don't get it here.

7926. Do you get sprats in the Humber?—They are mostly got at Boston Deeps.

7927. Is there a good deal of other young fish mixed up with the sprats?—I don't know that there is a great quantity, and I can't say whether they select it out and throw it overboard.

7928. You have not noticed that it has had a bad effect on the supply of fish outside?—No; I don't

HULL.

R. T. Vivian.

3 Oct. 1863.

know whether the trawl-boats that trawl in-shore feel the effects of it, but at any rate it does not disturb the deep-sea fishing.

7929. What do you mean by boats that trawl in-shore?—I mean the Bridlington Bay boats.

7930. They are quite small boats, are they not?—Yes.

7931. Do they do any harm to the fisheries?—They catch the same description of fish that we catch, but their general take is of a smaller character.

7932. Is their sale of fish principally local?—We have occasionally a few fish coming from Bridlington, which we send to Manchester; although small they are excellent fish.

7932*a*. What is the size?—They are about the size of your hand.

7933. Do the poor buy them largely?—I suppose so.

7934. Have you any suggestions which, from your study of this question, you wish to make to us?—One fact that has always struck me with regard to the immense quantities of fish is this: our vessels fish in fleets of from 70 to 150 in number on ground suitable for the whole of them to fish on when the weather is favourable. It is a remarkable fact that morning after morning, as they take their trawls on board, each boat gets pretty nearly the same quantity of fish. That shows that there is about an equal layer of fish over the whole ground, which is many miles in extent. It seems to prove that the fish must be there in great abundance when we find that the same boats have the same quantity of fish every morning. Any little irregularities that occur are generally easily accounted for by negligence in the use of the net or in the appliances brought to bear on the fishing. As a rule a large piece of ground trawled over by perhaps 100 sail of trawlers seems so equally spread over with fish that every one of the vessels gets an equal quantity.

7935. Does that take place day after day?—Yes. With regard to irregularity in the catch, I have been assured by fishermen who have been trawling one after the other, so that it would appear that the nets of the second vessel had gone over exactly the same ground that those of the first vessel had gone over, that when the last net was hove up it would have exactly the same quantity of fish in it as the net of the vessels that preceded it.

7936–7. Where is the place to which you refer?—Down in Rye Bay. It is a piece of ground adapted for fishing, which is very narrow. Fishermen tell me that they have had as many as seven or eight boats following each other, and it is often the case that the last vessel will have as much as the first. In talking to the fishermen on this subject they have instanced that as a fact. I have stated to them how extraordinary it is that with such a large number of vessels they should have an equal quantity, and then they have instanced the case of the fishing in Rye Bay to me.

7938. Does the supply of fish by the trawlers keep tolerably steady, or is it a fluctuating supply?—It is regulated by the seasons; in cold weather there is an increased supply of soles; in other seasons we find no lack of fish, but there is very often unfavourable weather for taking it. When we have open winters we have windy weather; when the winter is intensely cold we have not such heavy winds.

7939. Does it ever happen that you are ever a week without a supply of fish from your trawlers?—We have been nearly that time at some periods, but it has been very rarely a week that we have been without.

7940. Do you think the destruction of fish would be as great if the fishing was confined to line-fishing?—We think our vessels catch fish which the line-fishers don't attempt to catch.

7941. For what reason?—I don't think they could catch it if they were inclined.

7942. Is that in consequence of their vessels not being so well furnished?—They cannot keep the line steady enough.

7943. Suppose you fitted up one of your smacks for line-fishing, either with the hand or long lines, would she catch as much fish as the trawler, taking the whole year round?—No, I think not.

7944. Why not?—It is difficult to arrive at conclusions about that, because the difference in the fish they catch is so great that it is next to impossible to form an estimate. But I should say that a considerably greater number of tons of fish are caught by the trawler than by the liner.

7945. (*Mr. Caird.*) How many tons of fish do you generally send packed up in ice in one of the cutters?—Do you mean in one of the vessels we send to London?

7946. Yes.—There will perhaps be 20 tons.

7947. Would it at all facilitate your operations if you had a tugboat attached to the whole fleet, in order to bring the vessels more quickly to market; I mean the vessels in which the fish is packed in ice?—Do you mean a tugboat waiting on the fleet going to sea?

7948. I suppose you have more than one vessel going to London at the same time with a cargo of fish?—Yes, we sometimes have two or three going in the morning.

7949. Would it not be worth your while to have a tugboat to tow them up?—We have not seen the necessity for it yet. The tugs go down to the mouth of the river, and wait for them. There are always steamboats in attendance to take them to London. There would be great difficulties in the way of a steamboat going out to sea to attend upon the cutters, so much depends upon the weather. Such a system as that would be very difficult of management.

7650. Do you find that practically the system you have adopted answers your purpose?—Yes.

The witness withdrew.

(*Mr. Caird.*) We have now exhausted our list of witnesses. If any fisherman in the room is desirous of offering evidence we shall be glad to hear what he has to say.

James Thorpe examined.

J. Thorpe.

7951. (*Mr. Caird.*) Have you long been engaged in the business of a trawl fisherman?—Yes.

7952. Where?—I have been at Grimsby for about two years, but I have been at Hull and Grimsby for 22 years.

7953. Does your experience lead you to the same conclusions as those which have been arrived at by most of the other witnesses who have been examined?—Yes.

7954. Do you find the supply of fish increasing or diminishing?—Increasing.

7955. Do you find it a particularly good business to be engaged in?—Yes, I think so. I have found it so myself.

7956. Can you offer any suggestion to the Commissioners with regard to the supply of fish that has not already been presented to us in the course of the evidence we have heard to-day?—I do not think that there is anything I can add; we always find plenty of fish, and there is more now than there was before. I have known vessels trawl over one piece of ground regularly 28 years; they have been trawling there ever since, and there is more fish now than ever there was before.

7957. What piece of ground is that?—It is a piece of ground called the "Ridge."

7958. How far is it from the shore?—About 10 miles from the shore off Dover.

7959. Have you been there this summer?—I have been there, but not this summer.

HULL.

J. Thorpe.

3 Oct. 1863.

7960. Then have you heard that that has been the case?—Yes.

7961. Can you give us the history of that piece of ground?—It is a narrow piece of ground about a quarter of a mile wide. The vessels go down to trawl it one after another, and they will find as much fish next month as they can find to-day.

7962. Has it been long fished?—Yes, for centuries.

7963. And it is never found to be fished out?—Sometimes it will fail for a week or two, and after that there will be as much fish as ever.

7964. Are there plenty of fish there now?—Yes, there is quite as much now as ever there was. I have known 26 or 27 vessels fishing there three tides a day for a week, and the next you would get as many turbot and brill as you liked. The fish got there are principally turbot and brill.

7965. Then you do not find that your operations frighten away the fish?—No, I think the more the ground is stirred up the more the fish come.

7966. Do the long-line fishers fish there?—I have not seen them.

7967. Did you ever come into contact with the line fishermen?—Yes, plenty of times.

7968. Did they find fault?—I never heard them grumble.

7969. Have you drawn the trawls over them without damaging them?—Yes, except taking a hook off here and there.

7070. Have you never taken up their lines?—No, and I have been over them scores of times.

7971. (*Professor Huxley.*) Are you a Dover man?—No, I belong to Hastings.

7972. Were you in the habit of trawling over the piece of ground you describe before you came to Hull?—Yes.

7973. Do you keep up your connexion there?—Yes.

7974. I mean do you know a good many people there now?—No, I have not been there for 26 or 28 years.

7975. Are there many trawling boats that go there?—Yes.

7976. Are there as many as went in your time?—I think there are more.

7977. They have not fished out their ground yet then?—No, I have not been there these last two years. We used to go generally to Rye Bay to fish.

7978. Did you always find plenty of fish there?—Yes.

7979. Did you know many owners of well-smacks?—Yes, nearly all at Grimsby.

7980. Are they well to do, or are they all losing 200*l.* a year by each vessel?—I think they are all pretty well to do, or else they would not keep up their vessels very long. Perhaps if they got other people to do their business they would not manage it as well.

7981. Do you think if people were losing money by these smacks that they would soon get tired when they found they had burned their fingers, and give it up?—I think so.

7982. Have you been in the habit of fishing on the same grounds as the well-smacks?—Yes.

7983. Do you get on well together?—I never heard anyone find fault. I have been to Iceland with them. Those vessels have been there for many years past, and there have been more vessels lately than ever I knew before.

7984. Do you mean in Iceland?—Yes.

7985. How close to the shore?—It depends on the weather whether you have to keep far out at sea.

7986. Do you trawl about the Iceland coast?—No; we fish there with hand-lines.

7987. Then you have been hand-lining?—Yes; I have been engaged in it for four years.

7988. Do you use the same vessel for hand-line work and for trawl work?—Yes, the trawl-boats will do very well for salt-fishing.

7989. Do you ever use the long-lines?—No, only the hand lines. Our vessels are very badly adapted for long-lining, or indeed for hand-lining.

7990. (*Mr. Caird.*) Are there any trawl-vessels at Hastings?—There are some trawling boats, there are no smacks.

7991. Do you mean trawl-boats that trawl in-shore?—Yes; they go into the bay, or perhaps 16 or 18 miles out to sea.

7992. Are they undecked boats?—Some are decked boats, and some are open boats.

7993. What is the length of the beam they carry?—About 30 feet.

7994. What kind of fish do they catch?—Plaice, haddocks, turbots, and dorcys.

7995. Then they carry on with a smaller boat the same kind of business you do?—Yes.

The witness withdrew.

J. Johnson.

JAMES JOHNSON examined.

7996. (*Mr. Caird.*) Are you a fisherman here?—No, I am at Grimsby.

7997. Are you a line or a trawl fisherman?—A trawl fisherman.

7998. Have you been long in that business?—Yes, for four or five years.

7999. At Grimsby?—No, at different places. I come from Devonshire.

8000. Can you give us any different account from that which has been given to us by other witnesses?—No, not particularly. In 1835 I came down here in Yorkshire on an expedition in search of fish. We went to Scarborough to fish. We used to get something like 50, 60, and 70 pairs by our day's work, and we brought them in.

8001. Do you mean pairs of soles?—Yes.

8002. Was that with the trawl net?—Yes, and we got plaice also. There was generally a very few plaice and a few haddocks. We continued at that till the people of Scarborough drove us from their coast and would not let us fish on the ground where they fish any longer; consequently we had to go further away to what we call now the "off ground", and we used to get from there from 800 to 1,000 pairs of soles, with some plaice and haddock, and we brought them to Hull, and from that time I have been fishing here.

8003. Have you found during your experience there that the quantity of fish you can catch is increasing?—If we did not catch more than we did then we should do a very small matter. We catch now four or five times the quantity, but our vessels are larger and more expensive.

8004. Are the fish better in quality?—Yes, I think they are, if anything.

8005. Do you agree with the previous witnesses with regard to other matters?—Yes.

The witness withdrew.

H. Toozes.

HENRY TOOZES recalled.

8006. (*Professor Huxley.*) What is it you wish to say?—We should be glad if you would explain to us the size of the mesh, and how we are to measure it; I have a piece of net here and it would be satisfactory to all of us to know how to measure the mesh.

8007. I will read to you the regulation: "Trawls "shall be made with nets, the meshes of which shall "be made at least one inch and three quarters square "from knot to knot along the line."—That would be on what we term the "bar" of the mesh.

8008. Yes, it would be four times that round?—Yes.

Article 19 says: "The under part of the trawl "net from a length of 10 feet to its extremity may be

HULL.
H. Toozes.
3 Oct. 1863.

" strengthened by rubbing pieces made of old nets, " but these rubbing pieces shall be so fastened that " they shall not cross or narrow the mesh of the " trawl net, which must always remain at least across " one inch and three quarters from knot to knot along " the line, open and unobstructed."

8009. Is that a new trawl net?—Yes. (*The witness produced a portion of a net.*)

8010. What is it along the line ?—I do not know exactly.

8011. I find it is $1\frac{1}{2}$ or $1\frac{5}{8}$ of an inch at the outside, that is not large enough according to the law ?—I believe it would be beneficial to our business at large if we were compelled to carry out the Act of Parliament. With regard to the beam, the Act says the beam shall be no more than 38 feet long, and that the trawl irons shall not exceed 287 pounds.

8012. (*Mr. Caird.*) Why do you think that would be beneficial ?—Because the length of the beam seems now to be very much growing; we have larger smacks than we used to have, and every one is trying to extend over another in the length of the beam, thinking that they will get more fish in consequence. Some of their beams are 45 or 46 feet long; others are 40 or 42 feet; now I believe they do not spread over more ground than a beam 38 feet long, but they are so long that they bend, and they are more liable to break. It is a very common occurrence for two or three to break during the winter time.

8013. But they are not compelled to have them longer than they like ?—No, but if we were compelled to work them 38 feet long no one would have one longer.

8014. They might have the beam 38 feet now if they chose ?—I think it would be very beneficial to compel them to have it that length.

8015. You think it would be very beneficial to be compelled to act according to your own interest ?—I believe so.

8016. Have you not sense enough to attend to your own interest without compulsion ?—Taking one time with another, I believe we should be better off with beams 38 feet long.

8017. But if other people think they would not be better off with that length why would you compel them to adopt it ?—The Act of Parliament says the beam ought to be a certain length, and I think the fishermen ought to be compelled to carry out the Act.

8018. You think it would be better for them if they were compelled to work with a certain beam ?—Yes, if the French and others had beams of the same length.

8019. (*Professor Huxley.*) This Convention binds the French, but I am not aware that it does the Dutch or the Belgians ?—We ought to act up to one thing. No person ought to work with a mesh smaller than $1\frac{3}{4}$ inch, yet I believe there are very few out of this port who have so large a mesh at the bag end of the net.

8020. I believe you do not wish to have the Act of Parliament enforced with regard to drift-net boats, namely, that you should clear out of their way for three miles whenever they come on the ground. Would you wish to have that clause repealed or enforced ?—I should like to have it repealed or they would drive us out of the sea altogether.

8021. Suppose there were no regulations of any kind whatever, would you sooner have regulations made, or would you prefer being allowed to follow your own inclinations ?—We act pretty much as we like now.

The witness withdrew.

The inquiry was adjourned until Saturday, October 10, at Brixham.

Brixham, Devonshire, 10th October 1863.

PRESENT:

JAMES CAIRD, Esq., M.P. (Chairman). | Professor HUXLEY, F.R.S.

BRIXHAM.
W. F. Collier.
10 Oct. 1863.

WILLIAM FREDERIC COLLIER called and examined.

8022. (*Mr. Caird.*) You are the secretary of the fishing club here, I believe ?—Yes.

8023. What is the object of that club ?—The insurance of the different smacks belonging to the port.

8024–5. Is it a mutual insurance club ?—Yes.

8026. Are you well acquainted with the state of the fishing interest in this quarter ?—I am not particularly well versed in it, but there are other witnesses here who will give you every information you want. I can tell you the number of vessels insured in the club, and the estimated value, or anything in that way.

8027. To what period back does your acquaintance with this district extend ?—I have been living here all my lifetime.

8028. How long have you been the secretary of this club ?—Three years now.

8029. Can you tell us the number of vessels at present engaged in trawl-fishing, here ?—The number of vessels at present insured in this society is 152.

8030. Do they all hail from the port of Brixham ?—No; they all hail from the port of Dartmouth.

8031. What is the average tonnage of these vessels ?—The average tonnage is about 34 tons, I should think.

8032. Can you give us the largest size, the middle size, and the smallest size ?—Well, some are more than 34 tons, and the lowest, I should think, is 28 or 29 tons. Some are much larger than that.

8033–4. What is the size of the largest ?—I should say from 38 to 39 tons new measurement.

8035. Can you give us any idea whether the number and size of these vessels have increased during recent years ?—Yes, very much.

8036. Can you give us any facts upon that point ?—No, but I know that they have very much increased in tonnage of late years.

8037. Do you know what was the number 10 years ago ?—I cannot give you any information on that point.

8038. Can you say what the number was five years ago, or three years ago ?—They have very much increased; in fact, they are increasing every year. Vessels are being built much larger than they were in former years. That has been the case particularly during the last seven years.

8039. But you have no knowledge what the exact number was five or seven years ago, so as to enable you to compare it with the number now ?—No.

8040. Then do you think there is more capital being put into the business every year ?—Yes, very much more.

8041. Can you give us any idea of the amount of capital embarked in it ?—The amount of the estimated value of vessels insured in our club is about 72,000*l.*

8042. Has it increased within the last three years ? Yes.

8043. By how much ?—I can hardly say the exact amount unless I refer to the books of the club, but it has very much increased. The vessels are of considerably more value than they were. A much higher class of vessels is built now.

8044. Does 72,000*l.* represent the actual value of

BRIXHAM.

W. F. Collier.

10 Oct. 1863.

the vessels engaged in fishing ?—That is their estimated value.

8045. The estimated value of the whole number of vessels ?—No, only of those insured in our society.

8046. Does the number insured in your society include nearly the whole number engaged in fishing in Brixham ?—Yes, I should say so.

8047. Then we may take 72,000*l.* as representing the capital embarked in the fishing business here?—Yes.

8048. Is that for vessels alone, without including the tackle ?—It is for the vessels and the tackle ; the tackle is insured with the vessel.

8049. Can you tell us the number of men employed? —I cannot state that, but they average about five in each vessel, I believe.

8050. Do you know if the number employed now has increased compared with what it was some years age ?—I should think there has been a large increase, because the number of vessels has considerably increased.

8051. (*Professor Huxley.*) What is the average value of each of your vessels here?—From 700*l.* to 800*l.*

8052. Does that include the fittings ?—Yes.

8053. Do you keep any record of the number of vessels insured from year to year ?—Yes.

8054. So that on referring to your books you can tell us what the increase has been during the last three years ?—Yes.

8055. Do you happen to have your books here ?—No.

8056. Can you furnish us with an account of the increase by-and-bye ?—Yes.

8057. If you will be kind enough to send the details to the secretary we shall be obliged to you.—I will do so with pleasure.

8058. Are the vessels insured in your club mainly built by persons living in Brixham or Dartmouth ? —They are built by persons living in Brixham generally.

8059. Are they owned by the persons who work them ?—A small portion are.

8060. Are they owned by the crews ?—No, not by the crews generally ; by the masters.

8061. Are the persons who own them for the most part masters of the vessels themselves, or persons living on shore ?—There are a great many persons living on shore who own vessels, but occasionally there is a master who will buy a vessel.

8062. Then the practice is for some person on shore to equip a vessel and probably the master will have a part share ?—Yes.

8063. Have the men a part share ?—I do not know.

8064. Is that a favourite mode of investment with parties living ashore here ?—Yes.

8065. They put their money into these smacks?—Yes.

8066. Are you aware whether the value of the smacks has been falling off of late years or not ?—I am not aware of it.

8067. The increase of the capital invested in a business of this kind would rather prove the contrary, would it not ?—Yes, the increase of the capital invested has been much greater of late years. Much better smacks are built now than were built formerly,

8068. Have you yourself any knowledge of the rig. and the mode of fitting up the boats ?—No.

The witness withdrew.

E. Johnson.

Eliezer Johnson called and examined.

8069. (*Mr. Caird.*) Have you been long engaged in the business of a fisherman here ?—About 35 years.

8070. Do you still follow that business yourself ?— Yes.

8071. Do you go afloat now ?—No, I have not been at sea for the last two or three months, but I expect to go again soon.

8072. In the experience you have had here during the last 35 years have you noticed any considerable increase in the number of vessels employed in fishing ? —Yes, there is an increase.

8073. Can you tell us what the increase has been in your time ?—I have no idea. I remember when I was a little boy that I could count from 60 to 70 sail fishing out from here, but since then a great number of smacks which have been built here have gone away to different parts.

8074. So that the number given by the previous witness does not represent the whole interest of the fishing here ?—No.

8075. Many vessels built here belong now to other ports ?—Yes ; some insured here have gone to Hull, and some have gone to Ireland—to Dublin.

8076. How many are still engaged in fishing off this coast ?—About 80, I think.

8077. Has the number increased or diminished during the last 10 years ?—I think it is nearly about the same.

8078. Do these 80 vessels continue to fish very much on the same ground they did 10 years ago ?— Yes.

8079. Where is the fishing ground that is principally resorted to from Brixham ?—It runs from 30 to 40 miles from the land here.

8080. And how far east and west ?—About 20 miles east, and about 25 or 30 miles west.

8081. And within those limits has there been a fleet of about 80 boats working during the last ten or 15 years ?—Yes.

8082. Or for a longer period within your knowledge ?—Yes, for 20 or 30 years ; ever since I was a lad.

8083. Have you observed whether the take of fish in the same time by each boat has been increasing or diminishing on the average ?—In some kinds of fish I do not think there has been any decrease, but in other kinds there has been a decrease.

8084. In what kinds has there been a decrease ?— In such as hake and whiting.

8085–6. Do you not get as large a catch now of those fish as you used to get ?—We do at times, but in some seasons they fail. Last season we had a great quantity, more than we had seen for several seasons before.

8087. What kind of fish has diminished ?—Flat-fish and soles. I think they have decreased within the last 10 years.

8088. Has that decrease gone on gradually ?—Yes, I think there has been a decrease gradually every year. We do not seem to get as much year after year as we have got in years gone by.

8089. Have you observed that on any particular fishing ground ?—Yes, within our limits all over the grounds. I mean within the distance we fish in any part of the ground round about here.

8090. What do you think is the cause of that ?—I think it is caused by fishing in shallow water in the summer months.

8091. Do you mean by your trawlers fishing in shallow water ?—I mean by trawl-fishing and seineing together. Yes.

8092. What distance from shore is the damage done ?—Within the headlands, and all around the shore in the creeks in Torbay and Start Bay, and in the other bays round the coast.

8093. Do the trawl-vessels work in those bays?—Yes.

8094. What injury do you suppose they do by that means ?—They take up the small fish.

8095. Do the small fish stop in the trawl nets ?— Yes, thousands are thrown overboard that are not fit to be brought on shore.

8096. In what state are they when they are drawn to the surface ?—They are in a very good condition ; some are alive and some are dead. The fish look good, but they are so very small that there is no sale for them.

8097. When they are thrown overboard are they alive or dead ?—Some are alive and some are dead.

8098. Is any large proportion of your take of this small fish thrown overboard ? For instance, when you

drag up your trawl, suppose you have a ton of fish altogether in your net, how many hundred weight will be inferior fish and be thrown overboard?—I have been fishing in these bays, and I have seen as much thrown overboard as there was fit to be brought ashore.

8099. Is that commonly the case?—Yes.

8100. It is generally so among all the trawl-vessels engaged in fishing off this shore?—Yes, they all in turn come into the bays.

8101. Is it only when fishing in the bays that this destruction of small fish takes place?—I do not think that trawling in deep water does any injury at all; I think it rather tends to increase the fish, and no harm would be done if they would not come into the bays to trawl.

8102. What distance off the shore do you call deep water?—The water gradually deepens. What we call deep water is 30 or 35 fathoms, but we tow in these bays to within 3 or 4 fathoms at times.

8103. Do you not bring up any small fish in deep water?—We bring up a few, but not very many.

8104. Not nearly so large a proportion as you do in shallow water?—Nothing compared to it.

8105. When you bring up small fish in deep water do you throw them overboard?—We seldom get any to throw overboard in deep water.

8106. Is there any distinct difference in an average haul in deep water and in shallow water in regard to small fish?—Yes, when we get in shallow water we catch fish that are not saleable. In deep water it is very seldom that we get any small fish not fit to bring to the market.

8107. Then is it not a loss to the fishermen themselves to fish in waters where they are obliged to throw overboard a large proportion of their catch?—Yes.

8108. Then why do they do it?—I do not know; I am a deep-water fisherman. They get very little gain from it sometimes. I believe they think only of taking the large fish and do not bear in mind the destruction they occasion to the small.

8109. Do you ascribe the gradual diminution in the quantity of flat-fish to trawling in shallow water?—Yes.

8110. Did you ever see any spawn drawn up in the net?—Yes, a little sometimes.

8111. Have you ever seen it?—I have sometimes seen a little hanging about the net.

8112. Was that in deep water?—Yes, in deep water and in shallow water also.

8113. Do you get many turbot here?—Yes.

8114. Do you find them increasing or diminishing?—I think they are not as plentiful as they were a few years ago.

8115. Are they not as plentiful in deep water?—Sometimes, when we go a long way out at sea, we get a good many, but generally speaking we do not get as many all the year round as we did some years ago.

8116. With regard to cod, are they as plentiful as formerly?—We seldom get any in the trawl.

8117. Have you any notion what quantity of fish is landed here in the course of a season?—I have no idea what quantity there is.

8118. Are the fish much mangled at any time when drawn up by the trawl when you are fishing in deep water?—No.

8119. Are they when you catch them in shallow water?—No.

8120. Are they never so much bruised as to be unfit for food?—We may occasionally see one or two when we get a large quantity in the trawl. Sometimes we get so large a quantity in the net that we are obliged to put a rope round it to draw it up, and it may jam up the fish and bruise them a little bit.

8121. Have you never seen injury done by the rubbing of the trawl—I mean the scales injured or the fish otherwise damaged?—The fish caught by the trawl do not look quite as well as those caught by the hook and line, but still the fish are not injured.

8122. Is there any regulation here with regard to the size of the mesh of your trawl nets?—No; every man has his net as he likes.

8123. Is there any fishery officer, or other authority, who comes to speak to you with regard to regulating your nets, or the mode of your fishing?—There has been some one here, but I do not know whether he said anything about the size of the mesh. He ordered the boats to go out of the bays, and they did so, but soon after they came in again.

8124. What fishery officer was that?—He belonged to a cutter stationed at Dartmouth. I have heard the fact stated, but I never saw him.

8125. Was that in recent times?—Within the last five or six weeks. I have heard some of our fishermen say that the cutter sent on board and ordered the boats to go out of the bay.

8126. He ordered the trawl-boats to go out of the bay?—Yes.

8127. Do you know whether there is any regulation that might be enforced to prevent them coming into the bays?—Yes. I think the Act of Parliament says that we are not allowed to come into the bays, and we are confined also to a certain sized mesh.

8128. But you never met with anybody who endeavoured to enforce any particular size of mesh, or to prevent your fishing in the bays?—No.

8129. Do you think it desirable for the interest of the fishermen, and the consumers of fish, that some regulation of that kind should be established?—Yes, I do.

8130. What regulations do you think would be advisable?—I think we ought to be kept from the shallow water during the summer months, and we ought to have the mesh a little larger than we have it now.

8131. You say you ought to be excluded from shallow water during the summer months?—Yes.

8132. Why do you make that distinction?—Because that is the time the small fish are in the bay.

8133. Would no damage be done to the fish by trawling in shallow water in the winter months?—Not so much damage as in the summer months.

8134. But do you think there would be any?—No, I do not think there would.

8135. Then you would confine your objection to the summer alone?—Yes; say from March or April to September or October.

8136. Do any foreign vessels come here to fish?—I have seen French vessels on this coast fishing.

8137. Trawl-vessels?—Yes.

8138. Have you seen them in any great numbers?—I have not seen a great quantity. I may have seen about a dozen, or from that to 20 sail, at times, when I have happened to go a little distance off, and they have come a little nearer here in the winter season. The fish about here they come to catch are rays principally.

8139. Do they come in the bay?—I have never seen them in the bay.

8140. Do they interfere with your fishing?—Not in the least.

8141. Your fishing vessels keep the sea?—Yes, pretty nearly all weathers. We keep the sea in storms.

8142. How many men are there in each vessel?—The crew consists of four, but in many cases, where the vessels are large, and in the winter time, we go with five hands.

8143. And how long do you remain out at sea on the average?—That depends on our catch of fish. We commence on the Monday morning, and as we get the fish, we come in again, and we go out again to make the week until the Saturday. If we do not get the fish then we do not come in at all until the week is up.

8144. Do you always come in with your own catch of fish?—No, we send it in by others sometimes.

8145. And you keep at sea?—Yes.

8146. Have you a regular system of that kind?—No. One man may have a good catch of fish and think proper to go to market and the others who have probably not got so much will send their fish by him.

8147. Is there much line-fishing followed from this port?—Yes.

BRIXHAM.

E. Johnson.

10 Oct. 1863.

8148–9. Fishing with long-lines?—There are not many long-lines; it is mostly by hand-lines.

8150. Have you had any complaint made against you in consequence of fouling the lines?—I never heard any from this place.

8151. Is there any herring fishery here?—Yes.

8152. Is it a successful fishing?—No, I think it does not amount to much.

8153. Do the trawl-boats take any part in it?—No.

8154. Is it followed by the long-line fishermen and the line fishermen generally?—Yes; I think when the season comes for herring they stop their line-fishing and go to the herring-catching.

8155. Has this catch been diminishing or increasing of recent years?—I cannot tell you much about it. I never had anything to do with it.

8156. Has it ever happened to you that you have been enabled to give assistance to vessels in distress?—Many times.

8157. Have you met them in the Channel?—Yes.

8158. Have many of the trawl-boats connected with Brixham been in a similar position?—Yes, many of them. Only last week one went up the Channel with a ship. Many cases occur in the course of a winter season. The ships are very glad to get the fishermen to come on board and take them into port and go up the Channel with them.

8159. Taking your long experience as a fisherman, and all the interest you have in the business, have you on the whole found that it is a paying business?—I have got a living out of it; I have not made a fortune out of it.

8160. Have you not increased and improved your circumstances?—Yes.

8161. You began by being the owner of a trawl-vessel?—No, I began with my two hands.

8162. Are you now the owner of a trawl-vessel?—Yes.

8163. Have you an interest in more than one?—Yes.

8164. Are there many men engaged in that business in the same position?—Yes, many.

8165. Do the fishermen's sons as a rule follow the business of their father?—Some do and some do not. Some go away in foreign-going ships.

8166. Are there many strangers who come here in order to go into the fishing business?—Not a great many.

8167. We have been told that a great many of the Brixham fishermen have left Brixham and gone further north in consequence of all the fishing grounds here being exhausted, is there any truth in that?—No; I was in the north many years myself and I came back to the south again.

8168. Why did you do so?—Because I can do better here than there in the summer season.

8169. Do you find as many fish?—I find as many as there were 30 years ago, but I do believe that there is a decrease in flat-fish and soles.

8170. How is the price of fish compared with what it was before the railways were opened in this part of the country?—That depends upon the quantity caught. Sometimes fish are at a great price, and sometimes they are very cheap.

8171. Take an average price for one season here?—I believe the fish bring as much now as they did then.

8172. Do they not bring more?—I don't think they do.

8173. How did you get your fish to market 20 years ago when you had large catches?—They used to go by waggons and stage coaches.

8174. Then you could not get it to the market fresh?—No.

8175. Did it cost you as much?—No.

8176. Was not the price of the carriage by waggons and stage coaches more than it is now?—I don't think it was; but we used to sell it to the buyers. We had not much to do with the carriage.

8177. But you would see the result of that in the price you got for the fish. Was the price then as good as it is now on the whole?—I think it was.

8178. (*Professor Huxley.*) What is the length of the beam of your trawls here generally?—It depends on the length of the vessel.

8179. What is the average length?—About 40 feet.

8180. Why does it depend on the length of the vessel?—A longer vessel will have a longer beam; we want the fore part of the beam to come to the after shrouds of the ship. If that were not so there would be great danger at times. The beam would tumble against the bulwarks and stanchions, and perhaps break them down.

8181. What is the average length of the beam?—About 40 feet; some are 42 feet, and some are only 38.

8182. What is the weight of the head irons?—That depends on the size of the ship. The average is about 220 or 230 lbs.

8183. Are there any much heavier than that?—There are some large vessels that have them 280 lbs., but I think 220 or 230 lbs. is about the average of the fishing boats out of this port.

8184. What is the size of the mesh?—The size of the mesh varies. I have a sample of a mesh in my hand which you may perhaps wish to see; that (*producing a piece of net*) is about the largest sized mesh we have.

8185. That is about $2\frac{1}{2}$ inches from knot to knot?—Yes.

8186. What is the smallest size?—That (*producing another piece of net*) is the smallest size for a trawl net.

8187. That is about one inch from knot to knot?—Yes.

8188. Do you use different sized meshes?—The large mesh is about the size at the largest part. We construct our trawls for about 40 feet of that size, and then we gradually decrease the size.

8189. Is the pocket made of that small size?—Yes.

8190. Does your trawl go to a single pocket at the end, or are there any side pockets?—There are side pockets.

8191. Are both the side pockets made with the small mesh?—It is formed out of part of the trawl. It is not a piece put in.

8192. Do you load the foot rope of your net?—Yes.

8193. Do you load it with lead?—No.

8194. What do you load it with?—We put other ropes round it; we do not load it with lead, or chains, or anything of the kind.

8195. Have you ever had anybody objecting to your trawl beam being 40 feet long?—No.

8196. Are you aware of the existence of a law on that subject?—Not at all.

8197. Did you ever heard of this law: "The length of the wooden yard or beam to which the upper part of the mouth of each trawl net shall be fastened shall not exceed 38 feet"?—I don't know anything about that.

8198. Have you never heard of it?—No.

8199. Did you ever hear of this: "The total weight of the two irons or head pieces of a trawl shall not exceed 287 lbs.?" Were you aware of that?—No.

8200. In your knowledge of this port, has anybody ever called your attention to the regulations which I have just read to you?—No.

8201. No one has ever attempted to seize your nets on the ground of their not complying with that regulation?—No.

8202. I suppose you carry on your trawling when the herring-fishing is going on here?—Yes.

8203. Do you trawl over the ground where the herring-fishing is going on?—The herring-fishing for the most part is carried on here in the bay.

8204. But supposing the herring-fishing was going on in that part of the sea where you are in the habit of trawling, would you trawl there?—If we saw the herring boats we should not put our trawl down among them.

8205. If they came down to you, would you get out of their way?—I don't think I should.

8206. Have you ever heard of any law on that point?—No.

8207. Did you ever hear of this article: "Trawl-boats shall always keep at a distance of at least three miles from all boats fishing for herrings or mackerel with drift-nets"? Was that ever brought to your knowledge here?—No.

8208. Did you ever hear of this article: "Whenever herring or mackerel boats shall commence drift-net fishing in any place whatever, the trawl-boats which may already be fishing in such place shall depart therefrom, and shall keep at a distance of at least three miles from the said drift-net, herring, or mackerel boats"? Have you ever heard of that?—No.

8209. Nor has there been anybody to call your attention to it?—No.

8210. Is there any superintendence over the fisheries here; does the Government cutter come into the bay?—I was never boarded by him, but he comes in and out of the bay.

8211. As far as the fishermen here are concerned, in all your experience these regulations have been a dead letter?—Yes, we get foul of each other sometimes, the drift-nets and the trawls; we get ourselves clear as we best can, and fish away again.

8212. Is there any circle net fishing here?—Yes, I have had some experience of that.

8213. What sort of a net do you use?—The seine net.

8214. Is that a long net with a pocket?—No, there is no pocket.

8215. There are no pockets in your seines?—No, only a bunt. It goes right round, and the bunt goes back.

8216. What is the length of your seine?—From 170 to 200 fathoms.

8217. What is the depth; how many meshes?—I don't know how many meshes.

8218. What is the depth?—About 4 fathoms.

8219. Is it as deep as that at each end?—No, it is not so deep at the ends.

8220. Does it go off shallow at each end?—Yes.

8221. What is the greatest depth at the ends?—It is about two fathoms deep at the ends.

8222. What is the size of the mesh?—I have a bit of the seine net in my pocket. That (*producing it*) is the size of the bunt of the seine.

8223. Are all the meshes of the same size?—No, they are larger at the ends, but this is the bunt.

8224. This is not much more than half an inch?—No. These seines don't injure the fishing in the bay; they are shot for shoals of mackerel.

8225. Well, then, your net having the structure you describe, how do you use it?—It is put into a boat. There are six men in the boat, and they are all ready on their oars. As soon as the fish rise they pull round the fish. They bring their nets as near into the shore as they can, so that the rope will soon reach the shore.

8226. Is the other end made fast?—Yes, the end of the net is made fast in the first instance before the rest of it is taken away in the boat.

8227. Then the boat takes the rest of the net and pays it out?—Yes.

8228. You make a circle and come round, bringing the other end to the place where it is fast?—Yes.

8229. And then you haul it into the boat?—Yes, There are two men at each end. We keep as close together as we can, and bring the bunt close up to the boat. When we are pretty near in, the net is hauled up quick, and the fish are in the bag.

8230. Do you take your fish on board?—Yes.

8231. You don't haul it to the shore?—No.

8232. Why not?—We could not do it. It would be too heavy. There is generally too much weight.

8233. Then you use the net only when you see large shoals of fish in-shore?—Yes.

8234. Do you use it for mackerel?—Yes.

8235. And for pilchards?—Yes.

8236. Is the ordinary tuck seine used for pilchards?—Yes.

8237. Just the same size?—Yes.

8238. Do you use it for pilchards here?—Yes.

8239. Are pilchards abundant on this shore?—Yes, they have been this season, but they have not made their appearance before for some time.

8240. Then you only use it when shoals of mackerel or pilchards come in-shore?—Yes.

8241. You are not in the habit of using it for sweeping the bays?—No.

8242. Is seincing of the ordinary kind practised on this shore; I mean where you haul the seine with a pocket ashore?—No, not in this part.

8243. Where is it practised?—At Paignton and Torquay.

8244. Are there many seines used there?—Yes, at Torquay.

8245. Do they use them in the summer principally?—Yes.

8246. And they just sweep the bottom of the bay or the shallows?—Yes, they carry out their seines with a length of rope, and they haul them ashore on the sands.

8247. In the ordinary fashion?—Yes.

8248. Do they get up all kinds of fish?—Yes, we have had a sample of it brought to this market.

8249. What is the size of the mesh of their seines?—It is very small.

8250. Is it smaller than that you showed me just now?—Yes.

8151. Have you a specimen of the mesh?—Yes (*producing it*). There is a specimen of the bunt of the sprat nets.

8252. May we keep these specimens?—Yes, and here are some of the fish caught with the small nets (*producing them*). They were brought here with some other fish. This is a little turbot. This is a sole. There are hundreds of them dragged ashore on Paignton Sands, and all round the coast, and in many cases they are allowed to lie and perish on the sands.

8253. Where were these fish sold?—They happened to come in a boat along with some pilchards. They were dragged in the seine with the pilchards.

8254. Where do the men of Paignton and Torquay get a market for these fish?—At their own towns, and sometimes they bring it here as well.

8255. It is bought by the poor, I suppose?—Yes, and by the fish buyers.

8256. You spoke of these nets being used by the sprat fishermen; are there many sprats here in the winter?—There are not many sprat seines here.

8257. Are there at Torquay?—Yes, there are at Torquay and Paignton. I have known as many as three or four vessels loaded here in a day, to carry away to Portsmouth.

8258. Were they loaded with sprats?—Yes, sprats caught at Torquay.

8259. When does the fishing go on?—About the month of November.

8260. Does it continue during the summer months?—Yes, they don't stop here long; perhaps a month, or five or six weeks, and then it is all over, but I never had much experience of the spratting.

8261. Is there any other mode of fishing here; do you fish here for turbot with nets?—Only the trawlers.

8262. No turbot nets are set?—No.

8263. What do the long-line fishermen catch?—Conger eels, ling, and codfish principally, and skate.

8264. Do they fish over the same ground as you?—No, they pick up rougher ground than we like to go over with our trawls, but we do sometimes get on the same ground.

8265. How many lines do the long-line fishermen carry?—A dozen or 14.

8266.—What kind of boats do they use?—Boats of about 4 or 5 tons.

8267. Are they open boats?—Yes.

8268. Have they no decked boats?—No decked boats for long-line fishing.

8269. You were speaking just now of trawling in shallow water; is that practised by the same persons as those who, like yourself, practise deep-sea trawling?—Yes.

8270. And with the same instruments?—Yes.

BRIXHAM.

E. Johnson.

10 Oct. 1863.

8271. With the same vessels also?—Yes.

8272. Do you find that the large supply of small fish brought in in that way has a tendency to lower the price of fish in the market?—Yes.

8273. Does it damage the sale of large fish caught in deep water?—Yes.

8274. Does it lower the price?—Yes.

8275. Do you know what markets your fish here go to?—It is sent all over the country. A great part goes to London, Birmingham, Bristol, Bath, Exeter, and many other large towns. Then there are places round this neighbourhood, such as Totness and Taunton.

8276. Is that small fish sent round to the inland markets in the same way?—No, not much of that.

8277. Is it sold about here?—Yes.

8278. Is it hawked about by the hawkers?—Yes.

8279. Then I do not understand how it interferes with the market for other fish?—If it was not brought in they would be obliged to have larger fish.

8280. The larger fish are sold at a higher rate?—Sometimes it is very cheap, and sometimes it fetches a good price.

8281–2. Is not the small fish bought by people who could not afford to buy the large fish?—Very likely it is.

8283. Are the long-lines set in the winter time?—No, not in the dead of the winter. They are mostly set in the summer time. Their boats are not fit to stand the bad weather.

8284. Is that long-line fishing carried on by the same men as the hand-line fishing?—Yes.

8285. Did you ever hear of any complaints against the trawlers for interfering with the lines of the long-line fishermen?—No.

8286. Have they never been charged with carrying away the lines?—I never heard any complaint.

8287. Do you trawl over the ground where the long-lines are set?—No, they are mostly set on the rough ground, where we don't like to put our nets down, but we trawl among them when they are using the hand-lines.

8288. (*Mr. Caird.*) Would it be a hardship on the trawlers to be excluded from the shallow waters, where you say all the harm is done?—No, I think not.

8289. If a regulation of that sort were established you say it would be of no injury to the trawl-fishers themselves?—It would not injure them if they were kept out of in the summer time.

8290. Do you think it would benefit the line fishers very much?—I think it would benefit all of us.

8291. Would it lead to an increase of fish?—Yes.

8292. Is that because you would not disturb the ground where the young fish are?—Yes, we should not disturb the young fish, and in the winter time they would go out into deep water.

8293. You said that the seine nets which are used here destroy large quantities of young fish?—Yes.

8294. Then trawling is not the only mode by which small fish is destroyed in these bays?—I do not think the trawl-boats do as much injury as the drag nets.

8295. Would you put a stop to them?—Yes.

8296–7. On the ground that they are injurious to the supply of fish?—Yes, I would put a stop to the trawlers going in in the summer time, and to the dragging of the seines at the same time. There is another kind of net used over about Paignton which is also very injurious.

8298. What is that?—That is what is called a horse trawl, which is dragged by a horse. I have never seen it, but I have heard our people talk about it. They bring up a great quantity of small fish. They drag for shrimps with a horse and cart. The horse goes up to his belly in the water, and he drags the net after a cart, and you get many small fish. Thousands of them are brought in in that way.

8299. You say you have never seen that done?—No.

8300. Is there any witness here who can explain what it is?—Yes, I think there is.

8301. Are there many shell-fish caught off this coast?—Yes, a great many.

8302. Are they increasing or diminishing?—I cannot say that they are, because when we catch them we throw them overboard again. Sometimes we get a great many of them. At other seasons we don't get so many. On the whole the quantity seems to be much about the same as it was.

8303. You yourself do not fish for shell-fish?—No, they come up occasionally in the trawl with the other fish.

8304. And do you not keep them when you get them?—Not often.

8305. Are they not worth keeping?—We don't get any sale for them.

8306. Is there anybody who follows the business of fishing for shell-fish here?—Yes, there are people who go fishing for oysters in the season.

8307. Oysters, crabs, and lobsters?—There are crabs and lobsters as well. If we catch any we bring them ashore. But with regard to the other shell-fish, such as quins and the like of that we don't bring them ashore.

8308. Do you get many crabs and lobsters in your trawl?—Yes, at times.

8309. (*Professor Huxley.*) Is there any regular lobster-fishing about here?—Yes.

8310. Do they set lobster pots?—Yes.

8311. At what time of the year?—Mostly in the summer time, from the spring of the year up to about this time.

8312. Have you practised that kind of fishing yourself?—No.

8313. Is there anybody here who has practised it?—Yes, I think so.

8314. There is oyster-fishing here?—Yes.

8315. Are there oyster banks off here?—Yes, in Start Bay, but I don't know much about the oyster-fishing myself.

8316. Does any regular oyster-dredging go on here?—Yes.

8317. Are there many boats employed in it?—Not many.

8318. How many?—Five or six.

8319. Is there any other kind of fishing than those you have mentioned?—No, I think you have heard all about the different sorts of fishing except the shrimping.

8320. Is shrimping much practised here?—Yes.

8321. Is it practised by Brixham men?—There are different ways of catching them. Some will go with nets shoving them up and down. Others will go out all night setting traps for them and dropping nets down.

8322. With a hoop?—They set a net with bait for prawns.

8323. Have you used that sort of net?—Yes.

8324. What is the size of the hoop?—About 2 feet or 2½ over. The net gradually decreases as it goes down towards the bottom.

8325. How long will the bag be?—It is of no great depth, perhaps about 2 feet from the centre of the hoop.

8326. What is the size of the mesh?—That (*pointing to a net*) would be the size of the mesh at the bottom. I mean the sprat net. The upper part would be about the size of the next mesh to that.

8327. Is there a cross on the top to fix the bait upon?—Yes, lines go across the top to fix the bait, and they are fitted with a triangle to haul them up square.

8328. What depth of water is that net let down in?—5, 6, or 7 feet. It depends on the height of the tide.

8329. What do you bait it with?—Fish.

8330. Fresh or stale fish?—Fresh fish generally.

8331. Is it dropped over the stern of a boat?—No, they are put down in a row, about a dozen and a half of nets at a time. Two men go out with them. They put one down here, and another a certain distance off.

8332. Are buoys attached to the nets?—Yes, and they keep going along and hauling them up.

8333. That is the way they catch prawns here?—Yes.

8334. Do they catch crabs in that way?—Sometimes crabs will get in after the bait.

8335. Did you ever hear that called a trunk net?—No.

8336. What name do you give it?—We call it a prawn net.

8337. Is it not regularly set for crabs?—No.

8338. But sometimes you catch crabs in it?—Yes, and sometimes lobsters.

8339. What kind of net is used for catching shrimps?—They have a net they push before them. It is a kind of oval net.

8340. Do they catch many fish in that?—I never had any experience of it. I cannot say.

8341. Is there a large quantity of shrimps caught in the bay?—Yes.

8342. Do you think that shrimping does any harm?—I do not think it does in the way these men catch them, or by dropping nets on the rocks, and hauling them up. If any little fish get in, they are generally thrown overboard again.

8343. With regard to the other way, thrusting the net before you, does that do any harm in catching the small fry?—I have never seen them at work so as to know what they dragged up.

8344. Do you have any particular kind of vanes on the mastheads of your smacks?—Yes, we have generally a red vane.

8345. Do you use any colour you like?—We are not confined to colour. Some people fancy a bit of blue, others a bit of white, but it is principally red.

8346. Have you ever heard of any regulation upon this matter?—I think I have.

8347. At any rate you have not paid attention to it?—No, we don't pay attention to all we hear. Perhaps it would be better if we did.

8348. Are all your smacks numbered?—Yes.

8349. Who looks after that?—The Coastguard.

8350. The Custom House?—Yes.

8351. (*Mr. Caird.*) Have you ever fished on the French or Dutch coast?—I have fished on the Dutch coast.

8352. Did you meet any Dutch trawlers?—Yes, I have seen French, Dutch, and English trawlers all fishing together.

8353. Have you fished there for successive years?—Yes, for many years. I was fishing there right off for 20 years.

8354. Did you notice whether the number of boats was increasing or diminishing during those 20 years?—I think they have increased.

8355. Did they fish very much on the same ground?—Yes.

8356. Did you not find the ground giving way by being repeatedly fished over?—Some seasons we got plenty of fish, and at others we hardly got any. We were then obliged to shift about to other parts of the ground. If you cannot get fish, you take up the trawl, and go somewhere else till you find plenty. The fish change about. Sometimes they are in the Silver Pits, sometimes on the Dogger Bank, and at other times off the coast of Holland.

8357. Then you follow the fish about wherever you think there are most of them to be found?—Yes.

8358. Do the Dutch use a trawl the same as yours?—It is not quite the same, and it is smaller.

8359. In what does it differ?—The cod end of the trawl is larger, but not so broad.

8360. Is the mouth as long?—It is longer, but not so far down the rope as ours.

8361. Is the length of the trawl as great?—Yes, just about the same. It may not be quite as long as some of our big smacks have got.

6382. You have never been interfered with when you were fishing on the Dutch coast?—Not at all. I have been very near the Dutch coast, but not so near to the French coast.

8363. Has there ever been any collision between you?—No.

8364. You never came into collision or dispute with the foreign fishermen?—No.

8364*a*. Have you ever sold your fish in a foreign port?—Years ago I did, but a law was passed that we should not do so, and I have not done so since.

8365. Do you think it would be of advantage to you as fishermen to be allowed to do so if you chose?—Yes, I think it would be of advantage if we were allowed to sell our offal fish to the French boats.

8366. I do not mean to the French boats, but would it be of advantage to you to be allowed to sell your fish in French ports?—I was never in any port there.

8367. Did you ever sell any in any port in Belgium or Holland?—No.

8368. Do you think it would be of advantage if you were enabled to go to the nearest port, whether home or foreign, where you could sell your fish?—I should think it would.

8369. Do you think it would be of advantage if you were enabled to sell your fish to the French fishing boats?—Yes, the French fisherman used to come to buy them as fast as we could catch them.

8370. That was because they had a bounty for it?—I don't know why it was, but we used to get their gold and they had our fish.

8371. And that was put a stop to?—Yes.

The witness withdrew.

JAMES SALTER called and examined.

J. Salter.

8372. (*Mr. Caird.*) Are you a trawl-fisherman?—Not at present; I am a fish salesman, but I was a fisherman for 20 years.

8373. When did you cease to be a fisherman?—Nine years ago last August.

8374. Are you an owner of trawl-smacks?—Yes.

8375. Have you observed whether the number of trawl-vessels has been increasing or diminishing?—They have increased during the last seven years.

8376. Has the quantity of fish brought here for sale increased or diminished?—I should think that some classes have diminished.

8377. What classes do you think have diminished?—Flat-fish and soles.

8378. Have you noticed whether there has been any marked diminution in the quantity of flat-fish and soles?—I have not kept any statistical account.

8379. But by your own purchases and sales are you not enabled to answer the question?—There is a great decrease in flat-fish and soles.

8380. Within the last seven years?—Yes.

8381. Have the other kinds of fish, except flat-fish and soles kept stationary, or have they increased in quantity?—That will depend very much upon the season, but taking the average of seasons they are just near about the same.

8382. Amongst the flat-fish do you include turbot?—No, we include plaice, dabs, flukes, and flounders.

8383–4. And the soles have decreased?—Yes.

8385. Have the turbot increased or diminished?—They are about the same.

8386. To what do you ascribe the diminution in flat-fish and soles?—My conviction is that it is owing to fishing in the shallow waters in the bays within the headlands, and also using the drag seines. All up and down the shores where there is a creek or bay, there they shoot their drag nets.

8387. What do they get in these shallow waters?—A variety of fish chiefly of the flat-fish kind, and there are some small whitings among them.

8388. Do you think they destroy many small fish that are unfit for food?—Yes, an abundance of it. They drag them up, and I have seen them used as manure.

8389. Have you seen that yourself?—No, I have

BRIXHAM.

J. Salter.

10 Oct. 1863.

not been fishing at Paignton, Torquay, Dawlish, or Babbicombe. That is where they get them.

8390. You have never seen them get them yourself?—I have seen them taken for manure here.

8391-2. Was that because the fish were small?—No, because they could not get a sale for them.

8393. Has the trawl business been profitable here during the last seven years?—Yes.

8394. When you were a fisherman yourself and in the habit of going to sea, do you remember whether any large proportion of the haul consisted of small immature or damaged fish?—That would depend on what part of the coast we were dragging. If we were dragging in the bays between the headlands we would get large quantities which we were obliged to throw away.

8395. Were they too small for the market?—Yes.

8396. How is it in deep water?—We don't get small fish out in deep water. Sometimes in stormy weather the boats cannot come in-shore, and then the fish are necessarily damaged by being too long kept.

8397. Does that happen very often?—No, not often. It happens also sometimes in the summer when we have no wind to enable us to bring them to land fresh.

8398. Is that the time when you principally object to fishing in shallow waters?—Yes, within the headlands and in the bays.

8399. Is it equally objectionable in the winter time to fish within the headlands and the bays?—No, I think not.

8400. For what reason?—Because we should not then be able to go out into deep water to get a loaf of bread.

8401. But that does not apply to the destruction of fish?—What was the question?

8402. Would it be equally objectionable in the winter time to fish within the headlands and bays?—I do not think so, because I think the fish spawn chiefly in the summer time.

8403. Have you found in your experience of fishing within the headlands in calm weather that you do not get so large a proportion of small immature fish in the winter time?—There is no comparison.

8404. Have you found that yourself?—Yes. When the waters get cold, when there is snow and ice, the fish will leave the shallow water and go to the deep sea. We always experience that.

8405. Then you could not catch so many fish in the shallow water in the winter time?—No; most of our men can prove that.

8406. Do they not fish in shallow waters in the winter time?—They do occasionally.

8407. But not successfully?—No.

8408. Could they always make better fishing if they went out into deep water?—Yes, if the weather would permit.

8409. Then it is only on account of the weather that you fish in-shore?—Yes.

8410. Are there any other fishermen who fish in-shore?—There are no particular men that practise it more than another. I won't draw the line in that way. Perhaps some old gentleman may try with his boat, and pop into the bays; but there is no particular class of fishermen who use the bays for particular kinds of fishing.

8411. Then if you think that the injury is done by trawling in shallow water, why do you follow it?—There are a great many of us who don't like shallow-water fishing. Others do like it. They pop in, and at times they get a shoal of fish.

8412. You think that ought not to be allowed, and you desire to see all the fishermen put under the same restrictions?—I for one have a great desire that it should not be allowed.

8413. Do you think that by excluding the fishermen from the bays it would tend to increase the general supply of fish?—Yes, I think it would be of general benefit.

8414. Would you place any limit beyond which you would exclude the trawl-fishers from the shore?—Yes.

8415. To what depth of water, or how many miles off would you confine them?—I cannot say what depth of water. We have deep water close in shore.

8416. How many miles off would you keep them?—A mile and a half.

8417. You would not have them trawling closer in shore than a mile and a half?—No, that would be very good.

8418. If a rule of that kind were established do you think it would be sufficient to meet your objections?—Yes.

8419. Then in the summer months you would allow them to trawl a mile and a half outside the shore?—Yes, a mile and a half outside.

8420. But a mile and a half would bring them within some of the headlands?—Yes, in certain places.

8421. That would bring them within the headlands in Torbay?—But I mean outside the bay altogether.

8422. Would you draw the line outside the bay from the headlands?—Yes, I would take a mile and a half from the heads and draw a line from that up and down, and I would not allow them to come within that.

8423. Would that benefit the line fishermen?—I cannot say; there are hook-and-line fishermen here, long-liners and hand-liners, but I never followed it.

8424. Have you found in your experience as a trawl-fisherman that the fishing grounds you are in the habit of trawling upon are becoming exhausted of fish?—No.

8425. I mean out in the deep sea?—No.

8426. Have you found the contrary?—Not particularly.

8427. Have you found that if several trawl-boats follow each other over the same ground that each boat will get about the same quantity of fish?—Yes, if Jack gets a good load to-day Tom and Bill would like to be in the same place to-morrow.

8428. They would try to follow him?—Yes, right upon his heels.

8429. Is that attended with success?—If there are ten in a line we find that the last one will sometimes get as much fish as the first. It is all up-tiller for one and down-tiller for the other.

8430. What distance might they be trawling from one another?—Sometimes they are like as if they were in a line. There is a place we trawl over that we call "New Ridge"; we trawl there right through a gut, and we often find that the last smack will get as much as the first.

8431. Is that gut known to the fishermen?—Yes, it is very well known.

8432. How far is it from the shore?—About half a mile. It is just on this side of Dartmouth Harbour, between Dartmouth and Burnhead.

8433. How long have you been in the habit of fishing there?—My grandfather, I should presume, fished there.

8434. Speaking within bounds and without any exaggeration, can you tell me how long your experience of that fishing ground extends?—I have had nearly 20 years personal experience of it, but there are many men 70 years of age who have been at it all their lifetime.

8435. In your experience of 20 years have you found that you have caught as much fish in that gut during the last year as you did in the first?—At different times and different seasons we have got quite as much. The sea is just like the land, at some seasons there are poor crops and at others there are good ones, and so it is with the fish; in some seasons the shoals of fish come in and at others they don't.

8436. Has that place been very much fished?—Yes.

8437. And it is still fished?—Yes, every year.

8438. Do you get as good fishing there now as you did formerly?—Yes.

8439. There has been no marked falling off?—No.

8440. Do you get flat-fish and soles there?—Yes, right in the gut.

8441. Are they as numerous there as they used to

be?—There may have been a little falling off in flat-fish and soles.

8442. But with regard to the general take, is it as good as it was formerly?—Yes.

8443. Is there any other ground equally worked on which the fishing has been pursued for many years?—Yes.

8444. Where is that?—It is what they call the "in-ground".

8445. Where is that?—Just off the bay.

8446. How far from the shore?—About three miles.

8447. Is that deep water?—You may call it deep water; it is from 15 to 20 fathoms.

8448. Have you known that in-ground for many years?—Yes, all my lifetime.

8449. Is it being fished upon now?—Yes, every year it is constantly dragged.

8450. Are there as many vessels fishing upon it now as there were 20 years ago?—Yes, and more.

8451. Does it yield as good a take of fish now as it did 20 years ago?—Yes, at times and seasons.

8452. There has been no marked diminution?—No, except in the class of fish I have mentioned.

8453. Has there been any marked increase?—No.

8454. Then it remains stationary? — At certain times we get great takes of whiting there.

8455. You have 80 vessels engaged in the fishing trade in this place?—Yes.

8456. Then, according to your theory, if there were 80 or 100 vessels fishing on that ground would they all get fish?—I presume they would.

8457. There would be no chance of their exhausting it or running it out?—I don't believe there would.

8458. You have seen no signs of that?—No, and when I come to look at the quantity of smacks we have and the increase of capital put into the trade, I cannot help thinking that it must have been a very good business. We have got all sorts of trades here invested in it, the sailmaker, the blacksmith, the rope-maker, and the carpenter, so that there must have been something like made out of it.

8459. Are they all doing well?—Some are unfortunately bankrupt before they begin; there are a good many of that sort and that is a misfortune, but I think as an investment the thing would pay if we were to have it a little organized. I have made it pay myself.

8460. It depends a good deal upon management, like any other business?—Yes, nine-tenths of it.

8461. Is the quality of the fish you take now as good as it used to be?—Yes, it is quite as good.

8462. Is the size of the turbot as large as it used to be?—The turbot are quite as large and as good in quality.

8463. Does that apply to all the kinds of fish you have been in habit of catching?—Yes, last Saturday we had an immense show of fish in the market, of turbots and John Doreys especially.

8464. What quantity on the average will be brought ashore here in a good day's fishing?—You may put it down at 50 tons.

8465. Of that 50 tons what proportions are there of different kinds of fish?—I don't understand you exactly.

8466. Take the whole 50 tons, how many tons would consist of soles?—Soles will run to about three quarters of a cwt. for 80 smacks on the average, say 1 cwt. on the average.

8467. Is that for each smack?—Yes.

8468. That would be 4 tons out of the 50?—Yes.

8469–70. How much turbot will there be?—The turbot will average, when we have a good catch, about three fish a smack, say 20 lbs. a smack.

8471. That will be about three-quarters of a ton?—Yes.

8472. What proportion will there be of haddocks?—They are very scarce with us. We do not reckon upon having more than one or two in a boat.

8473. What is the next?—Hake.

8474. What will be the quantity of hake?—That will depend on the season of the year; will you take the average?

8475. Yes.—Put them down at about 5 cwt. a boat.

8476. About 20 tons?—Yes.

8477. What else have you?—We have gurnet.

8478. What would be the quantity of gurnet?—You may put them down at 2 cwt. a boat.

8479. What is the next kind?—Whiting.

8480. At about what do you put them down?—Half a cwt. a boat.

8481. What is the next?—Flat-fish and cod and ling. You may sum all that up together and put them down at half a cwt. on the average.

8482. But you have not got up to 50 tons yet?—But where are all the rays? We have abundance of rays here; we have not got the brills, the doreys, and red mullets.

8483. They will make up the rest?—Yes, then there are the rays and skate.

8484–5. How many of them are there?—We have great quantities of rays. I should say three dozen a boat.

8486. Are there as many skate as brill, doreys, and red mullet put together?—Yes.

8487. Then there would be about 3 tons of each?—Yes, there are more than that, but that is near enough.

8488. Are the skate falling off, or are they increasing?—I don't think they fall off.

8489. Are you quite certain upon that point?—Yes.

8490. In the northern fisheries they find the skate falling off?—We do not. I am sorry to say that we catch too many at times. We have not got a market for them.

8491. Have the haddocks fallen off?—We cannot account for the haddocks on this coast. There is no certain season in which we catch them here.

8492. It never was caught much here, was it?—It has been one or two seasons.

8493. But on the average the catches have not been great?—No.

8494. You do not notice any particular increase or decline in that fish?—No.

8495–6. Did you ever bring up any spawn in your drag net?—I have seen a little about my net in my day. It hangs about the meshes of the net. I cannot say what kind it is.

8497. Are you acquainted with the markets for fish?—Yes.

8498. I think you said that for seven years you have been a salesman?—I have not been a salesman for seven years, but I have been on shore that time.

8499. How many years have you been a salesman?—I have only been a salesman nine months.

8500. Then you cannot speak as to the comparative price over any long period?—I was a buyer previous to that.

8501. How long did your experience as a buyer extend?—About 15 years.

8502. Have you found during those 15 years that the price of fish has materially increased?—No, I think it is pretty much the same as it was 15 years ago.

8503. Fifteen years ago I suppose you had railway communication?—Yes. Perhaps you will allow me to say that I found the fish last year, in 1862, fetch as high a price as ever was known.

8504. How has it been this year?—It has fetched a high price this year too. Since the railway communication was opened we have had additional facilities for getting the fish into different towns and markets.

8505. In the course of your experience can you tell us on the whole what quantity of fish may come to this port in a year?—I cannot tell that exactly.

8506. Or whether on the whole it has increased or diminished?—I should think on the whole it has diminished, if you take all classes.

8507. Do you think there are fewer fish caught here by the larger quantity of boats than were caught formerly?—Yes.

8508. On the whole?—Yes, on the whole.

8509. What do you think is the reason of that?—

BRIXHAM.

J. Salter.

10 Oct. 1863.

I attribute it to dragging in the shallow waters about here.

8510. Do you mean the quantity caught here, or the whole quantity brought in?—I am taking it either way.

8511. But if you have more boats you may have as many fish brought in, although each may bring a smaller quantity?—If you go into figures you will find there have been larger nets, larger beams, that our vessels are larger in tonnage, and that we drag in a six hours' drag over two or three miles more ground during the time.

8512. Well, they ought to catch more fish, ought they not?—They ought, but I think there is not the quantity of fish that there was formerly on the whole.

8513. I think you said that you yourself had not practised line-fishing?—No.

8514. Do you know anything about the herring fishery here?—No, but there are men in the room who can tell you all about that.

8515. Do you know anything of the mackerel fishery?—No.

8516. Do you ever cure any of the fish on board at such times as you cannot bring them ashore?—Only just a little for present consumption and for our families.

8517. Generally speaking you can bring the fish ashore in a fresh state?—Yes.

8518. You have no wells on board?—No, we have no wells and no ice.

8519. Do you think it would be of advantage to have ice?—I think it would.

8520. The system pursued by the Hull fishermen is to have ice?—Yes.

8521. They have derived advantage from it?—Yes.

8522. Do you not think that you would have the same advantage here?—I don't know. We should have to organize the matter first.

8523. They have found it pay well at Hull?—The fishermen themselves objected to it years ago.

8524. Did they object to use ice?—Yes.

8525. Why did they object?—They thought the owners were going to usurp and tyrannize over them, and keep them at sea.

8526. Is that the feeling now?—Pretty much so.

8527. Is that the reason that ice is not used?—There is not so much necessity for it here as at Hull. We do not fish so far away from the coast. We can get the fish to the market at Bristol, Portsmouth, Plymouth, or somewhere.

8528. Have you ever considered the propriety of adopting that plan?—I have as an individual.

8529. Has it not been generally considered?—It has not been mooted generally, but two or three of us have privately considered it.

8530. (*Professor Huxley.*) Did you hear the regulations I read just now?—I did.

8531. Did you ever hear of them before?—Yes, but I am sorry to say that I never observed them.

8532. Have you had anybody to bring you to book?—I never have been brought to task for not observing them.

8533. Was your father a fisherman here?—Yes.

8534. Was your grandfather?—On my mother's side; but my grandfather on my father's side was a tailor.

8535. I think you spoke of your grandfather just now?—I did not mean my grandfather; I meant the old gentlemen who follow it.

8536. Have you any notion of the time when trawling was first practised here?—No.

8537. It is a very long time since it was first practised?—Yes, may be from the time of Moses. I question whether you could get any account of it. The Torbay trawlers have gone all through the world.

8538. Are you in the fishery club here?—Yes.

8539. There are about 150 vessels insured in that club?—Yes.

8540. About 80 of them fish off this coast?—Yes.

8541. Then what becomes of the rest?—In the summer season about a dozen of them will go to South Wales and Tenby.

8542. No more than that?—No, about a dozen or 15. Then about a dozen or a score will go up on the Kentish coast next month—to Ramsgate, and perhaps half a score will go to Hull.

8543. Do they come back in the winter time?—No, in the summer. The South Wales men are coming back now. They are now arriving.

8544. The north countrymen come down in the summer?—Rather in the spring.

8545. The South Wales men come back in the winter?—Yes, at the fall.

8546. How long do they remain at home?—All the winter, until the month of May.

8547. Cannot they catch fish in the Bristol Channel in the winter?—No, it is only a wild place for them then.

8548. Are there no harbours there?—No.

8549. Is Tenby the only harbour they have?—Yes.

8550. That is a tidal harbour that they cannot always get into, is it not?—Quite true.

8551. Then do they stop there?—A few remain there.

8552. Do they bring the money they earn aboard and spend it here?—Yes, a little of it as it were—what is called the overplus.

8553. When did the system begin of vessels going to other places for the purpose of trawling?—I do not know the date.

8554. Was it before your recollection?—Yes. Perhaps there are one or two old gentlemen here who can answer that question.

8555. Do you think the number of trawlers here has increased since they went away?—Do you mean the increase in the numbers and size combined.

8556. Has the number that fish off the coast here increased?—Yes, a trifle.

8557. Notwithstanding the number of vessels that have gone away?—Yes.

8558. Then they have not gone away because the fish were scarce?—We have more vessels now fishing here on this coast all the year round than we had formerly, taking the whole year through, summer and winter.

8559. Do the crews of the vessels live largely upon trawled fish?—Yes, chiefly.

8560. Did you ever hear of their being made ill by doing so?—No; we get it pure out of the water, and into the pan it goes.

8561. Did you ever hear of fish being rejected or account of being damaged?—I never reject any.

8562. All is fish that comes to your net?—Yes.

8563. When you were a fisherman had you ever occasion to throw much overboard on account of its being damaged?—No, unless we get a large rock or stone in our net that would mangle the fish if we had a strong wind.

8564. But under ordinary circumstances?—No; if we make a good haul there may be one or two.

8565. Are many dead?—No; we may get hold of a monk or a buffoon, or something like that.

8566. What do you call a buffoon?—It is a wide thing.

8567. Is it an angler fish?—Yes; we have no market for that.

8568. Then you do not care to get it?—We have no sale for it, or for the monks either. We may sometimes get a blind cod, or a fish that has been wounded, or a dogfish, or something of that sort.

8569. But from your answer I judge that the proportion of fish damaged in that way is very insignificant?—Quite so.

8570. Is any proportion of the fish you take in your trawl in the deep sea so small that you are obliged to throw it overboard?—Yes, we sometimes get a few little gurnets.

8571. Do you get any small turbot or soles?—No, never.

8572. How do you account for that?—We imagine they come to the shoals to spawn, and go off, when the cold weather comes, into deep water. By that time they are about two thirds grown.

8573. Then except gurnets and the like you have no proportion worth speaking of that you reject on account of their being small ?—No.

8574. Is there any difference in the quality of the hooked fish as compared with those caught in the trawl ?—There is a difference in the brightness of the fish at times.

8575. Can you as a fish salesman get a better price for hooked fish ?—No, only for hooked whiting.

8576. Why is that ?—There is a good deal of prejudice. Some people are tickled with a little fancy, and they like to see a thing bright.

8577. Can you tell the difference between a hooked whiting and a trawled whiting ?—Yes.

8578. Can you tell the difference between a trawled sole and a hooked sole ?—No. I never saw a hooked sole in my life.

8579. Can you tell the difference between a hooked turbot and a trawled turbot ?—No, I cannot.

8580. Do you agree with the previous witness that the quantity of soles is falling off here ?—Yes, I do.

8581. Can you account for it ?—I can only account for it by the fishing in shallow water in the bays and creeks, and by the drag nets dragging off our shores.

8582. (*Mr. Caird.*) Are they building as many vessels now as they have been in recent years ?—Not at present.

8583. What is the cause of the present suspension in building operations ?—There was a little failure in the business last year.

8584. Was it a failure occasioned by over-building ?—Yes.

8585. There were too many vessels built for the requirements of the trade ?—Yes, too many.

8586. And what was the result ?—They became bankrupt in the business ; the consequence of which has been that there have been no vessels built since. There has been two or three built, but they have not been purchased. They have been built on spec, not ordered.

8587. As one consequence of the bankruptcy, and the trade being overdone, there has been a pause in the increase ?—Yes, and it will remain so until it finds its level again.

8588. Are you aware whether, in consequence of the issue of this Commission, there has been any suspension of the building of vessels or the making of nets ? You make nets, I believe ?—Yes.

8589. Have you ceased to make nets ?—I have ceased to make nets for the last six months, ever since I saw a report of a meeting held by our Northumberland and Durham friends in regard to this trade and the deep-sea fishery. Instead of getting prepared, as I have done for seven years in the winter, with a stock of nets, I have now run out, and I am just keeping from hand to mouth.

8590. Did you apprehend that there was to be some regulation as to the size of the mesh ?—I apprehended there would be an alteration in the size of the mesh.

8591. Do you think that such an alteration is called for ?—I think it would be of benefit to the fishery.

8592. Did you think that this inquiry would lead to an alteration in the size of the mesh ?—Yes.

8593. Do you think the size of the mesh should be enlarged ?—Yes.

8594. To what size do you think it would be proper to enlarge it ; I mean the cod end of the net ?—That is the smallest scale.

8595. The present size of the cod of the net is about one inch from knot to knot ?—Yes.

8596. Do you consider that too small ?—Yes, it is too small.

8597. Why do you find it too small ?—We get the very small whiting and the very small red mullet, and it chokes as well, and prevents the net being drawn along lightly, as we wish to have it.

8598. Is that through the smallness of the mesh ?—Yes.

8599. (*Professor Huxley.*) The law as it at present stands is this : " Trawls shall be made with nets " the meshes of which shall be at least one inch and " three quarters square, from knot to knot, along the " line " ?—One inch and three quarters ?

8600. Yes. The net you have shown us is an illegal net ?—Yes.

8601. (*Mr. Caird.*) This net is smaller than the law authorizes it to be made ?—Yes, it is smaller.

8602. Are you aware that that is illegal ?—Yes.

8603. Do you desire it to be enlarged ?—Yes.

8604. To what size ?—1½ inches, I should think, would be sufficient.

8605. And so strong is your belief in the necessity of that, that when this inquiry was issued you suspended making nets until you could see the result ?—Yes.

8606. In the belief that some such regulation would be made ?—Yes.

8607. (*Professor Huxley.*) But the mesh you recommend would also be illegal ?—Yes.

8608. All the nets you have now might be seized ?—I believe there is not a trawler whose nets might not be seized.

8609. (*Mr. Caird.*) Do you believe that the existing law could be enforced ?—I think 1¾ inches is rather too large.

8610. Why do you think so ?—On account of catching the red mullets.

8611. Would large sized soles go through a mesh 1¾ inches from knot to knot ?—A fair-sized sole would. I presume you take the square from knot to knot.

8612. Yes, from knot to knot ?—What would that make round the hole ?

8613. (*Professor Huxley.*) Seven inches.—A large sole would go through that.

8614. (*Mr. Caird.*) Then you think 1¾ inches would be too large ?—Yes.

8615. What size do you think would be the proper size ?—1½ inches.

8616. Is it the case with other fishermen that they have also suspended the making of nets under the same belief as yourself ?—Yes, that is my conviction ; and I am in company with numbers more or less day by day.

8617. Were you aware that you were making illegal nets ?—I was aware of it.

8618. Do you think the fishermen are aware that that they are using an illegal net ?—Yes.

8619. Nobody having interfered they have pursued that system ?—Yes.

8620. And yet you believe that it is contrary to their own interests ?—Yes.

8621. Why is it contrary to their own interests ?—I may bring three baskets to your one, in consequence of my meshes being smaller than yours, and that will affect the price a little. It will probably only bring me one-third more for my day's take than you get.

8622. But you would get a much larger proportion of immature fish ?—Yes.

8623. You think it better for all concerned that so large a proportion of these small fish should not be caught ?—Yes, I think it would be better for all concerned.

8624. (*Professor Huxley.*) Instead of the law remaining a dead letter, as it has done, do you think it would be of advantage to the fishermen, and to the supply of fish, that the regulations laid down here should be enforced by some persons in authority ?—Yes.

8625. Suppose a Government vessel were here to look after your vessels, and see that the beam was not above a certain size, and the mesh was not below a certain size, do you think that would be good for the whole fishery ?—I think it would ultimately.

8626. You heard the rules I read ?—Yes.

8627. Perhaps I had better take them specifically. First, with regard to the size of the nets, the Act of Parliament says : " Trawls shall be made with " net the meshes of which shall be at least one inch " and three quarters square, from knot to knot, along

BRIXHAM.

J. Salter.

10 Oct. 1868.

"the line;" do you think it would be a good thing to enforce that regulation?—No, that is rather too large; 1½ inch, from knot to knot, along the line, would be enough.

8628. The next article says, that the length of the beam shall not be more than 38 feet. The words are these: "The length of the wooden yard or beam, to "which the upper part of the mouth of each trawl-"net shall be fastened, shall not exceed 38 feet;" do you think that that is a good rule to enforce?—That would depend considerably on the length and size of the smacks.

8629. In point of fact, if that were enforced it would prevent you from having smacks above a certain tonnage?—Yes, it would.

8630. You think that would not be advantageous to your fishing?—No, it would be rather against it.

8631. Then there is another rule: "The under "trawl net, to a length of 10 feet from its extremity, "may be strengthened by rubbing pieces made of old "nets; but these rubbing pieces shall be so fastened "that they shall not cross or narrow the meshes of "the trawl net, which must always remain at least "one inch and three quarters from knot to knot, along "the line, open and unobstructed." Are you in the habit of fastening rubbing pieces of this kind?—Yes; they are what we call "false bellies". We only lace them on, that is all, and we let them fly like wings.

8632. Then, in fact, you comply with the law?—Yes.

8633. Have you any supplementary nets added to your trawls?—No.

8634. The article says: "The size of the meshes "of any supplementary nets which may be added to "trawls shall be at least two inches square, from knot "to knot, along the line." You say you don't use them?—No.

8635. Another article says: "The total weight of "the two irons or head pieces of a trawl shall not "exceed 287 lbs." Do you think that is a good rule to enforce?—Yes, I do.

8636. Why?—Because I think that above that weight they have a tendency to work against us.

8637. Why?—With the pressure of the weight, and the size of the smacks, we should be dragging everything to pieces.

8638. Then you think it would be well to interfere with that matter by law?—I do.

8639. Why do the fishermen use heavier head irons than they want?—Because Jack wants to run ahead of Tom sometimes.

8640. But why should he use heavier head irons, that would keep him astern?—We go by our own judgment. I, with my smack of 60 tons, may require heavier irons then you with your smack of 40 tons, because I drag my heavier irons with a little more speed than you, and my heavier irons will keep down if I am running ahead of you. It is to my advantage to drag up more than you.

8641. So that the larger the tonnage of the vessel, the heavier the head irons you can use with advantage?—Yes, in proportion. That is the rule.

8642. Then does it not follow, with the weight of your trawl and the length of your beam, that that would act as a limitation on the speed of the smack?—No.

8643. If you use lighter head irons would not the net drag faster through the water?—Yes; but we want to know at what rate we are dragging, and what fish we are getting at the speed.

8644. Suppose you have a smack of 60 tons, will you not drag faster through the water with the same head irons than a small smack?—Yes.

8645. Then will you not want heavier head irons?—Yes.

8646. Then, if you are not allowed to use for a smack of 60 tons heavier irons than a smack of 40 tons, would not that interfere with you?—Yes, considerably.

8647. Then, under these circumstances, would you like to see that rule enforced?—I am not one of those who go to the north.

8648. But suppose it were enforced in the south?—I believe that having large smacks is against us. I believe that a smack of 45 tons is quite large enough for this port.

8649. Then why would you enforce the regulation on other people?—They are quite at liberty to use heavier head irons, but they will run themselves out in the course of time.

8650. Do you think it would be right for the Government to interfere with the size of the plough a man may use?—No, not in the least.

8651. Here is another rule: "The total weight of "iron chains or leads used for loading the ground "rope of a trawl shall not exceed 110 lbs." I understand that you use no weight on your ground rope?—No.

8652. Then that does not matter to you?—No.

8653. What do you think of this rule: "Trawl-"fishing is forbidden in all places where there are "boats engaged in herring or mackerel drift-net "fishing"?—If I understand the drift-net fishery, the herring and mackerel boats heave in at sunset, and heave out at sunrise. Is not that the case.

8654. Yes, half an hour before sunset?—We should not interfere with them then.

8655. Don't you trawl at night?—Yes.

8656. Then how would you not interfere with them?—We get out of the way of them.

8657. You do that as a matter of preference?—Yes.

8658. But should you like this regulation to be enforced if it would keep you away from the ground?—Yes; I should not object to it.

8659. Why not?—Because then they have a chance of getting a livelihood as well as us. Why should we want both night and day. We have got all day to work in, but it is of no use to them.

8660. Then there is another rule: "Trawl-boats "shall always keep at a distance of three miles from "all boats fishing for herrings or mackerel with drift-"nets." Would you like that to be enforced?—Yes.

8661. You would not mind, supposing you were trawling, and had got your trawl down, and the herring nets came upon you, taking up your trawl and going away?—We should haul up, and get out of the way.

8662. You would not mind that?—No, I should not myself.

8663. On what ground would you not object to it?—For instance, they may be drifting off the Start, and we are there trawling. We can get a chance of catching fish by day as well as by night, though we like night best. Now these men only get the night. Then why should we monopolise the ground by night as well as by day. We like to give Jack a chance as well as Jim. Live and let live, I say. And then we can trawl when it is not weather for them to drift. We have there another advantage in the weather. Then again there are only certain months in the year for their drift-net fishery on the coast.

8664. Quite true. Then, in fact, you have no objection to this rule which obliges you to give way to the drift-nets?—Not the slightest.

8665. And if your trawl was down, and they shot their nets near you, you would not object to take it up again?—I should haul it up, and get out of the way.

8666. There is another rule about trawl-boats here, that they shall carry vanes at their masthead. Is that the practice here, commonly?—No, it is not practised.

8667. The British trawl-boats are to carry red vanes; do they do that?—No. Some of them may.

8668. They do just as they like?—Just as they like.

8669. Then am I to understand that generally you would rather prefer to have a fishery officer to look after you, and see that you obey the regulations, than be left to yourself?—Yes, I should.

8670. You do not think that you understand your own interests sufficiently to be left alone?—No; we want a school to teach us. I do, for one, I know.

8671. (*Mr. Caird.*) Do you find that the herring fishermen follow the trawl-vessels ?—They do, at times.

8672. Is that in the expectation of getting on the ground where the herrings are, in consequence of the trawl-vessels being there ?—No.

8673. In what way then ?—If we are fishing out in the bay in their season they come there.

8674. But do they not come because you are there ?—No.

8675. Do they not expect to find more herrings where you are ?—No.

The witness withdrew.

HENRY SALISBURY called and examined.

8676. (*Mr. Caird.*) Have you been long engaged in the trawl-fishing ?—Yes ; 29 years.

8677. Are you still engaged in it ?—Yes, up to this day.

8678–80. Both as a fisherman and as an owner of a trawl-vessel ?—No, not as an owner.

8681. What size is your vessel, the vessel in which you fish ?—35 tons new measurement.

8682. In your experience has the general size of the vessels employed in the trawl-fishing increased?—Yes, I think it has.

8683. And has the size of the trawl been increased ?—Yes, decidedly it has.

8684. Do you remember what it was 20 years ago ?—Yes.

8685. What was it ?—From 30 to 33 feet, and now sometimes it is 43 feet ; it has increased in some cases more than 10 feet in length.

8686. With regard to the size of the mesh, has that diminished ?—No, it is about the same.

8687. There has been no change in the mesh during that period ?—Not in my recollection.

8688. The increase in the size of the trawl has gone on I suppose along with the increase in the size of the vessel ?—Decidedly it has.

8689. And it corresponds with it ?—It corresponds with it.

8690. Do you find that you get a larger haul with these larger nets than you used to get 20 years ago with smaller nets ?—At certain seasons of the year we do.

8691. Have you observed in your experience a considerable increase in the number of vessels fishing on the same ground ?—Yes.

8692. Is each vessel as successful now as it used to be in former times ?—I do not believe that they have been as successful within the last three or four years.

8693. Has there been a falling off in the last three or four years ?—Yes, there has.

8694. Has that been among all kinds of fish caught?—Only some portions.

8695. What kind particularly ?—The soles and the flat-fish.

8696. Has the falling off been considerable in that kind of fish ?—Yes, it has within the last five years past.

8697. What do you think has been the cause of that ?—The only cause of it, so far as I can imagine, is the trawlers fishing in the bay.

8698. Did they not fish in the bay previous to five years ago ?—Yes, they have fished here off and on ever since I have been fishing here.

8699. Was there no perceptible decrease up to five years ago, notwithstanding that they fished there ?—I can mind the time when there was a great deal of fish caught in the bays ; double the quantity compared with what is caught now.

8700. Do you think that by constant trawling in the bays the quantity has decreased ?—Yes.

8701. You say you only observed the decrease about five years ago ?—Yes.

8702. The decrease only began five years ago ?—The decrease in the deep fishery has only been during the past five years.

8703. Then you have observed a decrease in the deep-sea fishery ?—Yes, greatly.

8704. Can you say the extent it has decreased compared with what it was formerly ?—I cannot say to what extent, but in the last five years what we call the "in-ground" fishing here has greatly diminished ; there has not been so much fish caught by one third as there was before.

8705. Do you ascribe that to the trawling in the bay and in-shore ?—Yes.

8706. In what way does the trawling in-shore injure the fishery ?—By taking the young fish. I believe the mother fish goes in there to spawn.

8707. Have you ever seen any spawn in the trawl nets ?—Never.

8708. Then do you think it is by injury to the spawn that the damage is done ?—No, I think the fish comes to perfection before it is hurt.

8709–10. You think the damage is not done to the spawn itself ?—I think not.

8711. And that the injury is done by catching the small fish ?—Yes.

8712. Have you trawled much in-shore?—I trawled as much for two years running at one time as any man going, but I have not done so during the last three years.

8713. When you were in the habit of trawling in-shore did you catch a great quantity of fish ?—Yes, a great quantity.

8714. How many baskets of fish would you, on an average, catch in a day's fishing ?—Sometimes I have had four or five baskets, sometimes three or four.

8715. How many would be small fish ?—On an average about one out of five.

8716. About one fifth of the whole catch ?—Yes.

8717. Were these small fish unfit for the market ?—Decidedly they were, and they were chucked overboard.

8718. Were they dead ?—Some were dead, and some were alive.

8719. When you are fishing in the deep sea do you find that you get as large a proportion of small fish ?—No, not a quarter.

8720. Have you found that the quantity of turbot caught here is decreasing ?—No.

8721. Is it as good in quality ?—Yes, it is as good in quality as ever.

8722. Is there any other fish except flat-fish and soles that you have observed falling off in quantity ?—No, there has not been so much falling off in any fish except flat-fish and soles.

8723. How do you think that could be remedied ; what would be the plan to adopt for preventing that decrease ?—I think if the Government were to establish a regulation keeping all the trawlers out of the bays for eight months in the year, and likewise the drag seines, there would be an increase in the quantity of fish.

8724. You would keep the trawlers out of the bays for eight months in the year ?—Yes.

8725. What eight months?—From April to October.

8726. Then from October to April you think no damage is done in the bays by the trawlers?—No, not from October to April.

8727. In the cold weather ?—Yes.

8728. Is it because there are very few young fish there then ?—Yes, I think the small fish go to the deep sea when the cold weather comes.

8729. You think it would not injure the fishery if the fishermen were allowed to trawl in the winter months in-shore ?—I do not think it would.

8730–1. But in the summer months you think they should be excluded from trawling in-shore ?—Yes, this summer I have been fishing at Rye Bay between Dover and Hastings ; there is shallow water there and deep water also; it runs from 18 fathoms to 4 fathoms. It is not often that we do go into shallow water if we can help it, but we are sometimes

BRIXHAM.

H. Salisbury.

10 Oct. 1863.

compelled to do so, and then we get a tremendous lot of fish that is not saleable at all; we heave it overboard as fast as it comes on board.

8732. Is that in consequence of its being too small?—Yes, as soon as we get in deep water we get fish that is saleable in any market; the ground there goes off gradually from 10, 11, 12, and 14 fathoms, up to 18, all within four miles and a half of the shore.

8733–4. Then you think that the destruction principally takes place in shallow water and in the warm months of the year?—Yes, it is about the warmest time of the year.

8735. Would you think it any hardship to exclude the trawlers from coming in-shore to fish during those months?—No. I would not let them fish in-shore during eight months of the year.

8736–7. You would exclude them for eight months?—Yes, I think that would be a great benefit to the whole of the fishermen.

8738. Is the quality of the fish you catch now quite as good as it used to be in former times?—Yes, quite as good.

8739. Is the size of the fish as large as it was formerly?—Yes, it is quite equal.

8740. Have you observed any particular fishing ground that you have been in the habit of resorting to for many years, which has been constantly fished over by the trawlers without injuring it?—Yes.

8741. Is there any fishing ground you can name?—The only place I can name is here at Brixham. I have not been away a great deal.

8742. Is that a place called the "Gut" to which a former witness referred?—No.

8743. Is it the in-ground off Dartmouth?—Yes.

8744. Is that the ground to which you refer?—The in-ground is just off here.

8745. I thought you meant the ground off New Ridge, but it is the in-ground off here you speak of?—Yes.

8746. Have you observed any decrease in the quantity of fish except flat-fish and soles, which you say have fallen off?—Not as a general rule.

8747. You do not think that you have fished out that in-ground?—No.

8748. It has shown no signs of being fished out?—No, we go out on a Monday morning and we fish that ground and find as much on Friday night as we did on Monday morning, and we are fishing all over the same ground the whole of that time.

8749. You have not observed that you have nearly fished the ground out?—No; I think the fish at times have a great deal to do with the tides.

8750. In what way?—When the tides run strong we catch more fish than when the tides run weak.

8751. Is it from a variation in the tides and other circumstances that there is an occasional difference in the quantity of the fish, and not from the fact that the fish have disappeared altogether?—Yes; the variation of the tides has a great deal to do with the quantity of fish we catch.

8752. Have you fished on the Dutch coast?—Yes, for four years.

8753. Is that lately?—Seven years ago.

8754. Do you find that the fishermen there use much the same kind of trawl that you do?—Yes, it is about the same length and size as ours, only it is of a different shape; that is all. The trawl irons have a different shape.

8656. But do they use a trawl?—Yes, they use a trawl like ours.

8756. Do you know whether the meshes of their nets are smaller than yours?—That I cannot tell.

8757. Did you find any complaint on that coast that the fish had gradually fallen off in consequence of the use of the trawls?—In some seasons you may find a scarcity, but in others there is an abundance of fish.

8758. Have you ever used ice in packing your fish, so as to preserve them and enable them to be sent ashore fresh?—No.

8659. Do you often lose fish from the want of the means of preserving them in bad weather?—That does not occur once in twelve months on this coast.

8760. Have you been on any coast where there has been a greater risk of damage?—Yes, in the North Sea.

8761. Was there such a difference in the risk as to make it necessary to use ice?—Yes, in the spring time of the year.

8762. You have not had the same difficulty here?—No; it has not occurred here at all.

8763. Have you ever fished on the Dogger Bank?—No.

8764. In the Silver Pits?—No; I have never been so far down as that. I have only been down off Yarmouth and Lowestoft.

8765. Are you paid by the share?—Yes.

8766. Is that system of payment by share the common system practised here?—Yes, right through the whole fishery.

8767. There is no such thing as paying wages to the men?—No, not at all.

8768. Does the share give you a good livlihood?—Yes it does. It has been sufficient for me, although it has been very slack lately.

8569. Do you know that it is a fact that within the last year there has been an increase in the number of vessels here?—Really I can hardly tell.

8770. Have there been any new vessels built?—Yes, decidedly.

8771. Has the number been increasing in the same proportion as during the preceding five years?—Yes, it has been nearly about the same.

8772. Has there been a stop at all in the increase?—There has been no stop at all in the building, not as yet.

8773. Has it been on the whole a prosperous business?—I believe it has with three parts of the people engaged in it.

8774. There have been some exceptions?—Yes, there are a great many who meet with misfortunes, and then they cannot go a-head like the others. They lose their craft, and so on.

8775. You heard the evidence of the previous witness with regard to the size of the meshes of the cod of the net?—Yes.

8776. Do you agree with him that the present size should be enlarged?—Yes, in a certain part of the net the smallest mesh should be enlarged.

8777. What size do you think would be the proper size to adopt?—Two and a half.

8778. Two and a half inches from knot to knot?—No, not from knot to knot, I would have one knot between.

8779. That would be $1\frac{3}{4}$ inch, the legal size?—Yes, but they have them smaller than that now.

8780. Do you think it would be of advantage to the fishermen generally that the legal size of $1\frac{3}{4}$ inch should be adopted?—Yes.

8781. Do you think it would be of advantage to the fishermen, as well as to the general take of fish, that such a regulation should be enforced?—Yes, decidedly. I should prefer it for my own part, and I know scores of fishermen, nay hundreds, who would.

8782. Is there any other subject on which you think it desirable that some regulation should be enforced, as to the length of the beam, for instance?—No, if the beam were reduced there would be a great deal of danger to the men and the vessels at times. It would do considerable damage to shorten the beams that are carried by the large vessels.

8783. Then you think it right for every man to take what size of beam he thinks most advisable for his own vessel?—Yes.

8784. You would limit the regulation to the size of the mesh?—Yes.

8785. Do you ever come in contact with the long-line fishermen?—No, never.

8786. Have you never fouled their lines?—No.

8787. Are you at all engaged in the herring-fishing?—No.

8788. Did you ever foul the herring nets?—No, but

BRIXHAM.

H. Salisbury.

10 Oct. 1863.

I have been foul of the mackerel nets, and I think that is all the same.

8789. Have you done them much damage?—At one time I did a great deal of damage.

8790. Could that have been avoided?—Yes, i could have been avoided by the mackerel boat, or else they would have carried on a lawsuit against us.

8791. Did they sue for damages?—No.

8792. How did it occur?—The mackerel boats when they drift their nets, are bound to wear two lights; now, she had only got one up, and we thought it was a square-rigged vessel, and that is how we caught the nets. It was entirely owing to her not having two lights up.

8793. You were misled by her not having proper lights?—Yes.

8794. You were not liable, then, for the damage done?—No.

8795. If the mackerel boat had had proper lights could you have avoided it?—Yes, without heaving our net up; we could have turned our vessel about the other way.

8796. Then you do not think that any other regulation on that subject is required?—No, I do not think there is.

8797. Have you ever in your experience been able, when at sea, to aid vessels in distress?—Yes, many times. I have been the means of saving nine lives in the North Sea, floating on the water.

8798. Do you think the trawl-boats are often serviceable in that way?—Decidedly they are.

8799. Are they good sea boats?—There are none better.

8800. And they are easily managed at sea?—Yes, they are very easily managed.

8801–2. And in that way you render service in a time of danger?—Yes. I have been three times up the Channel with big ships,—the biggest kind of merchant ships. I have had to pilot them up.

8803. Is the catch of skate falling off here?—No, I think it increases of the two. At certain times of the year we get very large catches.

8804. Have you any knowledge of the crab, lobster, and oyster-fishing?—No.

8805. (*Professor Huxley.*) Do you catch many haddocks about here?—No, I hardly see a haddock in 12 months.

8806. Are they scarcer than they used to be?—I can hardly recollect any time since I have been fishing here that I have had any great quantity. There were two seasons in which I got some.

8807. They never seem to have been very abundant here?—No.

8808. Do you know a fish they call the "pollack"?—Yes.

8809. Do you get it in considerable numbers?—No, it is very unfrequent that we catch any.

8810. What was the average yield of a trawl-vessel 20 years ago?—That is out of my remembrance, I was only a lad then. I can only tell you what has occurred since I had my own earnings.

8811. How long ago is that, is it 15 years ago?—No, about 14 years ago.

8812. What was the average yield then?—It averaged during the first two years I was out of my time 1*l.* 5*s.* a week.

8813. Was that the average wage of each man in the summer?—Yes, barring the master.

8814. What is the average rate of wages now?—For my own part I know that I have not taken up myself during the last two years more than 15*s.* a week, and I have a master's wages too now.

8815. Of course, if you are paid by share, your earnings are regulated by the price of the fish?—Yes.

8816. Is the price of the fish lower than it was formerly?—It is better at times now than ever it was.

8817. So that the loss you have sustained does not arise from the decrease in the price of the fish?—No, not at all.

The witness withdrew.

JAMES BOWDEN called and examined.

J. Bowden.

8818. (*Mr. Caird.*) How long have you been a fisherman here?—I have been at it for about 19 years.

8819. Are you still employed as a fisherman?—Yes.

8820. Have you any share in the vessel in which you fish?—Not at all.

8821. In the course of your experience have you noticed whether the quantity of fish you catch here now has increased or diminished, as compared with what it was when you began fishing?—I think it is better now than it was 14 or 15 years ago.

8822. What would you consider a fair catch of fish in the course of a week 15 years ago?—I consider now that the money I make is more than it was 15 years ago.

8823. Can you tell us the quantity of fish caught then, and compare it with the quantity caught now either in the course of a day, a week, or a month?—It varies according to the time of the year.

8824. But in each case take the same time of the year?—There are more fish caught now in the winter time than there used to be.

8825. What would be an average day's fishing 10 years ago in the winter time?—Do you mean the money made or the weight of fish?

8826. The weight of fish?—Perhaps a dozen or 14 baskets.

8827. What do you get now?—Now we get sometimes 17 or 18 baskets.

8828. Then you think there has been a decided increase in the quantity of fish?—Yes, at times.

8829. But on the average, taking one time with another, do you think you can make a better living out of it now than you could 10 or 15 years ago?—Yes, I think I can.

8830. Tell us in money what the difference will be?—14 or 15 years ago I should average 8*l.* or 9*l.* a month, or perhaps 7*l.* or 8*l.*

8831. What can you average now?—We can average now from 8*l.* to 10*l.*, 10*l.* to 11*l.*, and 11*l.* to 12*l.* and on that way.

8832. Has that been in consequence of the increase on the price of the fish?—Perhaps there has been a little in that way, and a little in the extra quantity of fish caught.

8833. A little in both?—Yes.

8834. Are the quality and size of the fish as good as they were?—Yes, just about the same.

8835. Is there any particular kind of fish that has diminished more than another?—I cannot say, except perhaps a little of the flat-fish.

8836. You do not get as much flatfish as you caught formerly?—No.

8837–8. But with regard to all the other kinds of fish you think there has been an increase?—Yes.

8839. Have you been in the habit of trawling in-shore?—Not a great deal.

8840. Have you observed in your experience of trawlingin-shore that a large quantity of fish is caught there?—Yes.

8841. Small fish?—Yes.

8842. What is done with it?—It is thrown overboard.

8843. When you are out in the deep-sea trawling you do not find the same quantity of small fish?—No.

8844. Then you have no occasion to throw as much overboard in the deep sea?—No.

8845–6. Do you think it would be any hardship to the trawlers to exclude them during the warm weather from fishing in-shore?—No, not in the summer months.

8847. Would it be a hardship if they were excluded

BRIXHAM.

J Bowden.

10 Oct. 1863.

all the year round?—Yes, because there are times when we cannot go out to sea, and we are glad to get a shilling in-shore when we cannot go further off.

8848. Does that arise from bad weather?—Yes.

8849. In the winter months?—Yes.

8850. At that time you consider there is less injury done from in-shore fishing than in the summer months?—Yes.

8851. Do you get fewer small fish in the winter time?—Yes we get very little then.

8852. Not in the cold weather?—No.

8853. Have you been engaged in the herring-fishing here?—No.

8854. In no other fishing except trawl-fishing?—No.

8855. Have you ever fouled herring nets or mackerel nets?—No.

8856. Have you ever come in contact with the long-line fishermen's lines?—No.

The witness withdrew.

R. Pepperell.

ROBERT PEPPERELL called and examined.

8857-8. (*Mr. Caird.*) Have you been long engaged in the fishing in Start Bay?—Yes, more than 20 years.

8859. What kind of fishing have you followed there?—I am generally engaged in seine-fishing, in hauling the nets ashore; we haul them ashore in Start Bay.

8860. Can you tell us the size of the mesh of your nets?—The bunt of the mackerel seines is an inch from knot to knot.

8861. What other size have you?—For the arms of the net we have about $1\frac{1}{2}$ inches from knot to knot. Then we have other nets that we call "tuck" nets; we use them for catching flat-fish. They are put out at a distance of from 600 to 800 fathoms from the shore.

8862. What do you catch with them?—Flat-fish, such as plaice, dabs, and soles.

8863. What is the length of that net?—The nets are very short. We are obliged to go a long way off the shore The flat-fish do not come close in-shore. Our bay consists principally of large pebbles. We do not get any muddy ground till we get 200 or 300 fathoms from the shore. On account of the depth of the water, and the tides running so strong, we cannot shoot our seines for mackerel very close under the land. The average distance from the shore will be about 60 fathoms.

8864. How long in the course of the season do you follow the mackerel-fishing?—Generally we see the mackerel about the latter end of May, and not before that.

8865. Are they continuously on the coast from that time?—They are, up to the latter end of August, and sometimes in September.

8866. During the rest of the year what fishing do you pursue?—Some fish for crabs and lobsters, and others, during the summer time have the long rope nets and tuck nets for flat-fishing.

8867. Have you any long-line fishing or hand-line fishing?—Yes, we practise hook-fishing for whiting and bream.

8868. In your experience, has the quantity of fish fallen off or increased of late years?—The flat-fish has fallen off very much.

8870. Has any other kind?—No, I do not consider that any other kind has. The mackerel depends entirely on the season when it comes upon the coast, and so do the pilchards.

8871. You have them good one year and bad another?—Yes, sometimes we have an abundance, and at other seasons we have very little.

8872-3. Has there been any marked decrease going on gradually year by year?—Not a bit of it; there has been no decrease in anything except flat-fish.

8874. In flat-fish and soles has the size diminished as well as the quantity?—We catch a great deal of small fish in the summer season which I think we ought not to catch by using too small a mesh.

8875. What do you think is the cause of the falling off?—I think it arises from the trawlers working in the bays and using a small mesh.

8876. Then you think the evil arises from the use of a small mesh?—Yes from the use of a small mesh.

8877. Do you think if the trawlers used a large mesh in the summer time they would not do the same amount of damage?—I do not know how the trawl nets are constructed in comparison with our nets, but with regard to our own nets, I am satisfied that we catch large quantities of small fish, such as dabs, in the summer season, that we ought not to catch, and we catch them solely on account of the smallness of the nets.

8878. To what size should they be limited in order to avoid the destruction of these immature fish?—They should be what we call $3\frac{1}{2}$ inch; $1\frac{3}{4}$ inch from knot to knot.

8879. That is the legal size at present?—Yes, and it has been introduced in Start Bay already.

8880. Do you think it would be of advantage to everybody to use nets of that size?—I do.

8881. Would the fishermen like to see that law enforced?—Some of our common fishermen would fancy themselves injured, but I am quite sure that they would reap great benefit in the course of a couple of years.

8882. Have you ever observed spawn destroyed by the mode in which you fish?—No.

8883. Do you think any injury is done in your bay by destroying spawn?—No, we generally give up the tuck netting before the fish spawn. Flat-fish spawn about November, and we have finished then. We generally are not fishing till the month of March.

8884-6. With regard to fish, other than flat-fish and soles, is there as good a supply as there used to be?—Yes.

8887. Has the number of fishermen in your bay increased?—Yes, in some of the villages the number has increased, and in others it has decreased.

8888. Has the number increased on the whole?—On the whole it has increased, but in the crab fishery I think there has been a decrease.

8889. Are you yourself a crab-fisher?—No. Perhaps I may be allowed to say that in our seines we get no small fish except dabs. Our seines are 13 fathoms up to the bunt; it is necessary we should have them that depth on account of the deep water.

The witness withdrew.

G. Saunders.

GEOFFREY SAUNDERS called and examined.

8890-1. (*Mr. Caird.*) Have you been long a fisherman here?—Yes, for 50 years or upwards.

8892. Are you owner of a trawler?—Yes.

8893 5. Did you begin as a trawl owner?—No, I went as a servant after serving as an apprentice.

8896. But you have found it a good business, and have gradually become an owner?—Yes; the thing was that I had no other business to call my attention to.

8897. Have you found it a good investment?—I got my living out of it while I was obliged to work myself.

8898. Are you at this moment practising the fishing?—I do not go now, only occasionally.

8899. When did you cease to go to sea?—During the last three years I have been out a trifling time or so, but not as a fixed thing; I have been out very little indeed for three years.

8900. About three years ago you were fishing?—Yes.

8901. And you had constant experience of the fishing for many years previous to three years ago?—Yes, all my time.

8902. Have you during all that time been fishing continuously on the coasts in this bay?—Yes, and in the North Sea and the Silver Pits, and off here likewise at different seasons of the year.

8903. Have you observed in fishing in the North Sea and the Silver Pits whether the number of vessels has increased during that time?—They increase wonderfully.

8904. Have they increased on your own ground near home?—There has been an increase up to the present time since I was out of my time.

8905. Have you observed any falling off in the number of fish?—No, take it in and out it is apt to fall off some seasons, but we have not got the fish in our bay that we used to have.

8906. I am speaking now of the fishing ground in the deep sea, have you noticed any falling off there?—Not particularly; there has been no falling off equal to what there has been near the shore.

8907. Have you noticed a great falling off near the shore?—Yes.

8908. In what way?—We consider, as you have already heard, that the working of the bay in the summer time, when they catch the fish in its infancy, and where they drag every cove and creek and bay, that the fish has no time for rearing itself.

8909. Does it pay better to drag near the shore than to go out to sea?—They have no smacks to enable them to go out to sea; they only use those in-shore little coves.

8910. Do the trawlers who fish there fish the same as those who go out to sea?—Yes.

8911. Does it pay them better to fish in-shore?—They have a notion that they can get a night's work, when they do not care about going off.

8912–3. Is that in consequence of stormy weather?—No, frequently they have light weather, and they do not care about going off.

8914. Do you think it would very much increase the quantity of fish if the trawl fishermen were not allowed to fish in-shore during the warm months?—We have an opinion that it would.

8915. During what months of the year?—Six or eight months of the year.

8916-7. Do you think it would be of advantage that there should be some regulation as to the size of the mesh, or the net?—I think we have got them rather snug at present.

8918. Do you think they would be better a little larger?—I do not think it would do much harm if they were larger.

8919. Why do you consider them too small at present?—Because we take the small fish in the bay in our trawls.

8920. If your nets were made with a larger mesh would the small fish escape?—Some would, and some would not. Some of the small fish, if they got in the net and it had a large mesh, would get out, but if they were in for any length of time they would soon die, and would not be able to get out.

8921. Have you trawled much in-shore?—Yes, in turns.

8922. Have you ever found very small fish in your net?—Yes, at times.

8923. Was one-half of the fish you caught in the net small fish?—No, not so much as that.

8924. Was one fourth or one fifth?—Perhaps one third sometimes. If we have three baskets of fish we may pick up one of them very small at times.

8925. What do you do with them?—We chuck them overboard.

8926. Would they be dead?—Some would be dead and some would be alive.

8927. What do they consist of chiefly?—Little dabs or plaice, mostly dabs.

8928. Any soles?—Yes, we catch some very small soles sometimes.

8929. I understand you to say that the soles have decreased?—Yes.

8930. Do you think it necessary or advisable to make any regulation with regard to the length of the trawl beam?—No, not with regard to the beam, because that depends on the length of the vessel and the people who have the handling of it.

8931. Do you think it is at all necessary to regulate the size of the mesh?—Yes, I think it requires a little regulation.

8932. And you also think it desirable to exclude the trawlfishermen from fishing in-shore during certain seasons?—Yes.

8933-4. Do you think those two things would be beneficial generally to the fishermen here, and would lead to an increase in the supply of fish?—Yes.

8935. Have you had any experience of long line fishing?—No, I was never a long-liner.

8936. Have you ever been herring-fishing?—Not since I was 10 years old.

8937. Do you ever get foul of the herring nets?—No.

8938. Is there not much complaint on this coast of your boats fouling the herring nets?—I have known a little when the smacks have come in in wild weather in the nighttime.

8939. Do the French boats come on this coast to fish?—I have never seen them inside the edge of the land fishing. I have only seen them in the offing fishing in deep water.

8940. Do you meet with them there often?—Yes, in the winter season.

8941. (*Professor Huxley.*) You state that you have been fishing here for the last 50 years?—Yes, I have been fishing here for more than 50 years now.

8942. What would you consider a good take of fish for a week 50 years ago?—What would I consider a good take of fish for a week 50 years ago?

8943. Yes, a fair take for a week?—If we had fair weather for our fishing we might get from 8*l.* to 10*l.* worth's of fish during the week. Like everything else, it varies very much. One man may strike a few turbot more than another, so that you can hardly give an average for all the boats.

8944. I do not want to be very precise, I want a general average?—From 8*l.* to 10*l.* we should consider a good week's work.

8945. Was the price of fish higher or lower then?—It varied just as it does now, according to weather and the quantity of fish in the market.

8946. It was pretty much the same on the average?—Yes, I have known it dear when I was an apprentice and sometimes it is dear now-a-days.

8947-8. There has not been much falling off or rise in the price then?—No.

8949. What would you call a good average take of fish now?—If the boat takes from 8*l.* to 10*l.* worth now we call it a very good take.

8950. Then is the catch of fish pretty much the same now as it was then; has it remained pretty much the same from that time to this?—Yes, it is about the same in turns.

8951. But the kind of fish has rather varied; you say there have been less soles?—Yes, there are fewer soles in consequence of their being destroyed along the shore.

8952. Apart from the reason, is it the fact that there have been less soles?—Yes.

8953. Then that decrease must be made up by an increase in the take of other fish if you get the same money on the whole?—Of course, if there is less, if it is wanted, it will fetch the same in price.

8954. But you say the price is the same on the average, and that the quantity is the same, so that the falling off in one kind must have been made up by an increase in the other?—Yes.

8955. Do you recollect any of your forefathers, your father or your grandfather, talking of the time when trawling began here?—I have heard my father talk

BRIXHAM.

G. Saunders.

10 Oct. 1863.

about it. He served his time to it, and his father before him, but I do not recollect my grandfather very well.

8956. Have you heard your father talk of your grandfather being a trawler?—Yes.

8957. Is there any tradition among you as to when trawling first began here?—No, I think not. The trawls have been greatly enlarged, and the nets increased to a greater length and spread than they were even in my time.

8958. But you have no tradition or saying as to when the people about here first began to trawl?—No, but years ago they had not any smacks to enter the water of the size our men have got now.

8959-60. What was the size of the smacks when you first began trawling?—There were some small ones, but the smack I served my time in was 42 tons builder's measurement. She is in the harbour now.

8961. She must have been a good boat, then?—Yes.

8962. What measurement would that be according to the new measurement?—I think it would be over 30 tons if she was measured now. I daresay she has been measured under the new Act.

8963. That is not much smaller than some of the vessels now?—No, there are some here now that are not bigger than she is.

8964. Do you recollect how many trawlers went out of the harbour at the time you were a boy, and first went trawling?—About 60 or 70. When they came from the other ports, where they had been fishing, there would be more.

8965. When you were a boy was it the custom for some of the smacks to go away to the Bristol Channel and other places to fish?—Yes.

8966. Did some of them go north?—They did not go down to Hull; no further than Dover or Ramsgate.

8967. But they used to go to Dover and the Bristol Channel?—Yes.

8968. Fifty years ago?—Yes, I went myself to Dover fishing the first year my time was up. Now I am 64 years old, and then I was turned 21.

The witness withdrew.

T. Hodder.

THOMAS HODDER called and examined.

8969–71. (*Mr. Caird.*) Have you long been a fisherman here?—Yes, 66 years.

8972. What kind of fishing have you practised during that long period?—Everything, I believe.

8973. Was trawl-fishing carried on here when you began?—Yes.

8974–5. Was it very common then?—Yes. We had 60 sail of vessels engaged in it.

8976. Sixty years ago?—66 years ago there were 60 sail out of this port.

8977. Do you know how many there are now?—I should say there are 130 or 140 now.

8978. At that time were trawl-boats in the habit of going to distant parts of the coast, as well as fishing here?—They went from the Land's End to Portland.

8979. That was about the extent to which they went then?—Yes.

8980–1. When did they begin to go further afield?—About 10 years after that they began to go to Liverpool and Dover.

8982–3. Was there any cause for that; did they not find as many fish on this coast as they used to find formerly?—They went away on speculation.

8984. Did that system of going further away continue to increase?—Yes.

8985. Was it as a matter of speculation, or because they found the fishing becoming less productive?—There was no decrease in the fish; they went away entirely on speculation.

8986. Speaking of 60 years ago, did you then bring as much fish ashore as you do now?—Yes; five times as much fish.

8987. Five times as much then as you can catch now?—Yes. I could get more fish in a little boat, with a 14-feet beam, by myself, than they catch in one of their large vessels now.

8988. Were you engaged in a trawl-vessel 60 years ago?—I was.

8989. How many baskets of fish would you bring ashore then?—They were in the habit in those days of having baskets that would not hold sufficient fish for a family; they were so small. It would, therefore, give you no idea to tell you the number of baskets.

8990. Then tell us the weight?—I can tell you in a lump. We could get a boatfull in a few hours. By fishing six hours during the day we could get as much as a vessel's boat would carry.

8991. How long would it take you to get that now?—It would take a great deal longer to do it now.

8992. When did you notice the decrease begin?—It has been decreasing regularly.

8993. Has it always gone on since then; have the vessels been getting fewer and fewer every year?—Yes; and if it continues for the next 60 years, as it has been within my recollection, it will be of no use for any vessel to go fishing on this coast at all.

8994. You said the people did not leave this coast because the fish had decreased, but that they went away as a matter of speculation?—Yes.

8995. But now you tell me the fish are decreasing?—Yes, they are decreasing here.

8996. But you said before, and you have just repeated it, that the fishing boats did not go to distant parts on account of a decrease in the fish, but as a matter of speculation?—They went as a matter of speculation to try another part of the coast.

8997. How long is it since you have seen a boat-load of fish coming ashore from a vessel?—I see it frequently. Some of the vessels will be at sea three or four days, and then they will come in with a good cargo; but after six hours' fishing we could bring in sufficient fish to stock the market in my time.

8998. Did you make much more money by your fishing then than you do now?—We did at times.

8999. Did you get richer then than now?—Some people, who were owners of smacks then, are now living as gentleman on the property they have made. Nearly all the gentlemen in the parish first began to get their money by fishing.

9000. Have they made their money during the last 60 years?—Yes.

9001. Then they have found it a good business?—Yes.

9002. That is not exactly in accordance with what you stated just now?—I don't know that I have stated anything wrong in respect to that.

9003. You say that in former times they got a much larger quantity of fish than now?—Yes.

9004. But that the people engaged in the fishing business during that time have made a good business of it?—Yes.

9005. Then has the quantity of fish taken very much decreased as compared with former times?—Yes, wonderfully.

9005*a*. What kinds of fish?—There are three or four kinds of fish that are clean off the coast.

9006. What kinds are they?—There is first the haddock and then the pollack.

9007. Used there to be plenty of haddock?—Yes, plenty of haddock and plenty of pollack, and we had the megrim and marysole.

9008. Has the turbot fallen off?—According as the other kinds of fish have fallen off, they have fallen off.

9009. Have you noticed whether it is principally in the in-shore fishing or in the deep-sea fishing that the falling off has occurred?—No, but I think I know the way that it has fallen off.

9010. You are speaking of the decrease, are you not?—Yes; you have had it stated that the decrease is owing to the mesh of the trawl being so small, the consequence of that being that they catch so many small fish on the coast.

9011. Several witnesses have stated so?—Yes, I think so too.

9012. Is that in your opinion the cause, to a great extent, of the falling off?—It is the cause to some extent, but I call it only a little trifling thing.

9013. What is the larger thing?—I think the ground-rope is the evil.

9014. Tell us how that acts so injuriously?—Well you know that the spawn is laid on the bottom of the ground. This ground-rope weighing with the pair of irons to keep it down 250 lbs. is dragged over the ground; it goes over the ground at the rate of a tide, and for 20 miles it will scour the ground wherever it goes, and that, in my opinion, is where the destruction is caused. It destroys all the eggs.

9015. Have you ever seen the eggs brought up?—Yes, a number of times, in bunches. I have had to clean them out of the trawl.

9016. How long is it since you were in a trawl-boat?—I have not been in one for years now.

9017. When were you last in a trawl-vessel?—Twenty years ago.

9018. Then your experience of trawling has not been within the last 20 years?—No, but I am living in a place where there are trawlers, and a great many of my children are trawl fishermen, so that I know as much about it as they do.

9019. Do you live at Brixham?—Yes, I have been living here for the last 66 years.

9020. Do you follow the seine-fishing at all?—Very seldom.

9021. Have you ever done so?—Yes.

9022. Do you think the size of the mesh is too small?—They have been in the habit of catching different fish with the seine; sometimes pilchards, sometimes sprats, sometimes mackerel.

9023. Do you think that, on the average, they take too small fish?—It is very seldom that small fish will stop in the seine.

9024. Then do you think the seine nets do no damage to the fish?—I don't think the mackerel seine does.

9025. But do the other seines?—I think that as their meshes are so small they must take a large number of small fish.

9026. Have you seen these seines hauled on shore?—Yes.

9027. What did they do with the small fish?—I don't know.

9028. Did they throw it into the sea?—Most likely they did.

9029. Did you see them do so?—I have seen them lying on the beach.

9030. Where they hauled them ashore and left them?—Yes.

9031. Have you seen a great quantity lying on the beach?—Yes, fish of all kinds, such as whitings, dabs, plaice, and small soles.

9032. Have you seen that lately?—Yes.

9033. Do you think the seine net does a great deal of harm as well as the trawl net?—Yes.

9034. Do you think the injury done by the trawl net is chiefly in-shore or in the deep sea?—Mostly in-shore, I should say.

9035. (*Professor Huxley.*) You spoke just now of the eggs of the fish coming up in the trawl net, what were they like? I think you said they were in bunches?—Yes.

9036. What kind of looking things were they?—They were like a pin's point.

9037. They were in bunches?—Yes.

9038. Do you mean they were like bunches of grapes?—Yes.

9039. And that they were all hanging together?—Yes.

9040. Have you seen herring spawn?—I cannot say. I have no doubt I have, but I don't know whether my judgment is right or not.

9041. What time of the year was it that you used to see the eggs of the fish come up in bunches in the trawl?—Just before Christmas.

9042. How did you know they were the eggs of fish?—I did not know more than that I guessed at it myself.

9043. You spoke of the haddock having fallen off; used there to be plenty of haddock on this coast?—Yes, it has been so plentiful that it has been sold for about 6*d.* a bushel.

9044. How long ago is that?—About five or six years ago.

9045. Five or six years ago?—Yes, that is a fish that goes and comes. Some seasons there will be none, and at other seasons the fish will be very plentiful. How long they will be absent nobody knows.

9046. Five or six years ago, were there as many haddocks as when you began fishing?—No; there were more when I began fishing.

9047. There were more when you began than there were five or six years ago?—Yes.

9048. So that notwithstanding the abundance five or six years ago, there had been a falling off on the whole in the haddock?—Yes, and in all fish, in mackerel, herring, hake, and everything else.

9049. In mackerel and herrings as well?—Yes.

9050. Did you have many megrim on this coast formerly?—Yes.

9051. Is it got now?—No; in all my apprenticeship I never knew one to be got eastward of the Start, but I have seen an abundance caught at our very door in Torbay. Now they have clean gone off the coast.

9052. Were they as scarce in your apprenticeship as they are now?—Yes, the megrim were.

9053. How about the pollack?—We may catch one in 12 months now.

9054. Did you formerly get plenty?—I have been catching 40, 50, 60, and 70 in a day.

9055-6. Then, as I understand, you ascribe the diminution in the fish caught to the sweeping of the ground-rope over the bottom?—Yes, it disturbs the eggs.

9057. What remedy would you propose in order to remedy that evil?—I leave that to other people. I know nothing about that.

9058. Do you think it is beam trawling that is the great source of the mischief?—I think that it is the rope that does the mischief.

9059. You could not use the beam trawl without a rope, could you?—By no means. The trawl would be of no service without the ground-ropes.

9060. Then the only way to stop the evil would be to put down trawling?—No that would not do; if that were done all us poor fishermen would be obliged to give ourselves up to the Government.

9061. I want to understand clearly what it is you are saying; you told us that if things went on the next 60 years as they have been going on for the last 60 years there would be no fish to catch?—Yes.

9062. Then trawling will be put down if there is no fish to catch?—Yes, that is my belief if the fish go on scarcening as they have done since I remember.

9063. The scarcity has not been in one kind of fish but in all?—Yes.

9064. Then it does not matter whether the Government put down trawling or whether it is put a stop to in consequence of the fish going away; it would come to pretty much the same thing in the end?—It would not be of much conseqnence to me because I am getting pretty old now.

9065. How was your fish sent to market in your early days when you began fishing?—When I first went to sea as a boy the most of our best fish was sent to London. The greatest part we sent from here to Exeter, and it was then taken from Exeter to London.

9066. By what kind of conveyance was it sent?—By coach.

9067. Had you coaches running 60 years ago?—No, we hired carts then to take the fish into Exeter, and from Exeter it was sent to London in the coaches.

9068. Could you send any large quantity of fish to London in that way when the carts and coaches were used, so as to enable it to reach the London market fresh?—Yes.

9069. Could you send as much as you catch now in

BRIXHAM.

T. Hodder.

10 Oct. 1863.

the trawl. You catch 50 tons a week now, do you not?—I don't know what we catch, but they caught brill, soles, turbot, and doreys, all of which used to be sent to London from Brixham by land, although they could not get the fish in then in less than three days.

9070. Had you as many vessels then as you have now?—We had about 60 sail.

9071. Then 60 sail would catch a great deal more fish than now?—Yes.

9072. I want to understand how in those days, with only packhorses and carts and coaches, you contrived to get three times as much fish sent to London as you do now by the railway.—I can't say, but so it was.

9073. Do you think you did get as much as three times the amount of fish sent to market that you do now?—Yes, I think so.

9074. I think you said it took three days very often to take your fish to market?—Yes, it took us three days to get it into London.

9075. Was that in summer as well as in winter?—Yes.

9076. Then the fish would be rather queer sometimes when it got to London?—Yes, in the summer time.

9077, Did you ever lose a large proportion when it got to London in consequence of its not being fresh?—Not at all, because the merchants who bought it specuiated in it themselves. The catcher had nothing to do with it when it got to the London market.

9078. But the merchants would not pay you a good price for your fish if it was spoiled?—We never had any complaint.

9079. Did you get about the same price for it as now?—It was much dearer in London. They had a greater supply from this place than from any other part of the country.

9080. Did you as a fisherman get a better price for your fish per stone formerly than you do now.—Yes.

9081. Then you must have been getting rich all of you if you got so much more fish into the harbour and sold it at so much a higher price?—During the time the great dearth in reference to fish lasted I was an apprentice.

9082. When you were a man earning your own money, do you recollect what your earnings per week were?—I cannot tell; we got sometimes 20*s*., sometimes 30*s*., sometimes 40*s*., and even 50*s*. and 60*s*. per share.

9083. Per share?—Yes.

9084. What would be your average earnings?—Do you mean yearly?

9085. No, for the week. What would be the average of a week's earnings taking week and week about?—I cannot tell you that; I am not scholar big enough for that.

9086. Would the average run about 30*s*.?—Yes, somewhere thereabout throughout the year.

9087. We have it in evidence that about the same sum is earned now; some of the witnesses have stated that to us?—Yes, at the present time it is very likely to be true.

9088. Then if you got a deal more fish and a better price for it, how is it that your share was not much higher than it is now. I find it difficult to reconcile your statement as to the great abundance of the fish and your statement as to the money value got for your share. The value of your share seems to be about the same now as it was formerly, while on the other hand you state you had a much larger quantity of fish and got a higher price for it in your early days than now. I want to know why, under these circumstances, your earnings were not a great deal higher than the earnings of the fishermen now?—When there was a scarcity of fish it would fetch a great deal more in proportion than it does now. If fish was ever so scarce now the fishermen would never get what they got in those days, because if it is scarce in one place it is sure to be plentiful in another. Generally it is plentiful all over the country; it is supplied by the whole country now instead of by a few places.

The witness withdrew.

J. Bird.

JOHN BIRD called and examined.

9089. (*Mr. Caird.*) Have you long been engaged in the business of fishing here?—Yes.

9090. For how many years?—I suppose for about 30 years on and off, or better.

9091. What kind of fishing have you been engaged in?—In the pilchard-fishing, in the herring-fishing, and in the mackerel-fishing. I have practised all those kinds.

9092. What kind of nets do you use for catching those fish?—We use the pilchard net, the herring net, and the mackerel net, which is a seine.

9093. Have you found that you can catch those different kinds of fish in as great abundance as formerly, or is it otherwise?—The mackerel have failed us for the last three or four years, but there are plenty of pilchards on our coast.

9094. How is it with regard to the herrings?—The herrings have fallen off. There is not as good fishing as there used to be in former times. The net-fishing is not attended to now as it used to be, the consequence of which is that they don't catch as much fish.

9095. Are there not as many people employed in that kind of fishing as there used to be?—Yes, but it is not so well attended to.

9096. In what way is it not attended to?—In not going out in the same season to catch fish.

9097. Is the fishing not followed with the same skill as formerly?—No, far from it.

9098. Do they not do as they used to do formerly?—Not in the pilchard fishery. It has almost gone out.

9099. I think you stated that pilchards are abundant here?—Yes, there are plenty of pilchards, but our boats don't go outside to catch them.

9100. Is that because they find other modes of fishing a better business?—No, they don't take much fish otherwise.

9101. Then why do you think there is not as much attention paid to the pilchard fishing as formerly?—I think there is a great deal of negligence.

9102. Is it not because the people themselves find better employment?—I don't think so.

9103. If it paid them as well as anything else would they not take to it?—No, I think not. Pilchard fishing is clean given up altogether. We used to go down to Hope Cove and Plymouth for many years, and we went pilchard-fishing in Start Bay.

9104. What are those fishermen doing now?—They are engaged in hooking, and now and then use nets.

9105. Do they make as good a business as they used to do?—Far from it.

9106. Do they entertain the same opinion as you?—Most likely; I think they do.

9107. Why do they not go to the fishing as they used to do?—They can't now because they have not got the pilchard nets they formerly had.

9108. Are pilchard nets expensive?—They are on a smaller scale than herring nets.

9109. Do you think a great quantity of fish might be caught here if the fishing was followed?—Yes.

9110. During what time does the pilchard fishing continue?—In the months of September and October.

9111. Have you any experience or knowledge of trawl-fishing?—No, I never was a trawl fisherman.

9112. Have you any knowledge of the hook-and-line fishing?—I have been with the hook-and-line in the whiting-fishery.

9113. Did you hear it alleged, by some of the witnesses who have been examined with regard to the seine-net fishing in the bays, that a great quantity of the fish caught is left lying on the beach, or thrown into the sea as useless.—Yes.

9114. Is that true?—We have two seines in Brixham, tuck seines which shoot round the fish, and

BRIXHAM.

J. Bird.

10 Oct. 1863.

mackerel seines. Whatever small fish we catch we capsize into the sea again.

9115. Then there is no loss in that?—No, not in using the mackerel seine.

9116. Is there no loss by any other kind of seine?—Yes, by the drag seine.

9117. Is a large quantity of small fish destroyed by that?—They tell me it destroys a great quantity.

9118. Have you seen it?—No, but there is much talk about it in Paignton.

9119. You can't speak of your own knowledge about it?—No, I can only speak from hearsay.

9120. Have you ever observed any spawn in your nets?—I have seen herring spawn in the herring season. There is a great deal about the herring nets in the season.

9121. You were speaking about the herring-fishing having diminished?—Yes.

9122. Has that fishing very much fallen off on this coast?—It used to be a great deal more than it is now. I think we have not as many nets here as we used to have, nor is the fishing as much attended to. We don't try the nets as we did formerly.

9123. Are the herring fishermen going trawl-fishing now?—No.

9124. What do they do then?—They go hook-and-line fishing.

9125. Is it not a reason that the herring-fishing is not practised so much now that the men have found better and more profitable modes of fishing for themselves; have they not discovered that they can make more money some other way?—I don't think they can make more money.

9126–7. Are the shoals of herrings as large as they used to be?—Yes, in the season.

9128. Then quite as many fish could be caught as formerly?—Yes.

9129. You don't think there has been a diminution?—No.

The witness withdrew.

William Webber called and examined. *W. Webber.*

9130. (*Mr. Caird.*) Are you an inhabitant of Brixham?—Yes.

9131. Have you been living here for many years?—Yes.

9132-3. Have you observed the quantity of fish brought into the market here?—Yes; and several of my friends have been engaged in the fishing for the last 21 years.

9134. Can you speak as a fact to the increase or diminution of the quantity of fish brought ashore here by the fishing vessels off Brixham?—My impression is that there is decidedly an increase here. I impute that to the improved mode of catching the fish, and also to the increased size of the vessels.

9135. You think that the improved mode of catching the fish and the larger size of the vessels have resulted in increasing the supply of fish to the market here?—Yes.

9136. Has that been to a large extent?—Yes. I think that Mr. Benfield and Mr. Winkle send away now more fish than all the rest of the buyers in Brixham, and there may be eight or nine.

9137. Can you tell us particularly, or give us figures, as to the increased quantity of fish brought into the market here?—I don't know that I can give you figures, but I can give you one fact which perhaps may be as satisfactory to you as figures. Seven or eight years ago it was found necessary to enlarge the fish market here, and it was enlarged to double the size to accommodate the owners of the fishing smacks, because they had not sufficient room then to bring their fish into market. They were compelled to carry it beyond the boundaries of the market in order to accommodate the buyers.

9138. Has that double-sized fish market been constantly well filled since?—Yes, from my own general observation, I should say that it has.

9139. It was not at all overdone?—No, it was not overdone.

9140. Has the quality of the fish within your knowledge kept as good as it used to be?—Yes, I observe that the quality of the fish is quite as good as it ever was. I was looking at a large number of turbots last week. There were about 100 here one afternoon, and I don't think you would get two bad fish among the whole lot.

9141-3. Were they trawled fish?—Yes, all alive. Many of them were alive, as we should say, so far as the freshness of the fish goes, and some of them were actually living in the market.

9144. Have you noticed in the course of your experience whether many of the fish brought to market have been mangled or damaged by the trawl?—Not at all. The greatest difference that I see in any one kind of fish is in the whiting. What we call "hooked whiting" are much brighter than those caught in the trawl. When they are brought up in the trawl the scales are gone and they never look as well as those which are caught by the hook.

9145. Is that remark confined to the whiting?—Yes.

9146. You don't observe the same difference in other kinds of fish?—No. Connected with that fact I wish to mention that so far as catching fish by the hook and the long-line here is concerned, I can give you the result of hooking at the present time. I made inquiry yesterday, knowing that you were coming here, in order to ascertain what had been the result of the catches made last week by the hookers. I found that one man named Snell had got 9*l.*, another man named Hull had caught what brought 6*l.* 2*s.*, and another man named Perrott realized 5*l.* 3*s.*

9147. In what period of time was that?—In their week's work. I don't think these figures have been equalled since Brixham was Brixham. 9*l.* was made in one week by one man for fish caught by the hook.

9148. Was that on the ground where the trawl-fishers were engaged?—Yes, upon the ground over which they pass regularly every time they go out.

9149. You say that in your experience you have not known a larger amount gained by fishermen; is that due to an increase in the quantity of fish or to an increase in the price?—I should say it was solely due to the increase in the quantity. Yesterday was a very fair day, and judging from the state of the market there was a fair average quantity of fish brought in.

9150. Speaking in the interest of the line fishermen do you say that trawl-fishing does any injury to them?—In my opinion it does not do them the slightest injury in the world.

9151. How many men are there to each hook-boat?—Two.

9152. Then they must have made very good wages?—Yes, very good.

9153. Do they make a very good living in the hook-boats?—I think I heard one of them say that generally speaking he had made a better living than the trawlers; throughout the summer he stated he had earned a sovereign a week, and that is better than the trawlers have done. I may mention that during the last two years we have had extraordinary seasons for fishing. We have had many storms and calms intermediately, which have caused great stagnation, not on account of the want of fish, but owing to the want of the means of catching it.

9154. Rather want of opportunity?—Yes; the wind would generally be against the fishermen.

9155. If there has been a falling off, you attribute it to the weather?—To natural causes entirely.

9156. You think there is no falling off in the quantity of fish?—I am perfectly satisfied that there has not been any falling off. I can give you one fact. I can recollect a time when all the fish was sent away from here by packhorses; they were afterwards sent away

BRIXHAM.
W. Webber.
10 Oct. 1863.

by carts supplied by two men named Shears; they took the whole of the fish away, and the principal market was Exeter. They used to carry about a ton weight in each cart, and they had 3*s.* a cwt. for carrying it. Beyond that it was sent to Bath, Bristol, and London; but very rarely then to London.

9157. How many years is that ago?—About 30 years.

9158. You have given us the packhorses and then the carts; what was the next mode of conveyance?—Then the railways came, and Mr. Winkle came here; he took means for opening a sort of conveyance from here to the railway station. He had first-rate horses and waggons; each waggon would take from 3 to 3½ tons of fish. He took it to the railway station and charged so much per cwt. for its conveyance to its destination.

9159. Were there only two carts employed 30 years ago?—There were three. There was Lorum from Exeter, Davy from Chudleigh, and Tucker from Chudleigh; and then the Shears had three. Generally speaking, one cart a night would be what they had to carry, and they had three or four horses.

9160. How many carts would there be altogether?—I have seen them start here at night in a line. The man Davy used to be called the Commodore, and there would be about 11 carts altogether.

9161. What are the quantities sent now?—I have seen Mr. Winkle come three times in a day, besides the carts from other places. There is a great deal of this, because Torquay absorbs a large quantity of our fish. They have no boats of their own, and therefore we send a great abundance of fish there.

9162. How much weight would each of these carts hold or carry?—About a ton.

9163. Then that would be about 11 tons in one night?—Yes; at times.

9164. Taking similar times now, how many tons go to the railway station on a fair average day?—I should say from 15 to 20 tons.

9165. Besides the quantity that is sent to places in the immediate neighbourhood?—Yes; in addition to what goes eastward; to Beer, Salterton, Budleigh, Exmouth, and other places.

9166. Then, besides the quantity that goes to the railway station there is a large consumption at Torquay and other places?—Yes, decidedly so.

6167. From these facts you consider there has been a great increase in the quantity brought to this market?—Yes, I do.

6168. What is the size of the vessels here?—The vessels here are from 50 to 60 and from 60 to 70 tons. They are nearly one-half larger than they were formerly, and they only carry four men, three men and a boy. They used to carry the same number of men; but they have also improved the machinery on board these vessels, which gives them greater power in working their gear. I have been out with these vessels several times and seen them worked.

9169. By means of mechanical labour they do a greater amount of work?—Yes.

9170. You have heard the evidence given this morning?—Yes.

9171. You have heard the general opinion expressed, that by the in-shore system of trawling the flat-fish and the soles had been decreased?—Yes, but that is not my opinion. I have heard those statements generally made, and I think a sort of stereotyped evidence has been given by a number of the men who were made conversant with each other's views last night; my own opinion is that that statement is not correct.

9172. You have not observed it yourself?—No, not in any way.

9173. They used to have different methods for packing up their fish?—They had pots or hampers of soles, each weighing 30 lbs. If a boat got six of these hampers it was considered a good catch. I have seen them make a guinea a hamper for 30 lbs. weight.

9174. Then you don't agree with the opinions expressed by other witnesses, that the quantity of flat-fish and soles has been diminished in consequence of trawling in-shore?—I don't; most decidedly not.

9175. Then you don't apprehend that any great injury is done to the fish by that system of in-shore trawling?—I agree with the men that on no account should boats be allowed to come into the bays at certain times of the year, or rather at no time of the year should they be allowed to come into the bays at all.

9176. For what reason?—For this reason, that I believe if the fish are allowed to be quiet there, as soon as they come to maturity they will go into the deep water. The spawn of the fish would, in that case, be continuous, and there would be a sort of nursery for the express purpose of supplying fish. When the late Lord Vernon was living at Churston Court, I have seen them bring ashore little haddocks and plaice, like ivy leaves, not larger than a five shilling piece. Lord Vernon argued with them, and pointed out that they were destroying their own commonwealth, and induced them to refrain from that mode of fishing. He left some of the men pensions, and took great interest in their welfare. He persuaded them to keep away from the bay; they did so for two years, the consequence of which, was, that the catch was nearly doubled.

9177. Would that increased catch be solely in consequence of the men not coming into the bays to fish?—The quantity of fish they thus caught was much larger than what they previously caught on the common ground.

9178. Would you prevent trawl-boats from coming inside the headlands altogether?—Yes.

9179. At any season?—Yes, at any season.

9180. Would that not in bad weather limit the labour of the fishermen?—No. I would rigidly enforce that rule, because I believe it will be beneficial to the whole of the fishermen ultimately.

9181. You would exclude them altogether?—Yes, from fishing within the headlands.

9182. Is there any limit outside the headlands to which you would confine them?—Yes, I consider that the common ground beyond the headlands should be limited. I agree with what the witness Salter stated, that a mile and a half or two miles would be a fair limit.

9183. How far is the common ground off the heads?—About three miles.

9184. Outside the heads?—Yes.

9185. Is there any other mode of fishing inside the heads that you think is injurious to the catch of fish?—I don't know of any. You have been speaking of the drift-nets. Now there is a certain description of net that they call here nets that are moored. They have an anchor; they are laid at the bottom; they are buoyed up at the top, and they stand perpendicular in the water. Now I think it is very important that they should be limited to a certain size of mesh for haddocks and mackerel only. That would give other smaller fish an opportunity of escaping, and the fishermen would then only take those fish that ought to be caught.

9186. Do you think they take many immature fish?—Yes, I think they do. That is one of the restrictions that ought to be imposed upon them; namely, that a certain size of net should be employed. Professor Huxley asked just now about the Convention between France and England. The fisherman to whom the questions were put said he was not aware of the regulations in regard to the length of the beam, the size of the mesh, the colour of the vanes, and the weight of the heads. Now, in my experience as clerk to the magistrates of this town, there have been several parties convicted for breaches of the law in those respects, so that I can hardly fancy that the fishermen can be as forgetful as they pretend to be. More than that, about three years ago an order came down from the Board of Trade to seize every trawl in the port. A kind intimation was given here in regard to what the intention of the Board of Trade was, and a memorial was got up. I think Mr. Henley was President of the Board of Trade at the time; it would be about 1859. A man named Cornish was brought

into Dartmouth and fined for having a small net. It turned out that the men had no proper supervision with regard to the size of their nets at all. They had no one to supervise them, and they went on pretty much in their own way. The consequence was that they had got a mesh which, as one of the witnesses said this morning, was very snug. That was complained of by the hook-and-line fishermen, and a message was sent down here to seize all the nets.

9187. In what way was that message announced to you?—I believe we heard it first from the collector at Dartmouth.

9188. Did he advertise it?—No; I think he sent to say that the nets would be seized and burned unless the nets were made of a larger size.

9189. Was that publicly announced?—No, I think it was simply stated that he had received an intimation, and that it was intended to send a person down to examine the nets. It was then explained how it was that the nets had got less and less, and that if it was really intended to burn all those that were not legal, the whole lot would have to be burned together, and that the vessels would have to be detained until they got other gear, which would be a loss to the fishermen of thousands upon thousands of pounds.

9190. Was the object of the message to let the fisherman know that their nets would be burned in consequence of their being too small?—Yes.

9191. Was that sufficient to frighten them?—It was sufficient to induce the president of the fishing club to call on me in order that we might get up a memorial.

9192. Were they conscious that the nets they used were too small?—Yes, one fisherman had been fined a week before at Dartmouth, in the Guildhall, and that had alarmed all the rest of them.

9193. Did anything follow upon the steps you were told would be taken then?—No.

9194. Did nobody come to look at the mesh?—No.

9195. Then nothing followed that announcement?—No.

9196. Was that in consequence of your memorial?—I think all the circumstances were represented to the Board of Trade, and a general notice was given that the present nets should be discontinued when they were worn out, and that in any new ones to be made the mesh should be larger. An understanding of that sort was come to and the law was not enforced.

9197. Has no Revenue cutter interfered with the fishermen?—I heard one of the fishermen who came here the other day say that he was off Paignton Head and had got his trawl down when a Revenue cutter came and ordered him off immediately, or else he would have been reported and prosecuted.

9198. What did the man do?—I believe he pulled up and went away.

9199. The Revenue cutter ordered him off?—Yes, off the Head.

9200. Was that on the ground that he had no right to fish there?—Yes.

9201. Then was it against the law?—I suppose so.

9202. Did he go?—Yes.

9203. Have any other fishermen been served in the same way?—That fact was mentioned in conversation when it was known that you were about to visit this place.

9204. Do you know anything about the system of horse trawling referred to by previous witnesses?—Yes, I have had reason to know that; I communicated the fact to the editor of the "Shipping and Mercantile Gazette." I went on purpose to see it.

9205. Where did you go to?—To Paignton.

9206. How long ago?—About three months ago. I went all along the shore to see these infernal machines, as I call them, on account of the destruction they do when at work; they were very much talked about, and I went to see the trawl at work. There was a horse in a pair of shafts drawing it, up to his belly in water; a man rode the horse, and they dragged the net alongshore; the water was rather shallow, and it was dragged along the shore one way and then turned and dragged along the shore the other.

9207. Is it like a large shrimp net?—Yes, a triangular sort of net. It was lashed to a yard, and it had two loops to bring it up to the cart.

9208. Did you see the size of the mesh?—Yes, it was very small indeed, it looked like a lady's purse.

9209. What did it bring on shore?—Shrimps, brill, soles, and all kinds of small fry you can fancy.

9210. Did you see them?—Yes, I saw them and handled them.

9211. What was done with them?—The fishermen took them out and threw them away; perhaps some of them might be brought here to Brixham market. Many men here can tell you that these men, when they have brought their shrimps here, have selected the largest of the small fish and have thrown them out upon the market.

9212. Is a large quantity of fish destroyed in that way?—It is the most destructive kind of fishing that can be, save and except the bunt seines.

9213. Between these two you think a great destruction of fish takes place?—The whole of the destruction is attributable to them.

9214. Do you believe in the disturbance of the spawn by the trawl net?—No, it is not disturbed the slightest bit in the world. I think, as a general rule, that fish, like land animals, resort to quiet places in order to spawn.

9215. Are there large quantities of these horse trawls used on this coast?—I have seen as many as three or four.

9216. Do they follow each other?—Yes.

9217. Do you think that the three or four did much damage?—Yes, and I think you would say so too if I brought you what they catch; scores and hundreds of pounds worth in a month.

9218. Did you ever see it used for manure?—I have seen sprats used for manure, but that was because there was a very large quantity caught. The quantity was so large that there was no sale for it, and it was therefore sold for agricultural purposes.

9219. Is there a large quantity of sprats caught in Torbay?—Yes.

9220. Can it be commonly depended upon?—The Torquay men will speak better to that. They have the nets which are adapted for that kind of fishing.

9221. (*Professor Huxley.*) Do I understand you to say that the only attempt which has been made to enforce the law has been by the Board of Trade?—Yes, so far as my recollection serves me. I am speaking now of a personal experience extending over more than 15 years.

9222. You are engaged in the administration of the law here?—Yes.

9223. You are familiar with this Act of Parliament?—Yes.

9224. Then you will be aware that it is perfectly competent for any person to bring up a fisherman for contravening the law?—Perfectly so.

2225. If I were to go and lay an information against your trawlers in the harbour, I could have every one of them convicted?—Yes; but I rather think there is no public prosecutor appointed.

9226. The Act says: "And be it enacted that all "offences against the said article, or against any rule "or byelaw made in pursuance of this Act committed "by any one of Her Majesty's subjects, may be heard "and determined upon the oath of any credible "witness or witnesses, or upon the confession of the "party accused, by any magistrate or justice of the "peace having jurisdiction in the county in which, or "in the waters adjacent to which, the offence shall be "committed, or to which the offender shall be brought, "and any such magistrate or justice of the peace shall "have power to award the penalties provided by the "said article, or by any such rule or byelaw, for the "offence of which the offender shall be convicted, and "whenever any pecuniary penalty and forfeiture shall "be imposed on any such offender and shall not be "forthwith paid, with the reasonable costs and charges

BRIXHAM.

W. Webber.

10 Oct. 1863.

"attending the conviction, the same shall be levied by "distress and sale of the goods of the offender by "warrant under the seal and hand of such magistrate "and justice of the peace." Does not that put me in the category of a credible witness, and make it perfectly competent for me, or any stranger, if I find the meshes too small or the beam too large, to summon the offender and have him punished?—You may be a credible witness, no doubt, but I doubt whether you could be a common informer. Under that Act, I admit that you could be a credible witness.

9227. The Act says: "All offences against the said "article may be heard and determined upon the oath "of any credible witness."—Exactly; but the great point is, who is to be the party to give the information. You could be called as witness, but who is to give the information.

9228. Do you consider that, under this Act, the only persons who can give information are officers in Her Majesty's service?—That is my opinion. I think that, in any future legislation, you should provide for preventing that evil by appointing a public prosecutor. There should be one person appointed who should look after everything of the kind, and rigidly enforce the law on the subject.

9229. There is no statement in the Act that no information shall be laid except by an officer of the Customs or Navy?—But when one party is appointed all the rest is considered to be negatived. If I understand it, the Act says that a Custom House officer is to be the party to give the information, and then it is assumed that any other person is exempted.

9230. Suppose I were to lay an information, would you advise the magistrates that that information should not be received because I am not named in the Act?—If you chose to lay an information, I should allow you to lay it in the first place, and then by and bye, when the question came to be discussed, not extra-judicially, but on the bench, I should give the magistrates my opinion on the matter.

9231. And your opinion is that I would not be the proper party?—Yes; but you would be competent to give evidence. On your testimony the offender might be convicted, but you are not the person to lay the information.

9232. Then you think that the information is to be laid by the party aggrieved, or by an officer employed in Her Majesty's Navy or in the Revenue service, or in the Coastguard service?—Quite so, that is my impression.

9233. Then I don't clearly apprehend how the Board of Trade came to act, because it is not one of Her Majesty's officers employed in either of these capacities?—But they have full power to put the Custom House officers in motion.

9234. Was that the way in which the thing was done?—Yes.

9235. Am I to understand from your experience of the way in which the Act is worked among the fishermen, that it is cumbrous in its operation?—Yes, I think so.

9236. That it cannot be put into operation?—No.

9237. Are there any Custom House officers here?—Yes, the commander of the Coastguard is now in the room.

9238. Of course it would depend upon the orders given to the Custom House officers and the Coastguard whether they could carry out the provisions of the Act or not?—Precisely; the Custom House officers at Brixham, or the Coastguard, would wait instructions from their superior officers or from the Board of Admiralty.

9239. Then there is no regular inspection exercised by the Coastguard or Custom House officers?—No.

9240. Do you think it would be a heavy addition to their other duties?—No, I think they would be willing to undertake if they were required, but how far it would be necessary to increase their salaries would be quite another thing.

9241. In walking round the town this morning we observed that a considerable new pier has been built?—Yes.

9242. How was the expense of that defrayed?—The construction of the pier was sanctioned by an Act of Parliament passed in the first year of Her present Majesty, and a schedule of tolls was annexed to the Act by which the expense was provided for.

9243. But who supplied the capital in the first instance?—The inhabitants themselves; some of them put in 500*l.*, others 200*l.*, and so on.

9244. Were they all Brixham men?—Yes.

9245. Then, the money came out of Brixham?—Yes, and is still coming out of Brixham as the work progresses.

9246. Where does the money of Brixham come from?—As far as my recollection goes, I think the Tyrers, the Weightons, the Terrys, and the Blakes, and all those men were originally fishermen. I believe they all had vessels. Mr. Bartlett's grandfather had three or four trawlers.

9247. Were they all trawl fishermen?—Yes; I believe they have made all that has placed them in their present prosperous circumstances from trawling. They have now some of the finest vessels sailing in the Bristol Channel.

9248. Is there any branch of trade or manufactures carried on here?—No; the only staple business in addition to fishing is mining; there is a little iron ore here.

9249. Is there a considerable quantity of iron ore obtained here?—We have two mines now working, and I think I heard them say yesterday that they would be able to raise 2,000 tons a month if they had the appliances.

9250. Have they been able to work that for any time?—They have had mines here for 20 years. At one time they shipped enough to increase the tolls of the pier from 600*l.* to 950*l.* in a single year.

9251. Do you consider that the iron mines here have added considerably or appreciably to the wealth of the place during the last half-century?—No; it was not known then. I think it has added to the prosperity of the town in a certain sense, by bringing a number of men who are earning good wages at mining.

9252. Still you would not consider it any way comparable, as a source of wealth to the town, to the fishing?—No, because we almost wholly depend upon that.

9253. I ask these questions because we have come recently from the north country, and strong assertions have been made to us that you Brixham people have been gradually ruining yourselves for years past, and are now in a very bad way. I want to know whether that is the case, or whether you have been making money all the time?—I will just show you how it is. A man may perhaps have 150*l.* or 200*l.*, and he has a new vessel built. He can find people who are ready to put the remainder of the money into that, and thus assist him. Tradesmen are ready to put their goods on board, if he is an industrious man, and they will give him credit for everything he requires. Now, that shows that the investment is a paying one, or it would not be so readily taken up.

9253. I suppose the security the fishermen give is a mortgage on the vessel?—Yes.

9254. I don't want to look inquisitorially into the matter, but only to ascertain the facts which are of importance to our inquiry. If I went to the Custom House here, should I find that a great number of the smacks are mortgaged?—Yes, for this reason, directly they get an additional 100*l.* saved they go and get another smack.

9255. But there is a great difference in the two things. If a man is ruining himself he mortgages that which was previously in his possession, but it is a legitimate sign of prosperity if a man sets up a vessel and obtains a mortgage upon it with the intention of paying it off. Are the mortgages here of the latter or former kind; are they mortgages made with the intention and almost certainty of paying them off

in after years ?—Yes, quite so; they are almost entirely upon new vessels.

9256. From your knowledge as clerk to the magistrates, who generally knows a good deal about people's affairs, you think that is the state of things ?—Yes, I do.

9257. I ask this particularly because assertions have been broadly made to us that the contrary is the case, and that the persons engaged in trawling here are mortgaging their property in order to raise money. You think it is the other way ?—Yes, in point of fact the tradesmen of Brixham know less of bankruptcies among themselves than almost any other town in the neighbourhood. The people here are pretty certain of getting their money whether they are hemp merchants, timber merchants, or hook manufacturers.

9258. What fish are caught by the hook ?—Whiting, ling, and cod.

9259. Do you agree with the statement of the previous witnesses as to the quantity of fish taken by the smacks on the average; do you think that on the average all the smacks engaged are bringing in 50 tons of fish a day ?—I think that statement was only a guess. I have tried to obtain information accurately, but have not succeeded. There was an old gentleman here about 16 years ago, who was examined before the House of Lords on this subject. He took the trouble to ascertain the weight of all the fish brought in here. I went some time ago and tried to obtain the book in which these calculations were contained, but I found that one of his sons, who is a Custom House officer at Bridgewater, has it with him.

9260. Probably you can get it for us by and bye ?—It is now in Bridgewater, in Somersetshire. But making a little allowance on the one side and on the other, I think the evidence of the witnesses generally is good evidence, and I think it will be amply justified by the facts.

9261. I don't conceive in what way it is possible that 50 tons of fish could be sent off by the old fashioned mode of land carriage ?—That puzzled me all through. The last witness talked of great quantities being caught 30, 40, and 50 years years ago, and yet the facilities afforded then for taking the fish inland were simply packhorses. We have now got the railways and many other facilities, and yet we don't send away any larger quantities. That is a kind of paradox that I scarcely understand.

9262. We were talking of the destruction of small fish just now. Your argument is that it is destroyed by the fishermen, but doubtless you are aware that it is also destroyed in prodigious numbers by other fish which prey upon it. Thus, in putting down the destruction of small fish by the in-shore processes, it does not appear certain to my mind that all the fish destroyed by the in-shore fishermen would ever grow up to be full sized fish ?—Your argument is no doubt very good. Last year it was most extraordinary that about the month of June every fishing smack took about a dozen and a half up to two or three dozen of hakes, for which they got from 6*s*. to 7*s*. and 8*s*. a dozen. Frequently after that the boats took 50 dozen a day, and only made about 1*s*. a dozen. I have no doubt that when that great increase of hakes took place in our bay a large portion of the fish here was destroyed by them. And so with regard to oysters. I recollect one year, about 10 or 12 years ago, that a number of smacks came down here from the eastward, oyster fishing. The whole of Torbay appeared at that time to be paved with oysters. I never saw such a quantity before and have not seen such a quantity since. This quantity of fish came in and remained four or five weeks, and after continuing that time they disappeared altogether, and the supply came to its old standard. Now, I take it that when they came here they must have had food. It would be about the same as an army coming into a town. No doubt they committed great destruction on the small fish.

9263. I express no opinion as to whether this destruction of small fish is good, bad, or indifferent, I only wish to know whether as a fact it takes place ?—I should think it does as a natural rule, but the same rule has always prevailed with regard to the destruction of small fish by large ones. It was the same 50 years ago as at present. The destruction in Torbay is not greater now than it was then by that means; I attribute the increased destruction of small fish solely to the causes I have mentioned to you.

9264. Then you have no doubt as to the decrease in certain kinds of fish ?—I am inclined to believe from my own observation that there has not been the slightest diminution in the quantity of fish caught here.

9265. Not in any kind of fish ?—No.

9266. Then where is the evidence of the harm having been done by fishing in-shore ?—I am speaking of the fish caught on the trawl-ground and not of the sources from which the fish generally come. For instance, with regard to the hake we find that it is generally caught first down at the Land's End; it is caught there and at Plymouth before it is caught here.

9267. But the two things don't hang together. The injury done by the small net fishing is considered by the other witnesses to be the occasion of the assumed decrease in the fish. You don't believe in that fact, and I want to know for what reason ?—I take it be a logical deduction that there is no more destruction now than there ever was. There has been a disturbance of the fish here for years and years. All the fishermen have been in-shore fishermen before they became deep-sea fishermen, and if that has been the cause of the destruction of the small fish then that has been a constant cause of that destruction since the fishing began.

9268. But if there has been no diminution in the quantity and size of the fish, what harm has been done ?—There may have been no harm apparently; that is the actual quantity of fish may not have diminished, but they might have had three times the quantity they got if the small fry had not been destroyed.

9269. That is simply a supposition ?—It is an inference, of course.

9270. As the facts stand there has been no decrease in the supply of large fish ?—I don't say that there has.

9271. Then as matters stand there is no proof beyond the supposition that there might have been an increase ?—There is no proof beyond this, that the fishermen did not commit the same damage in former times that they do now. I believe that there was always great destruction on the part of the Paignton and Torquay men.

9272. You think if they had not fished in the way you have mentioned there would have been more large fish ?—Yes; the trawlers would have been enabled to keep altogether out of the bays.

9273. But you draw a distinction between having that opinion and having proof of it ?—Yes.

9274. I think you spoke of some kind of nets that were anchored, what sort of nets are they ?—They are anchored with what they call a buoy at each end. The buoy is generally a keg. The head line is kept floating by corks, and they remain perpendicular in the water; they are quite steady, almost, in the water; the fish get entangled in them.

9275. What fish are caught in that way ?—Herring, mackerel, pilchard, and sometimes hake. They sometimes use what they call hake nets.

9276. Are the hake caught in that way ?—Yes.

9277. Where are these nets set ?—Along the shore and across the bay, from Berry Head to Torquay.

9278. They are not set outside the bay ?—No; if the mesh is too small the fish would be entangled when they ought not to be caught at all.

9279. Is there no record kept here in the port of the quantity of fish brought in day by day ?—No, none.

9280. Would it not be a simple thing to do that if there were a proper officer appointed ?—Yes.

9281. Would not that be the best way of settling these disputes as to the decrease and injury done to the fish ?—Yes.

9282. Is there no means of getting at that here ?—

BRIXHAM.

W. Webber.

10 Oct. 1863.

No, I don't think there is. The railway could not give a correct return, because they only get about half the quantity caught.

9283. Then there is absolutely no record kept in the port?—No; we take it as matter of opinion, every bit of it is guess work.

The witness withdrew.

C. Bartlett.

CHRISTOPHER BARTLETT called and examined.

9284. (*Mr. Caird.*) Do you fish for shell-fish—lobsters, crabs, and oysters?—Yes, for all kinds of fish.

9285. Have you found that the lobster-fishery is increasing or diminishing here in the yield?—It has been diminishing a great deal, especially in crabs.

9286. What is the cause of that?—I can give no account of it unless it is that the trawlers bring a great many ashore; but whether that makes any difference I don't know. I don't think it does make much difference for they catch them a great way off.

9287. Are there many boats employed in that fishery?—Yes.

9288. Are there more crabs brought ashore than there used to be?—No, not half so many.

9289. Not by the increased number of boats?—Not a quarter as many.

9290. What is the reason the crab-fishing has fallen off?—I can't give any account of it.

9291. Have you no idea in your own mind?—No, unless the trawlers take them up and don't allow them to come to land.

9292. Have you ever been a trawl-fisherman yourself?—Yes.

9293. Have you ever seen many crabs caught in the trawl?—Yes.

9294. What has been done with them?—They have been brought ashore and sold.

9295. Then they come to the market equally the same?—Yes.

9296. Then there is no smaller quantity brought ashore?—No, I think the quantity is larger.

9297. Does that apply to lobsters as well as crabs?—No.

9298. The trawl-boats don't catch lobsters as well as crabs?—No.

9299. Do you think the quantity of lobsters caught is increasing or diminishing?—I think it is diminishing a great deal.

9300. If they are not caught in the trawl, what is the cause of the diminution in the case of lobsters?—I can give you no account whatever more than that I know we don't catch as many. Perhaps they hide in their holes and won't come out.

9301. Do you get any oysters here?—A few sometimes.

9302. Are there no oyster beds on this coast?—Not a proper one. There is not a proper oyster bed inside of Torbay.

9303. Is the oyster-fishing followed here?—Not a great deal, it is only followed by a few small boats.

9304. Do you find that you get as many oysters as you used to get?—No, not quite as many.

9305. But there is no large oyster fishery here?—No, there is not a proper bed; there has not been since I went apprentice.

9306. (*Professor Huxley.*) You are a long-line fisher?—I fish all sorts. I can turn my hand to the whole of it.

9307. Trawling as well?—Yes.

9308. When you were a long-line fisherman did you find that the trawlers did you any mischief?—I don't know that they ever did me any harm.

9309. Did they do any harm to the long-line fishers generally?—It is not the long-line that we use.

9310. Do you use the hand-line?—No, not the hand-line. We have lines that are not one fourth the length of those they use in the north country.

9311. What is the length of your line?—We have about 300 hooks on a line, which are from 1½ fathom to 2 fathoms apart.

9312. What is the length of the snoods?—I should say about 6 feet. In the small boats we don't require these hooks.

9313. The snoods then will be about one fathom in length?—Yes.

9314. And the hooks are about a fathom apart?—No, from 1½ to 2 fathoms.

9315. Why do you not have longer lines?—We don't think it would pay.

9315*a*. Have you not sufficient room in your bay?—The fish don't come into the bay.

9316. Where do you place your long lines?—About the rocks, and about the Mudstone.

9317. On the rougher ground?—Yes.

9318. Then the trawlers can't work over you?—No.

9319. And for that reason they don't interfere with you?—No.

9320. Is that what you call a "bulter"?—Yes, that is what we call a "bulter."

9321. Is the mode which you have described the mode in which all the long-line fishermen fish here?—No, only a certain number of them.

9322. But it is the only kind of long-line fishing you have here?—Yes, about this part of the country.

9323. Then you have no reason for disliking the trawlers here?—There is no reason on the part of the long-line fishermen for disliking them.

2324. We find that the long-line fishermen, mostly, don't like the trawlers at all?—I don't see any harm in them. I think it is rare for them to catch the conger in the trawl, and that is what we mostly go after.

9325. Don't you catch cod-fish as well?—We like to see them come to the hook in the season.

9326. They are not abundant here?—No, we sometimes catch five or six.

9327. Do you catch any haddock?—I don't know that I ever caught one in my life bultering.

9328. How do you catch them?—By using the hand-line we may catch one or two in the season.

9329. Are the haddocks scarce here?—Yes, very scarce.

9330. How long have you been engaged in fishing here?—For the last 29 years.

9331. Have they been scarce all that time?—There have only been two seasons in which they were plentiful.

9332. Then there has been no regular diminution; except for the two seasons they have always been scarce here?—Yes, they were scarce before those two or three years, and they have been scarce since.

9333. Do you fish for herring with the drift-net?—Yes.

9334. Do you find that the trawlers interfere with you there?—Not often.

9335. Do they not get foul of you?—They never have done so yet.

9336. What is the length of your herring train?—We have about 200 fathoms.

9337. How many nets will that be?—Four.

9338. You have very short trains here then?—Yes; some have 15 nets, some five, some six, seven, and eight. They put out 500 and 600 fathoms, some of them.

9339. What mesh do you use here?—It is the proper herring scale.

9340. What is it?—Some of them are not larger than a shilling, some will be a shilling; that will be 36 to the yard.

9341. Does anybody look after your nets here to see that they are of the proper size?—I never saw anybody, but they are generally the proper size for herring nets. We have a different net for the pilchard net.

9342. Do you use a different net for the pilchard?—We ought to use a different net. The boats that went out pilchard fishing with the herring net have not got any at all. The fish go through the net.

9343. Through the inch mesh?—Yes.

BRIXHAM.

C. Bartlett.

10 Oct. 1863.

9344. Do you catch pilchard with the seine here?—Yes.

9345. Have you had a chance of catching them that way lately?—I did two seasons ago.

9346. Do they vary very much?—Yes.

9347. Do as many pilchards come here as did 20 years ago on the average?—Yes; if the herring netters had a proper pilchard mesh they would catch them as plentifully as they did 20 years ago.

9348. What do you call pilchard nets?—The proper pilchard scale is rather under the shilling scale.

9349. Then what has made the fishermen use nets of a larger size?—The nets they use are for herring, but the herring takes one size and the pilchard another.

9350. They use their herring nets for pilchards?—Yes, but they can't catch pilchards with them.

9351. You think they ought to have distinct nets?—Yes.

9352. How many meshes to the yard will there be in a proper pilchard net?—About 38, I think.

9353. Would that small difference in the size make all the difference in the catch?—Yes, it would make all the difference; because if the fish gets in above his gills he will go right through. This is especially the case in regard to the pilchard, which is a round fish.

The witness withdrew.

(*Mr. Caird.*) Is there any other fisherman who desires to give further evidence? We have now gone through the list of witnesses, but we should be glad to hear any additional evidence that may be tendered.

W. Calley.

William Calley called and examined.

9354. (*Mr. Caird.*) Have you any means by which you are able to tell us accurately the number of vessels employed in the fishing here?—Yes; I am president of the fishing club.

9355. Do you keep any record?—Yes.

9356. Will you tell us the number?—The number of vessels employed in Brixham at this time is 90. In addition to which there are five extra, making 95 that fish here the greatest part of the year. I find, by referring to the list, that there are about nine or ten that go to Tenby from May to September, and about a dozen that go to Hull and Ramsgate to fish from November to May; that makes an average of from 80 to 85 here throughout the year. The nine or ten which go to Tenby leave in May and return in September, and the 12 which go to Hull and Ramsgate go in November and return in May; so that the number generally fishing off here will be about 85.

9357. That is not the whole number of boats engaged here?—Yes, the whole number engaged here. We have 152 vessels insured in the society, but the condition is that they must belong to a Brixham man. Independent of the vessels which are at Brixham, there are 41 the owners of which reside at Hull, and fish from Hull altogether.

9358. Then the number of vessels you have given includes a greater number of vessels than hail from Brixham?—I don't know where they hail from; they don't fish here.

9359. Then the average number that fish here is between 80 and 90?—Yes.

9360. (*Professor Huxley.*) You said that 42 fish from Hull?—41 are at Hull, and there are 16 in Ireland.

9361. Permanently in Ireland?—Yes. There are three at Liverpool, one at Plymouth, and another at Ramsgate.

9362. (*Mr. Caird.*) That makes up the whole number to 152?—Yes.

9363. Have you any record which will show us whether these numbers have increased or diminished during the last few years?—They have increased considerably during the last six or seven years.

9364. Do you know the cause of that?—Five or six years ago trawling became very profitable, and there were a number of new vessels built. They were built of a larger size than formerly. Before they ranged from 26 to 30 tons new measurement, but now they go from 36 to 41 and 42 tons. The vessels of the present day will be from 60 to 70 tons builder's measurement, and they will range in length of keel from 48 to 54 feet.

9365. You say that trawling became profitable five or six years ago?—Yes.

9366. In what way did it become profitable; was it from an increase in the take of fish, or an increase in the price, or from both?—From both.

9367. Has it continued to be profitable in the same degree?—Yes, as far as I am concerned. I have no cause to complain. I am interested in two of the vessels.

9368. You find they continue equally profitable?—Last year they were not so profitable as the year previous and the year before that.

9369. Was there any particular cause for their becoming so profitable six or seven years ago?—No; perhaps the railway communication tended to increase the price of fish in the market by diminishing the price of carriage.

9370. It provided a better outlet for the fish?—Yes.

9371. Perhaps more people would buy it?—Yes, and if there were more buyers it would increase the price.

9372. Do you think it would increase the number of fish?—No, I don't see how it would do that, but it would increase the price.

9373. Did it not increase the number of vessels going into the trade five or six years ago?—Yes, certainly it would cause an increase in the number of the vessels. Being found to be a profitable investment, and that the fishermen made more earnings, there would be more vessels put in the trade.

9374. Then do you think the increase of vessels would increase the supply of fish?—The increase of the number of vessels would perhaps increase the supply of fish.

9375. You don't think the increase in the number of vessels would result in diminishing the fish?—Certainly not.

9376. That has not been the consequence of the increased number of vessels?—No.

9377. Has the increase in the number of the vessels caused a diminution in the price of the fish?—No, there has been no diminution in the average earnings of the vessels.

9378. Therefore there must have been an increase of supply, or an increase of price?—Yes.

9379. Then you think an increased demand would be met by an increased supply?—Yes, that will be met by an increase of vessels; there would be an increase at once.

9380. That was the case five or six years ago?—Five or six years ago the increase of vessels was considerable. You were asking just now some questions in reference to vessels being mortgaged. Now, all the mortgages upon vessels are registered in the books of the society and come under my notice. In fact, I am the only one allowed to see the book, but I may say that there are only a few mortgages of any amount recorded in our books at all. At certain times when new vessels have been built, a fisherman may have had 100*l.* or 200*l.* upon his vessel. There have been such things as 200*l.* or 300*l.* recorded, but with these exceptions the mortgages here are very few.

9381. You are talking now of vessels from this port?—Yes; all the vessels insured at Brixham, the whole of the 152.

9382. If there are other mortgages on the vessels the mortgagees must have great confidence in the men as they don't record them?—The advantage of recording a mortgage is that the society guarantees to the mortgagee the same privilege as to the owner.

BRIXHAM.

W. Calley.

10 Oct. 1863.

9383. Do you think in some cases it is not thought necessary to resort to that safe ground?—If they don't resort to it they must have great confidence in the fishermen.

9384. Do you find that such mortgages are frequently paid off?—Yes, frequently; I had a notice of one being paid off last week.

9385. Do you find that fishermen begin by not having a share in the vessels and that they gradually become part owners?—One half of the vessels that fish from Brixham now are owned solely by fishermen. When the Commissioners adjourned for a short time a little while ago, I took the trouble to go through the list, and I find that more than one half are owned by fishermen alone. Tradesmen have nothing to do with them.

9386. Does the greater part of that arise from the gradual increase in the prosperity of the fishermen, and not from their having inherited a vessel or a share of a vessel? Do you think it is solely from their own earnings?—Yes.

9387. Then it has been a prosperous business to the fishermen here?—I believe if the business is conducted as it ought to be, on good principles, it would be a profitable business, but any business may be neglected; on the whole it has been a paying trade.

9388. In what proportion are the mortgages recorded to the estimated value of the vessels?—The vessels insured in our society are insured for between 55,000*l.* and 65,000*l.*, upon an estimated value of between 70,000*l.* and 80,000*l.*, and yet there is nothing like 10,000*l.* recorded in the shape of mortgages. I think if I say 5,000*l.* I shall be within the mark. You may take it that three parts of the vessels insured by the society are owned by the fishermen themselves; some own one, two, three, or four, and there are some owned by fishermen who don't go to sea now.

9389. Are there many trawl-vessels lost at sea?—The average in the case of our society is very small.

9390. Is the average smaller than in the case of any other kind of vessels that keep the sea in rough weather?—Yes, our average this last year will not be more than 1 per cent., not since the 1st of January.

9391. Compared with other fishing vessels, do you suppose there is less risk of life by trawling than by any other means?—I should say there is.

9392. Have you any means of speaking accurately upon that subject?—During the last 12 years that I have been connected with the fisheries here the loss of life has been very small; last year, unfortunately, there was a large loss of life at Hull, and a good many vessels were lost at sea, but so far as concerns Brixham the average per-centage of loss upon the sum insured has been very small, not more than from 1 to 1½ per cent.

9393. (*Professor Huxley.*) Then from your knowledge of the affairs of the fishermen you can give an absolute negative to the statement that the trade has been falling off, and that in consequence your fishermen have been obliged to go north?—Yes, certainly.

9394–5. I have a reason for putting the question in that way?—I can certainly contradict it. If they were to fish here for the same number of hours as they do in the north, I think it would pay them much better than to go there. They get more money in the north, but they have to go out on the Monday morning and remain at sea all the week, coming in on the Saturday morning. If they did that here, I am satisfied that they would earn more than on the north coast.

9396. (*Mr. Caird.*) For what reason do they go north?—They go north because they fancy they can get more money. They do in the gross get more money, but their expenses are heavier. Here, instead of continuing to fish during the whole week, the vessels come in almost every night. There, when the vessels leave the port, they are sometimes bound to remain out at sea for a fortnight or three weeks, and they remain fishing the whole of that time. Here, they go out on the Monday morning, and they come in again on the Monday evening; they go out again on the Tuesday morning, and come in again on the Tuesday evening.

9397. From your knowledge of the business of the fishermen, is it your belief that the quantity of trawled fish caught here by the trawlers has increased or diminished?—I don't think it has diminished.

9398. Do you differ from the other witnesses who have been examined at the earlier part of the sitting, as to any kind of fish having diminished. Have soles and flat-fish diminished?—I think there has been a diminution in the soles. Taking the year throughout, they have not been so plentiful as they were; but with regard to the other fish, and especially the poorer kinds, such as the dabs and gurnets, they appear to me to have been greatly on the increase.

9399. Are they brought here chiefly by trawlers?—Yes; in addition to the trawl-boats we have about 20 open boats. They carry two men each, and their average earnings are about 16*s.* or 18*s.* a week each man, taking one week with another, during the summer. I have one myself, and I judge from my own profits. They will go away in about a month's time to Start Bay oystering, and they will remain there all the winter dredging for oysters, bringing them into Dartmouth, and letting them remain there until the vessels take them away in the spring.

9400. Do the hook men do that?—Yes.

9401. Do they find as good a business as they used to do, notwithstanding the trawling?—Yes.

9402. Do you find from your knowledge of the fishing, that the hook men and the trawlers can follow their business together without doing injury to each other?—Yes.

9403. There is no disadvantage caused to the one by the mode of fishing practised by the other?—There is no disadvantage at all, because they don't come upon the same ground.

9404. We have been told that they do?—If possible the hook men go on the rough ground, where they can get conger eels and whitings. They go after them in preference to any other fish. If they can get to rocky ground, or a place where there is rocky ground, they will be there in preference to any other place.

9405. Has the take of fish decreased at all in consequence of trawling?—No.

9406. Has it increased?—Their takes have been as great as they ever were before.

9407. Have they been as good both in quantity and quality?—Yes. I never saw finer fish than those in the market yesterday. Taking the average of the boats, I think they do as well and better than they have done for many years. It was mentioned some time ago that 38 feet was the length of the beam sanctioned by Act of Parliament. I only wish to state that there might be great danger to a vessel if the beam was not in accordance with the length of the vessel itself. As to the size of the mesh it appears to me to be misunderstood; I think the Act allows the mesh to be 3½ inches.

9408. Not 1¾ inch from knot to knot?—When the meshes are pulled together they will be 3½ inches from each external knot.

9409. The law here is quite distinct: "Trawls "shall be made with nets, the meshes of which shall be "at least one inch and three quarters square from "knot to knot along the line." You see it is never measured in the way you suggest?—No, it is from knot to knot; that is the precise definition of it.

The witness withdrew.

J. Milton.

JAMES MILTON called and examined.

9410. (*Mr. Caird.*) Have you been long stationed here with the Coastguard?—About four years.

9411. Was the paper you have handed in to the Commissioners put in during the time you were in the force?—No, before I came here.

9412. The witness who stated that the order came

BRIXHAM.

J. Milton.

10 Oct. 1863.

down from London not to regard the size of the meshes, stated that it was in 1859. It appears from the letter which I hold in my hand that it was in 1858. Did you find this letter in your office?—Yes.

9413. Among the records of the office?—Yes.

9414. There was no other reason for suspending your operations than that which is mentioned in this letter?—No.

9415. I will read the letter:—

H.M.S. Blenheim, Sept. 22, 1858.

(Memorandum.)

The subject connected with restrictions imposed upon the fisheries being under consideration, the Lords of the Privy Council for Trade consider it desirable for the moment, strict observance with respect to trawl nets should not be observed with reference to the size of the meshes.

(Signed) James Scott, Captain.

Have you had any order or direction from your office as to interference in any way with regard to the size of the net, or any other regulations with reference to fishing?—I never had but one. About a month after I joined we found a French fisherman with a mesh much smaller attached to his trawl net than it should have been, and we reported the case to the Customs.

9416. Had you any instructions to regulate you in your proceedings in regard to the fishermen?—No, none at all.

9417. Did you hear it stated to-day that a Revenue cutter had ordered a fisherman outside of Start Bay who had been employed there in trawl fishing?—We have instructions as to the size of the mesh, but we understood the order contained in that letter to supersede them.

9418. It was stated that a Revenue cutter interfered with a trawl fisherman and ordered him out of the bay; have you any knowledge of that circumstance?—No. I believe my inspecting commander has been making inquiries and asking for some Act of Parliament more explicit and plain so that he could enforce the law.

9419. Do you believe that the Act as it stands is defective?—I believe that as the Act at present stands we have no power to prevent them.

9420. To prevent fishermen from fishing in the bays?—Yes, and we understood that the instructions contained in that letter were that we were not to interfere.

9421. You have had no instructions since that letter?—Not subsequent to that.

9422. Had you any instructions to examine the size of the mesh and the length of the beam?—Some years ago, but not recently.

9423. Are you expected to act on them?—No.

9424. Is it part of your duty to see that the fishermen use a certain size of net?—Yes.

9425. Do you examine their nets?—We see them on their beams. We generally see that they are about the size, about $1\frac{1}{2}$ to $1\frac{3}{4}$ inch, in the mesh. After that instruction came down I never concerned myself about them at all, except in one instance, when I reported that they were considerably too small.

9426. That was in the case of the French boat?—Yes.

9427. (*Professor Huxley.*) Do your instructions oblige you to make periodical inspections of the fishermen's gear?—No.

9428. Suppose you were to make a report to your commanding officer, would he notice the omission of the inspection of fishing nets?—No; we are expected to visit them if there is anything wrong, and then we report to our commanding officer.

9429. Do your instructions make it incumbent upon you to pay visits at any particular time to the fishermen's boats?—No; only in our rounds we may go onboard. We may go onboard if there is anything wrong.

9430. You would hardly see that anything was wrong unless you were onboard, would you?—We can see the nets when they haul them up in the harbour.

9431. But it would be difficult to find out whether the mesh was of the proper size unless you went onboard; is it part of your duty to see that the meshes are of a certain size?—Yes, but it has not been attended to in consequence of that order.

9432. Did you consider that order suspended your operations?—Yes.

9433. So that the whole Act of Parliament has been a dead letter since 1858?—That is so far as we understand the matter, but we don't know whether we have been right or wrong.

9434. If any person came to you and said "So and "so is fishing with a trawl-beam 40 feet long and a net "with meshes $1\frac{1}{2}$ inch from knot to knot," would you feel it to be your duty to go on board and see for yourself?—Yes, I should report the case to the Custom House.

9435. Would you not of your own motion go and examine the beam?—If I believed that anything was wrong I should examine it.

9436. But this order says you are not to be strict in your observance of the instructions; and though it does not say you are to pay no attention to them, that opens a very wide door?—I understood it to mean that I was to pay very little attention at all.

9437. Then, practically, that order does suspend the operations of the Act?—It has generally, so far as I have been concerned, except in the one instance I have mentioned.

9438. But notwithstanding if any person had brought a case under your notice you would have felt bound to act as the law directs?—Yes, I should have reported the case to the Customs.

9439–40. Would the Customs or the magistrate have received any intimation apart from you?—Do you mean apart from the Customs? I am ordered not to give it. I am bound to report to the Customs first. I cannot enter into civil prosecutions, that is done by the Board of Customs. I could only give my evidence.

The witness withdrew.

The inquiry was then adjourned until Monday, October the 12th, at Torquay.

Torquay, Devonshire, Monday, 12th October 1863.

Present:

James Caird, Esq., M.P. (Chairman). | Professor Huxley, F.R.S.

TORQUAY.

W. R. G. Palliser.

12 Oct. 1863.

Wray R. G. Palliser called and examined.

9441–2. (*Mr. Caird.*) You are a commander in the Royal Navy and inspecting commander of the Coastguard here, I believe?—Yes.

9443. Have you received any instructions from your department as to the conduct of the fisheries on this coast?—None, further than the Convention and the various papers which I now produce.

9444. Has a copy of the Convention been forwarded to you officially, in order that you may carry into effect its articles?—A copy was forwarded to my predecessor.

9445. Are the same instructions continued to you?—The same instructions are continued to me.

9446. Have you had occasion to carry the articles of that Convention into effect?—Yes.

9447. Can you give any instance or instances in which you have found it necessary to do so?—Yes.

9448. Will you be so good as to state them?—Upon

TORQUAY.

W. R. G. Palliser.

12 Oct. 1863.

one occasion a fisherman at Torquay, named Tucker, complained to me that a Brixham trawler had trawled away his mackerel drift-nets.

9449. How long is that ago ?—I think about three months ago. The man made a complaint to me that the trawlers came in, and that although he hailed them they still went on trawling, ultimately cutting through his net and destroying it.

9450. He had a mackerel net set at the time ?—Yes, he was fishing with a drift-net.

9451. And was his boat at his net ?—Yes.

9452. The trawler passed through his net ?—Yes, though he was hailed by the fisherman several times.

9453. Were the name and number of the trawler taken ?—Yes, the name was taken, and I believe the man got a few shillings as a recompense from the owner of the trawl-boat.

9454. Did he accept that as full compensation ?—He accepted it, but I heard him say afterwards that it represented nothing like the full amount of the damage which had been done to his net.

9455. That is an instance of damage done by a trawler to a mackerel net-fisher ?—Yes, in Torbay. I made a report of the circumstances to the Board of Trade.

9456. Have you any other instance you can bring before us in which you think there has been some breach of the regulations ?—On various occasions I have had complaints from the fishermen on this coast. For instance, the Start Bay fishermen state that the trawlers are constantly coming in on their ground trawling, and carrying away their lobster pots.

9457. Was the complaint that they came within distances beyond which you think they are excluded by the regulations, or was it that they had damaged the lobster pots ?—They were trawling in my opinion on ground where they had no business to be.

9458. Can you show us any regulation that excludes them from any particular ground ?—Nothing further than the Convention itself. My idea of the Convention was, that it prohibited them from trawling within three miles of the coast; but since I have been in this room I have been given to understand that that impression is erroneous.

9459. Will you be kind enough to refer to the clause which you think operates in the manner you have mentioned. You have no instructions other than those contained in the articles of the Convention, have you ?—No, none.

9460. I believe you construed the second article of the Convention to mean that you had a right to interfere with trawl-fishing within three miles of low water mark ?—Yes, but I find that I was wrong in that. If I had punished a trawler in any way it would have been under that article, and the construction I placed upon it. But with regard to trawling where drift-nets are, I think there is an article which says that the trawlers are not to fish within a certain distance of the drift-nets. On looking at the Act closer I find that I was erroneous in regard to the trawlers fishing within three miles of the shore.

9461. Let me refer you, Captain Palliser, to the 26th article of the Convention. That article says : "Whenever herring or mackerel boats shall Commence drift-net fishing in any place whatever, the trawl-boats which may be already fishing in such place shall depart therefrom, and shall keep at a distance of at least three miles from the said drift-net herring or mackerel boats." Was it under the 26th article that you thought it your duty to interfere with the trawler because he was at that time coming closer to the drift-net or mackerel boat than the law sanctions ?—Yes.

9462. It was under that article that you thought it your duty to interfere ?—Yes.

9463. Not that you thought it your duty to interfere to exclude him altogether from the three-mile limit, but because he was coming in contact with a mackerel boat ?—Yes, and because that was a breach of the 26th article of the Convention.

9464. Do you consider that you have no authority to order trawlers out of the bay, except when they come in contact with herring or drift-net mackerel boats ?—No, I have no orders that authorize me to do so.

9465. Do you know whether at any time trawl-vessels have been warned out of the bay under that belief, by yourself or any officer under your command ?—Yes, I have done so myself, and so has the commander of the cruiser here.

9466. You did it under the belief that you had such authority ?—Yes, we always understood that we had the power to send them away within a certain distance. The reason we took notice of the matter was, that we had had so many complaints from the other fishermen against the trawlers, and really what little fish they did get when they came close in-shore was not worth their while.

9467. You thought it was good for the fishery to order them out ?—Yes, certainly.

9468. And you believed that you were acting under some authority that you possessed ?—Yes.

9469. Did the trawlers leave the bay ?—No, though I warned them myself.

9470. Have the trawlers, in consequence of your warning, left the bay ?—No, they have refused, and have gone on trawling.

9471. They have never been forcibly expelled from the bay ?—No, I never forcibly expelled them.

9472. Has that occurred within a recent period ?—Yes, about two months ago.

9473. Have you any reason to know of your own knowledge that the trawlers do injury to the fishery by trawling in the bay ?—Yes, I think so.

9474. In what way do they do injury ?—I am almost certain that most fish come into shoal water to spawn on the mudbanks and the sandbanks; they deposit their spawn there in shallow water, and when the trawlers trawl over it they tear it up.

9475. Have you ever seen spawn drawn up by the trawl ?—No, I have not; I never examined sufficiently close to see whether spawn was there or not, but I have seen large quantities of very small fish brought up dead, sticking to the trawl net and entangled with seaweed; they were small fish, of no use whatever for the market.

9476. Or for human food ?—No.

9477. Were they thrown overboard ?—Those that I saw were sticking dead in the trawl; I have seen them in a dry trawl.

9478. Was it in the warm summer months or in the cold and winter months ?—It was about this time of the year.

9479. It has been stated to us by the trawlers themselves at Brixham, that they think it would be of advantage to the fishery that they should be excluded from the bays in the warmer months, but be allowed to fish in them in the colder months; they tell us that they would do no injury in the colder months, as there are then very few small fish to be found in-shore, and it would be a great convenience to them to be allowed to fish in the bays in stormy weather when they cannot get out to sea. What is your opinion upon that point ?—I think that they get a very small quantity of fish that is marketable in the bay—close in the bay.

9480. Do you mean in the cold weather ?—At this time of the year. I think they only come to trawl in the bays when it is blowing very hard outside, and not from being enabled to get more fish; they don't like to stop out in bad weather.

9481. You cannot from your own personal knowledge speak as to the difference of seasons; you cannot say whether in cold weather it might be less injurious than it would be in warm weather ?—My own opinion is that at this time of the year, namely, the cold season, the fish come in to spawn in shallow water.

9482. Do you think that in the cold season, by trawling in the bays, the fishermen destroy the spawn ?—I may be wrong, but I certainly think so. I think that the fish come at this time of the year in-shore to deposit their spawn.

9483. Have you had occasion to direct an examination to be made with regard to the size of the mesh of the trawl nets ?—No.

TORQUAY.

W. R. G. Palliser.

12 Oct. 1863.

9484. Has there been an instance of any interference by the Coastguard in enforcing the regulations of the Convention as to the size of the meshes?—No; it would be too great an undertaking once to begin that, because I believe there is scarcely a legal trawl in Brixham or Torquay.

9485. Have you any further instructions to guide you on that point?—None, further than the Convention.

9486. You are aware that in 1858 there was an official instruction given to suspend the rigid execution of these regulations?—Yes.

9487. And since that time I suppose they have practically been a dead letter?—Yes.

9488. With regard to the other details of the Convention, as to the use of distinguishing flags or vanes on the boats, is there anything of the kind observed here?—In Brixham and Torquay the trawlers seldom carry any flags. They have their numbers on their sails and vessels. We enforce that regulation if ever we see them without a number.

9489. (*Professor Huxley.*) The report I hold in my hand, Captain Palliser, was made by your predecessor here, Captain Hoblin?—Captain Hoblin was the commander of the cruiser, the predecessor of the officer here. That report was made before I joined. The Coastguard was then under another inspecting commander. I imagine that that is a copy of the report that was forwarded to the Board of Trade by the coastguard officer.

9490. The commander of the cutter is likely to know more about that report than you?—Yes.

9491. Is this a copy of the return sent in by your predecessor?—Yes.

9492. I observe that the date of it is 1858, but there is no month or day mentioned?—No.

9493. Then you do not happen to know whether this preceded or succeeded the letter sent to Brixham, which virtually suspended the regulations contained in the Convention?—No, I know nothing further about it than that I found it in the records of the office.

9494. I perceive that it contains a copy of the articles of the Convention, and a space for two answers under the following heads—first, "To what extent and within "what limits are the regulations enforced?" The second head comprises "observations and suggestions "including reasons where the regulations are not "enforced." On turning to trawling, I find that the commander states "the trawls of the Brixham trawlers "are not all made the required size, namely $1\frac{3}{4}$ inches "from knot to knot." Then, under the head of "observations and suggestions," including, "if the "regulations are not enforced, the reasons," I find the following: "When the treaty was made in 1839, the "Brixham fishermen memorialised and obtained per-"mission to use their trawl nets until they were worn "out, and the meshes have been made a little larger "since." Have you a copy of that memorial?—No.

9495. I find no remark in this report in reference to the length of the beam. The commander does not appear to have observed that the beam was too long?—No.

9496. Was any action taken on that report or not?—I think not, or I should have had a copy of the proceedings that were taken, or at any rate of the result.

9497. If the letter we saw at Brixham was written subsequent to this, it would seem as though the authorities had made up their minds to take no notice of any infringement of the law?—I cannot say how that was.

9498. (*Mr. Caird.*) You reported your having interfered with the trawl-fishing in the bay to your superior authority?—Yes.

9499. Did anything follow in consequence of that report?—I had no further instructions.

9500. You reported to the Board of Trade?—Yes.

9501. And you had no further instructions on the subject?—No; I applied for instructions other than the instructions contained in the Convention.

9502. And what reply did you get?—No reply was sent to me.

9503. How long is that ago?—It was within the last year, perhaps it would be this year; at any rate it was within the last 12 months. Perhaps I may be allowed to state in reference to interference with the trawlers trawling in Start Bay, that on account of several complaints we had received from other fishermen we thought it only fair that we should exert our authority in order to secure fair play between the different classes of fishermen.

9504. That was in Start Bay, not Torbay?—In Torbay also, but particularly in Start Bay. I was in that bay one day when it was blowing hard, but not too hard to allow the fishermen to work; I saw some 15 or 16 trawlers bear up and run into the bay within a couple of miles of the shore. I certainly thought that was something hard upon the other fishermen, who get their livelihood with their seine nets and lobster pots in shallow water. We told them that they ought not to be there, but they took no notice of us. That was in Start Bay.

The witness withdrew.

JOHN HUGHES called and examined.

J. Hughes.

9505. (*Mr. Caird.*) You command the Revenue cutter here, I believe?—Yes; the "Wickham."

9506. Have you been long on this station?—About two years or more.

9507. Have you had occasion to observe the mode in which the different kinds of fishing are practised on this coast?—I have.

9508. Can you tell us, particularly in regard to the trawl-fishing and the Brixham trawls, whether you have noticed the trawl drawn up to the surface?—I have.

9509. Have you frequently seen it?—Yes, frequently.

9510. In the deep-sea or close in-shore?—Both inshore and out at sea.

9511. Speaking first of the deep-sea trawling, have you observed whether many of the fish, when they are brought to the surface, are mangled or dead?—Plenty of times I have seen them dead. If the trawl has been trawling long on the ground one half the fish will be dead.

9512. One half of the whole number will be dead?—Yes.

9513. Chiefly the small fish?—Yes.

9514. Not one half in weight, but in number?—Yes.

9515. Have you observed a larger proportion of small fish brought up by trawling in the deep sea, or in shallow water?—More are brought up in shallow water.

9516. Has it been only when they have been trawling long in the sea or in stormy weather that you have observed a large quantity of dead fish?—It has been generally when they have been trawling for six or eight hours over the ground. Sometimes they have to trawl and heave up at short intervals, and then the fish are nearly all alive.

9517. Have you observed whether these small fish are thrown overboard?—Mostly they are; the very small fish are thrown overboard. After they have rounded Berry Head they generally clear the deck, and the small fish are then thrown overboard.

9518. What proportion of the take would be small fish? Can you give it to us in basketfuls?—Sometimes there is a basketful, at other times there may not be a basketful.

9519. What proportion of the take would be unmarketable fish and thrown overboard?—More than one half in number; perhaps two thirds would be small fish.

9520. How many basketfuls of fish have you seen taken up in a trawl net?—Sometimes six or eight baskets at a time.

TORQUAY.

J. Hughes.

12 Oct. 1863.

9521. Of these six or eight baskets what proportion would be thrown overboard as unfit for food?—They do not throw it overboard always when I am by, but when they come to their moorings at Brixham I have seen the small fish floating away.

9522. What proportion?—I can hardly say that.

9523. Would it be one basketful out of eight?—Yes, there would be quite that.

9524. That occurred chiefly in bad weather when the trawl was down for a long time?—Not always in bad weather. They sometimes catch a quantity of small fish in fine weather.

9525. You are speaking of the deep-sea trawling now?—Yes.

9526. With regard to the in-shore fishing, what proportion of the fish will be small fish in a take as compared with the large fish?—Not so much, because they do not trawl so long in shallow water as in deep water. I have often seen plenty of small fish, but I cannot say what they throw overboard. They get more of the small flat-fish near the shore than of any other kind.

9527. Are they in such a state as to require their being thrown overboard as unfit for food?—Yes, the very small ones.

9528. Do they form any large proportion of the whole catch in weight?—They are hauled up along with them. If they catch about three or four baskets in the bay, there may be half a basket of small fish.

9529. Have you observed any spawn drawn up in the trawl net?—I have not seen it drawn up, but I have seen it swimming about, particularly in a line with Berry Head.

9530. Had it been drawn up by the trawlers?—No; it was floating in the water. I have taken baskets of it up, and found life in it.

9531. Had it been disturbed by the trawl nets?—I don't know whether it had or not.

9532. You have seen it irrespective of the trawl-vessels?—Yes; I have seen that spawn floating in different parts of the Channel on the surface of the water.

9533. It has been stated that the nets in the bays disturb and injure the spawn, and drag it up?—Yes.

9534. Have you seen spawn in these nets?—I have seen fish two or three inches long, but not the spawn itself.

9535. Is it your belief that the spawn is disturbed by the trawl nets in the bays?—Yes.

9536. On what do you found that belief?—In consequence of the very small fish being taken up, particularly by the shrimp nets which are hauled in-shore. Small fish, not half an inch long, are got in that way, and when they are hauled ashore they are nearly all dead.

9537-8. Have you ever ordered any of the trawl-boats out of the bays?—Yes, I have, at different times.

9539. Within a recent period?—Yes, within the last two months.

9540. You were then acting on your understanding of the Convention as it was stated by the previous witness?—Yes.

9541. Did the trawlers obey that order?—No.

9542. They paid no attention to it?—No, they paid no attention at all.

9543. What answer did they make?—They said they would haul up directly, but they never offered to do so. On the contrary, they went as far as the tide and the wind would take them, when they hauled up naturally, and not before.

9544. Did they leave the bay then?—No, they would dodge about waiting for the tide to come the other way.

9545. Did they consider that you had no authority to give them that order?—They told me so.

9546. Have you ever observed any damage done by the trawl-vessels to the drift-nets?—No, except that the Torcross lobster boats have lost a lot of their lobster pots in consequence of having them taken up.

9547. Have you noticed during the two years you have been on the station whether the take by the trawl-boats has been increasing, diminishing, or stationary?—Sometimes they catch more fish than at other times.

9548. Have you observed whether, in trawling over the same ground repeatedly, the ground seems to become exhausted of fish?—No, I think it makes no difference. If they trawl on the same ground for a full week the fish will be as plentiful next week as ever.

9549. You do not think that the ground becomes exhausted by repeated trawling?—No, I do not think it does with regard to the large fish.

9550. From your practical observation of the matter, do you think it right that any regulation should be adopted to prevent trawling within the bays?—Yes, but outside the headlands I don't think any harm is done.

9551. Do you think that the same quantity of fish could be brought to market by any other means?—Yes.

9552. By what other means?—If they were not allowed to come within the bays I think they would get as many fish by trawling outside.

9553. But if trawling were put down altogether, do you think there are any means by which as many fish could be brought to market?—No.

9554. The same quantity could not be supplied by line-fishing?—Certainly not on this part of the coast.

9555. From your knowledge of the coast, you do not find that the grounds on which trawling is principally practised are giving way in the production of fish?—No.

9556. Have you observed the trawlers following each other in their fishing, one after the other?—Yes, I have frequently seen them fishing one after the other.

9557. Almost in the same line?—Yes, nearly in the same line.

9558. Day after day?—Yes.

9559. You have not found that the first boat got the best haul?—Not at all; very likely the last boat would get as good a haul. I have been on board several of them particularly on the ground outside Plymouth. There they trawl 30 or 40 in a line, and the last boat will come up full of hake. They are a fish that swim much faster than the turbot, sole, or brill.

9560. Is that one particular ground that has long been fished?—Yes, it has been fished as long as can be recollected.

9561. Is it a well defined spot of ground with which the people are well acquainted?—Yes, it is a very narrow piece of ground. The fishermen know it perfectly well. There is rough ground on each side of it.

9562. What is the length and breadth of it?—I do not exactly know, but they tell me it is very narrow.

9563. How many trawlers have you seen following each other on this piece of ground?—I have seen 20 or 30 of them in a line.

9564. Have you observed what quantity of fish they catch in a day on that ground?—Sometimes great quantities of hake. Each vessel will catch several scores.

9565. In the course of the two years you have been on this coast, have you observed whether there has been an increase in the number of vessels fishing on that ground?—No.

9566. Have you observed whether there has been a decrease?—I cannot say. I don't think there has been much difference.

9567. Did you see any French or foreign vessels come to fish on these grounds?—Not trawling. I have seen them long-lining off the Eddystone and the Plymouth grounds.

9568. Have you ever observed long-lining and trawling going on at the same time?—Not about here.

9569. Have you ever heard any complaint made by the long-line fishermen of the injury done to them by the trawlers in deep water?—No.

9570. All the complaints you have heard have been confined to the injury alleged to have been done in shallow water, within the bays?—That is all I have heard.

9571. Within what limit from the shore do you think it would be proper to exclude them?—If they were clear of the headlands, say two miles off the Berry Head, they could not do much harm then.

9572. You would draw a line two miles outside of the headlands?—Yes.

9573. That would exclude them from the bays?—Yes.

9574. Would that meet all the objections that could be reasonably entertained by the in-shore fishermen?—Yes. The trawl fishermen have told me themselves that they wished there was an order to keep them out of the bays. But there are several old vessels—they do not like to take to sea—which trawl and get a good catch, and if the others have not been similarly fortunate the owners find fault with them for not having been out trawling.

9575. (*Professor Huxley.*) You spoke just now of the spawn floating on the surface of the water. Do you know that it was fish spawn?—Yes, I have seen it for many years, particularly in Rye Bay, and on the Kentish coast. I have seen it picked up in buckets.

9576. But how do you know that it is fish spawn?—It was not birds' or anything else.

9577. But there are a great many things in the sea besides fish?—I have no doubt in my own mind that it was fish spawn.

7578. Have you seen any fish in it?—Yes, cuttle-fish.

7579. Young cuttle-fish?—Yes, like a bunch of grapes; but the other spawn was too small to make out much life in it. I have seen it alive however when it has been hauled up.

9580. But that was not likely to be fish. With regard to the tackle of the trawlers, if you went alongside of a trawler and found that her beam was 50 feet long, would you deem it your duty to take any notice of it?—No, if I had no orders to that effect.

9581. Are you aware what the rule of the Convention is?—Yes.

9582. That the beam is not to be more than 38 feet long?—Yes.

9583. Then if you observed a beam 40 or 45 feet long, would you not feel called upon to take any measures with regard to it?—I have not done so hitherto. I see from the Convention that they are not allowed to have their beam so long as that.

9584. My object is to ascertain how the Act works in practice. I want to know if you would feel yourself called upon to interfere or not?—I think I should.

9585. If you go into Brixham Harbour you will find all the beams more than 38 feet long?—Yes, I believe so.

9586. Have you ever intefered with any of them?—No.

9587. Then in fact you do not feel called upon to interfere?—No.

9588. Do you consider that your instructions call upon you to carry out the Convention, or do you think it is in abeyance?—I can hardly answer that.

9589. Practically, you do not carry out the Convention?—No.

9590. I understand that you never received any special orders, directing you to carry out the regulations contained in the Convention?—No.

9591. Was the letter which I hold in my hand received before your time. It is a document signed "Houston Stewart," and is dated the 10th of May 1847. It says:

"In consequence of directions from the Lords of the Committee of Privy Council for Trade, signified by Mr. Lefevre's letter of the 28th ultimo on the subject of enforcing the regulations referred to in the Board's general orders of the 17th February 1844, No. 14, and subsequent order for carrying into effect the Convention between Her Majesty and the King of the French concerning the fishermen in the seas between the British Islands and France.

"I have it in command to direct you and the several officers under your survey to continue to carry into effect the regulations now in force in regard to these fisheries.

"The aforegoing copy of a letter addressed by the Board to the collectors and controllers of the out-ports in England and Scotland is herewith transmitted for the information and guidance of the inspecting commander at Dartmouth.

"Houston Stewart,
"Coastguard Office, Controller General."
"Carlton House, London, May 10, 1847."

Now I take it that you would understand that to be an instruction to carry into effect the Convention?—Yes.

9592. Do you suppose that your predecessor here acted upon that; are you aware that any prosecutions were instituted by him or any seizure made?—No, I never heard that there were.

9593. Nothing of the kind took place?—No.

9594. You are doubtless aware of the existence of this letter?—Yes.

9595. Though you did not think it compelled you to enforce the regulation minutely?—No.

9596. Was that in consequence of any other document having made its appearance besides this?—No.

9597. Have you received any other instructions directing you not to carry the provisions of the Convention strictly into effect?—I have a copy of a letter in my order book.

9598. Is that the letter we saw at Brixham?—I think so. We have a copy of it in our order book.

9599. Then practically it comes to this—that at present the Convention is suspended here?—Yes.

9600. (*Mr. Caird.*) Speaking practically in regard to the length of the beam of the trawl, do you think it would be right to limit the fishermen to the precise length of 38 or any other number of feet?—I do not think that that would make any difference in taking out small fish.

9601. But does not the convenience of having the beam a certain length depend on the length of the vessel itself?—Certainly it does.

9602. Is it not necessary for the safety of persons fishing in a trawler to have a larger beam in a larger vessel than in a small one?—Yes.

9603. So that it might be checked in its motions backward and forward by the backstay of the mast?—Yes.

9604. Then it would not be practicable to enforce any particular length of beam except in accordance with the length of the vessel?—No.

9605. If you were to carry out your instructions and seize every beam that was above 38 feet long in Brixham would you not inflict a deep injury on the fishermen there?—Yes.

9606. An injury that would not be compensated by any corresponding advantage?—Yes.

9607. (*Professor Huxley.*) There are a great number of rules contained in this Convention, but here is one that I will read to you, namely, that "trawl-"boats shall always keep at a distance of at least "three miles trom all boats fishing for herrings or "mackerel with drift-nets." Is that a rule that can be conveniently enforced?—No, I don't think so. A trawler may be trawling in the night time when a drift-net boat may put off and shoot his net close to him. I don't see how that can be stopped.

9608. If you were called on to enforce these rules, do you think, as commander of the cutter here, that you could carry that particular rule out?—No, I think not.

9609. Is there much herring-fishing going on here?—No, I do not think there is on this coast; but after you get to the westward of Bolt Tail then the Plymouth and Cornish boats come in.

9610. Do the trawl-boats here have vanes at their mast-heads?—Some of them have a little bit of a flag.

9611. You are aware that there is a rule on that subject?—Compelling them to carry vanes?

TORQUAY.

J. Hughes.

12 Oct. 1863.

9612. Yes; they are bound to carry vanes of a particular colour?—No, I was not aware of that.

9613. That is not a regulation that is attended to?—No.

9614–5. There is another rule here with regard to herring boats, when the herring-fishing is going on, that "whenever decked herring boats and "undecked herring boats shall commence shooting "their nets at the same time, the undecked boats "shall shoot their nets to windward of the decked "boats, except they should prefer going to leeward, "to a distance of at least half a mile, to shoot their "nets." The next article says: "The decked boats "on their part shall shoot their nets to leeward of the "undecked boats, unless they prefer going to wind-"ward, to a distance of at least half a mile, to shoot "their nets." That is to say, that decked and undecked boats shall not shoot within half a mile of each other. Do you think these regulations can be carried out in practice?—I can hardly see how it is possible to carry them out. Very often it is dark before they begin, and it would be impossible to see which of the boats were decked and which were undecked.

The witness withdrew.

R. Slade.

ROBERT SLADE called and examined.

9616. (*Mr. Caird.*) You are harbour master here?—Yes.

9617. Have you been long in that position?—About nine years.

9618. Can you tell us the number of men and boats engaged in the fishing at Torquay altogether?—Yes; there are about 20 boats engaged in the hook-and-line fishing, and probably about a dozen more employed with nets and in the seine-fishing.

9619. Have you observed during the time that your attention has been directed to it, whether there has been any increase or diminution in the numbers?—There has been a decided increase.

9620. Have you observed whether the quantity of fish they catch is increasing or diminishing?—I should say that it increases.

9621. Does that apply to all kinds of fish, or to any particular kind especially?—I allude particularly to the hook-and-line fishing. I think it is rather on the increase, and that is the opinion of the hook-and-line fishermen themselves.

9622. They are making a better business of it?—Perhaps the quantity may not increase very much, but it pays them better than it did 15 or 20 years ago. The price is now much better.

9623. Is there a marked difference in the quantity that the boats bring ashore?—I think they bring more ashore now.

9624. Are the fish themselves as good in quality?—I should say they are pretty much the same. I cannot say, nor do I mean to say, that the number of fish in the bay has actually increased, but the tackle now employed by the fishermen is better than it was, and they catch more.

9625. Their success is greater in consequence?—Yes.

9626. Do they follow the hand-line or the long-line fishing?—The hand-line fishing.

9627. Is there any long-line fishing here?—No, except by gentlemen amateurs.

9628. Do they fish in the bay or outside?—Principally outside.

9629. In the same depth of water as the trawlers?—Yes.

9630. Do they go on the same ground as the trawlers frequent?—They shift according to the season, but they go on the same ground as the trawlers.

9631. Have you ever heard them complain that the trawl fishermen injure their fish?—I have not heard the hook-and-line fishermen complain, but I have heard those who use nets say that the trawlers interfere with their fishing, and that it is scarcely safe for them to leave their nets out at night now, as the trawlers are in the habit of trawling the bays and they frequently lose their gear.

9632. You say that the hook-and-line fishermen do not complain?—I never heard them.

9633. And they practise the largest proportion of the fishing here?—Yes.

9634. Are they on the whole the most successful class of fishermen?—No; I think the net fishers are.

9635. What kind of net-fishing is practised here?—Herring, and mackerel, and pilchard-fishing, but the herring is the principal.

9636. Is herring-fishing here a successful business?—I think on the whole it is.

9637. Has it been increasing or diminishing here?—It varies considerably. There may be one or two years very successful years, and then they may be followed by years of failure.

9638. There has been no marked increase or diminution?—No.

9639. In what months is the herring-fishing generally followed?—From October till the end of December is about the time.

9640. Is it within the bay that they fish or do they go outside?—In this bay and in Babbicombe Bay; they go to both.

9641. Do they come in contact at all with the trawl fishermen?—Yes, the trawl fishermen come in contact with them.

9642. Is that to the injury of their nets?—Yes.

9643. And is it that of which they complain?—Yes.

9644. They do not complain that the fish has diminished by trawl-fishing, but of the injury done to their tackle?—Yes; there is a class of small boats that use the bay for crab-fishing. I have heard them complain that the trawlers have been in the bay and have destroyed the small fish.

9645. But the net-fishers complain not that they fish in the bay, but that they foul their nets?—Yes.

9646. What kind of fishing is practised by the small net fishermen within the bay?—They are not small net fishermen, but they go in open boats, and either row or scull out. They complain that the trawls injure the ground upon which they catch flat-fish.

9647. Are there many boats engaged in that way?—Seven or eight, or perhaps half a dozen will be about the average.

9648. What kind of fish do they catch with the hook-and-line?—Dabs principally. I have known them get a good deal at times.

9649. Have you observed whether the quantity they now catch has diminished within recent years?—I cannot say I have.

9650. On the contrary, can you say they have not diminished?—I have heard complaints, but I have not noticed any difference in the quantity of fish caught by them.

9651. What is the nature of their complaints?—They complain that their fishery ground is broken up, and that the small fish are destroyed or killed by the trawlers.

9652. Do you know personally whether the number of people engaged in that business within the last six or eight years has increased or diminished?—I should say not; I do not know that there has been any alteration. It is a business that is mostly taken up by the old men who are not fit for deep-sea fishing, and who cannot go in the larger boats.

9653. There is still another system of fishing practised in this bay; there is fishing by seine nets?—Yes.

9654. What do they fish for?—They use them during the mackerel season; but the greatest number taken by them is during the sprat season. About Christmas time they catch immense quantities of sprats here; they use a very small mesh for that.

TORQUAY.

R. Slade.

12 Oct. 1863.

9655-6. Are they all caught within the bay?—Yes, the fishing for sprats is limited almost entirely to this bay.

9657. Are there many boats engaged in the sprat-fishing here?—No, there are not many boats, because a sprat seine is an expensive article; there may possibly be four or five such seines belonging to the place.

9658. Have you any notion what quantity of sprats may be caught here in the season?—I cannot say; the seasons vary very much; but I have known as much as 400 tons caught in a season. I have known them to be several days,—two or three days,—dipping out a single seine.

9659. They have been two or three days getting the fish from one seine?—Yes; they had to let them lie from day to day before they could get them out.

9660. Has that particular fishing been increasing or diminishing in abundance?—I don't think it has.

9661. Has it been stationary?—Yes.

9662. Do they cure these fish, or do they sell them fresh?—I think it is a fish that was not known some years since; it has sprung up within the last 15 years. I have not been a minute observer of it, and I think you will get better information from the fishermen themselves.

9663. What is done with the sprats?—The early catches go to London, Bristol, and the large markets.

9664. Do they go fresh?—Yes, they are sent off as they are caught. Later in the season, they are frequently sold for manure. The price comes so very low that it comes within the range of the agriculturist; it would not then pay them to send to London.

9665. Is there any other kind of fish that is caught in these nets at the same time?—Occasionally they get hake, which follows the sprats.

9666. Do they get any large quantity of small immature fish?—I have never noticed that; I should think not.

9667. Is there any oyster fishery here?—Very little; it is very limited indeed.

9668. Has it being increasing or diminishing?—It diminished some years since; there were a great many oysters in the bay at one time, but boats came from Colchester and eastward, and they broke up the ground, and since that time we have had no fishery for oysters of any importance.

9669. Are there any good oyster beds in the bay?—I do not know if there are any at all at present.

9670. Do you think any regulation could be adopted for the protection of oysters that would lead to the increase of oysters here?—If the oyster fishers and the trawling were stopped the oysters might increase. I think the trawling interferes very much with the oyster-fishing.

9671. Do you mean the trawling in the bay?—Yes.

9672. Do the trawls get under the oysters?—Occasionally they do.

9673. Are the oysters of good quality here?—Yes, they are very good fish.

9674. Does anybody claim a property in them?—No, there is no royalty of any sort.

9675. Is there a good crab and lobster fishery here?—No, it is rather indifferent, and it has diminished of late years.

9676. Have you heard any reason assigned for that diminution?—No, I have not.

9677. Is there a prawn fishery here?—Yes, but it is very limited.

9678. We were told that an implement is used here called a horse-trawl?—It is not used here, but it is used occasionally on Paignton Sands.

9679. You use nothing of the kind?—No.

9680. (*Professor Huxley.*) Have you seen that horse-trawl in operation?—Yes.

9681-3. Can you tell us how it works?—I never examined it.

The witness withdrew.

(*Capt. Palliser.*) It is simply a drag with a horse in front of it.

HENRY NIAASS called and examined.

H. Niaass.

9684. (*Mr. Caird.*) Have you long been a fisherman here?—I have been at all sorts of fishing, trawling, netting, and all kinds. I have been for 61 years a fisherman, out and on at times.

9685. Are you at present a fisherman?—No, I just go out to catch a few dabs, but not as a regular fisherman. I have got too old for that.

9686. But you still go out occasionally in the bay?—Yes.

9687. In the course of your experience as a fisherman, do you think that the quantity of fish caught on this coast has been increasing or diminishing?—It has been diminishing a good deal since I first knew it.

9688. Do you think the whole quantity is diminishing, or that it is only diminishing in particular localities?—There is not one fifth part of the fish caught in this bay that there was in my early days, when I was a trawler.

9689. Have you been a trawler?—Yes, I was trawling for nine years.

9690-1. Did you then trawl in the bay?—Yes, but the trawls have very much increased in size since I was trawling. Our beams were not more than 28 feet in length in a 41 ton vessel. Now they have them 46, 47, and 48.

9692. Do you think that these larger vessels with larger beams catch more fish?—Certainly they do.

9693. Then if they do catch more fish, and the number of vessels has increased, how do you account for the quantity having fallen off to one fifth?—So much spawn is destroyed. When I have been trawling in the bay for two hours I have hove up as much spawn as we could turn out with double blocks.

9694. How long is that since?—Thirty or 40 years ago, when I went trawling regularly.

9695. Have the trawlers been trawling ever since in the bay?—Yes. Perhaps I may mention one thing. If you go out in the bay in the spring of the year you may catch a few flat-fish, and perhaps make 5*s.* or 6*s.* by them, when in come these great trawlers. They rake up the whole ground, and you catch no more. It is all done away with.

9696. Have you ever fished on the same ground that the trawlers have passed over?—Yes, hundreds of times.

9697. Have you found no fish there?—No, not after they have been there; they rake the bay all over. There are sometimes eight or 10 of these great vessels trawling over four or five miles of ground. They clear the whole ground.

9698. Do not the line fishermen go out to fish?—No, we don't. It would be of no service to us. We could catch nothing.

9699. Have you been a hook-and-line fisherman?—Yes, and a net fisherman.

9700. Have you been in the habit of fishing with a hook-and-line on the same ground as the trawlers?—Yes, but not latterly.

9701. Can you speak from your own experience as to whether the line-fishing has been injured by the trawl fishermen preceding you on the same ground?—I don't think so. But the hook-and-line fishermen, in the days I am speaking of, some years ago, were very different from what they are now. Where one boat goes hooking now there were 20 then. They catch more of one sort of fish, namely, the whiting, than ever I found in my days. But the fish have not accumulated in the bay as they used to do.

9702. You say there are plenty of fish on the off-ground; are they in greater abundance than they were in your early time?—Yes.

TORQUAY.

H. Niaass.

12 Oct. 1863.

9703. What kind of fish ?—Whiting, and there may be a few cod caught.

9704. Then are there more whitings caught now than there were in former times ?—Yes, but more fishing boats go out to do it, perhaps ten to one.

9705. Does each boat make as good a thing of it as it did 20 years ago ?—They make a better thing of it because the cost of carriage was then terrible. Since the railways have taken the fish, a better price has been got for it. But the town itself has very much increased since then. It was very small indeed at that time.

9706. Then I gather from what you say, that the decrease has occurred in the in-shore fishing, but not in the deep water fishing ?—Not in hooked fish.

9707. You do not think there has been a decrease in the deep water fishing ?—I do not think there has.

9708. It is only in-shore that the damage has been done ?—I don't think there has been any decrease in hooked fishing in deep water, but with regard to trawling there has been a great decrease.

9709. Do you mean that the trawlers themselves do not make as good a business of it ?—Nothing near so good a business as they did in my day.

9710. In your experience, what would a trawl-boat make on the average in a day's fishing ; how many baskets of fish ?—I have been trawling with a 28 or 29 feet beam in a 41 ton boat ; now they have them 60 tons. I have been catching 30, 40, and 50 baskets with 10 dozen hakes at a haul, and now the big vessels do not catch 10 baskets. It is only on very extraordinary occasions that they catch 30 or 40 baskets ; 20 baskets is considered a very good catch, whereas a a boat in my time would occasionally get 50 baskets.

9711. Are you speaking now of what you hear with regard to the trawl-boats of the present day ?—No, of what I have seen. I have been at Brixham, and I have bought a lot of fish, and I have seen what the trawlers have brought in. I have been there many days, and I have seen all that these great fellows bring in.

9712. Do you say that from your former recollection of what they used to bring in in small vessels, the larger vessels now do not bring in such good catches as they then did ?—I am sure they do not.

9713. Do you know anything about the sprat-fishing here ?—Yes.

9714. Do you yourself follow it ?—Sometimes.

9715. How long does it continue ?—Sometimes a month, sometimes six weeks, and sometimes only a fortnight. Occasionally you will only have one catch, and they will go right off.

9716. Does that fishery yield you a good deal of money occasionally ?—Yes, a great deal sometimes. I have seen a boat's seine take 876 baskets of sprats at one catch. That was only in one seine's catch.

9717. Did you send them to the London market ?—They were sent to London, Bristol, Bath, Taunton, Bridgwater, and many other places.

9718. Can you tell us yourself what quantity of sprats may be caught here in a season ?—No, I cannot.

9719. On the whole are they increasing or diminishing, or do they vary backward and forward ?—They vary backward and forward.

9720. There is no certainty about them ?—30 years ago they were not caught at all. There was no sale for them then. It is only within the last 15 or 20 years that they have been caught, and there has been no deficiency of them since we commenced catching them ; they come in in a body. Sometimes they will stop six weeks or a month, and sometimes hardly a day.

9721. Are they found in any particular part ?—They come in occasionally right to Torquay. They lie dead and quiet in a body. We shoot our seines round them and take them all up.

9722. Are they found nowhere else here ?—Round by Bridgwater and about there, they catch them at the Gore, and in other places as well.

9723. Do you salt them when you cannot get a sale for them ?—No, we sell them right off, or we sell them as manure.

9724. Is there a large quantity sold here for manure ?—Sometimes boatloads of them are sold as manure.

9725. What price do you get for them ?—6*d.* a bushel, and sometimes 1*s.* ; I don't know exactly.

9726. Have you any pilchard-fishing here ?—There has been more this year than has been known for many years.

9727. Then the pilchard fishery here has not diminished ?—No, there never were more pilchards this side of Plymouth than there have been this year.

9728. Is the pilchard fishery here a matter of much importance ?—No.

9729. Is the herring-fishing good here?—Sometimes it is very good.

9730. It varies ?—Yes.

9731. Do any French fishermen come here to fish herrings ?—Not that I have seen.

9732. What time do the herrings come ?—They catch them now, and they will remain till perhaps after Christmas, but it is a very uncertain fish.

9733. Do you fish for them whenever they appear on the coast ?—Yes.

9734. Do they come at any other season ?—Sometimes after Christmas, but not in the summer time ; they make off then.

9735. They do not come earlier than October ?—Sometimes they are in earlier and sometimes later. Sometimes we do not catch any till Christmas. It is all owing to the season. The fish strike in better one year than another.

9736. Have you been much employed in the herring fishery ?—Yes.

9737. Have you ever had your nets damaged or destroyed by the trawl fishermen ?—I never had myself ; but I have known others who have had trawlers trawling into their nets and tearing them to pieces. Some meet with a misfortune of that sort every year.

9738. You have had no occasion to complain of that ?—No, I never had any complaint to make with regard to my nets.

9739. Have you been much employed in the mackerel-fishing ?—Very little in the net mackerel-fishing.

9740. Is the net-fishing for mackerel practised here? —Not much.

9741. Is there any large quantity of mackerel caught here ?—No.

9742. Are any large quantities caught by the hook-and-line ?—At times, but it varies a good deal.

9743. Is the variation caused by the trawling ?—No, I do not think that any "flying" fish, such as the mackerel or herring, or anything of that kind, are interfered with by trawling.

9744. Do you think it would be an improvement, and likely to be beneficial to the fishing generally, that all the trawl fishermen should be excluded from the bays ?—I think if trawl-fishing were excluded from the bays, there would be four times as much fish caught as there is now. The fish would come into the bay and breed and rest there, and the trawlers would catch them again when they got outside.

9745. Then you think it would be beneficial to the trawl fishermen themselves ?—Yes.

9746. You have no desire to see trawl-fishing put down altogether ?—Not at all.

9747. Do you think that as much fish would be brought to the market by any other means ?—No hook fishermen could catch the quantity that is caught by the trawlers.

9748. Then, on the whole, you think they should only be excluded from the breeding grounds in the bays and limited to deep water ?—Yes, I think that would be beneficial not only to themselves but to others.

9749. (*Professor Huxley.*) Can you tell me what kind of net is used for sprat-fishing ?—It is a small bunt.

9750. How long is the net?—The seine they catch the sprats in is perhaps 150 or 200 fathoms long.

9751. How deep is it at the ends?—The depth in the bunt is from 28 to 30 fathoms.

9752-3. What is the depth of the wings?—From eight to ten fathoms, some of them.

9754. Is the head line corked?—Yes.

9755. Is the foot rope leaded?—Some are and some are not.

9756. Is there any pocket in this seine?—No.

9757. Explain how it is used. Do they look out, in the first place, for the shoal of sprats to come in?—Yes, they see the sprats, and they shoot the nets round the shoal.

9758. Is one end of the net made fast on shore?—They have an anchor there.

9759. Is the net taken out in one or in two boats?—In one boat.

9760. And one end is made fast with an anchor?—Yes.

9761. Then they pay out the net?—Yes.

9762. And they make a circle round the sprats?—Yes.

9763. Are two boats employed in this, or only one?—Perhaps three or four boats and 10 or a dozen men.

9764. They have the end of the net made fast at the place from whence they started?—They haul away from the foot to the head. They anchor the boats so that they cannot start, and they haul away at the head and foot, and they bale the sprats out into the boats.

9765. In fact, it is circle-net fishing in reality?—Yes.

9766. They don't take them on to the shore?—No, I have never known that done but once.

9767. What is the size of the mesh?—It is very small. You can only just shove your finger through.

9768. Is it half an inch?—No.

9769. Is it one-third. How many meshes are there to the inch?—I can hardly tell; two I should think.

9770. And how long do you say that sort of sprat-fishing has been going on here?—Sometimes it don't last two days, and sometimes it will last a month or six weeks.

9771. I mean how many years has it been practised here?—For 15, 16, or 18 years. Somewhere about that time.

9772. Every winter has there been a considerable quantity of sprats taken on this shore?—Some winters the fishing has been more prosperous than others. Sometimes the quantity taken has been very large indeed. I have known them catch from 10,000 to 20,000 bushels within three or four days. But that is not always the case. On the other hand, I have known the sprats come in here and we have got one catch; then the wind has been northward and they have all gone away directly.

9773. What is the cost of a sprat net?—The cost of a sprat seine is something considerable. I have a real good one, and it cost me 150*l*.

9774. Where are they made?—At Bridport in general.

9775. What are they made of?—Twine.

9776. Are they all sprats that are taken in this way, or are other fish mixed up with them?—They are nearly all sprats. They tuck them up.

9777. Are any young herrings mixed up with them?—There may be a few, but not many. Sometimes the herrings and the sprats come in together, but the herring does not mix up with them. What herrings we generally catch about that time are fine herrings, quite large.

9778. Does the herring fishery take place commonly in the winter time here?—It begins about now, and sometimes later.

9779. Does it last until January?—It does at times, but that is not certain.

9780. It commonly ends in December?—Yes.

9781. In what condition are the fish about December or January; are they full fish?—Do you mean full of spawn?

9782. Yes.—The herrings are full of spawn.

9783. At what time?—In a fortnight or a month's time they will be full of spawn. After they have spawned they are thin and poor.

9784. Do you know what a spent herring is?—Yes.

9785. When do you find them here?—Generally after Christmas they have spent themselves out.

9786. Have you seen spent herrings here in January?—Yes.

9787. Have you ever found full herrings here as late as February?—We might find a few, but not a great quantity.

9788. Is that because you don't fish for them, or because the fish are not here?—We get them in different seasons from Yarmouth, Scotland, and Ireland. Our herrings are a somewhat smaller fish. The Scotch herrings, the Irish herrings, and the Yarmouth herrings are larger, and they get them in greater abundance. We don't get them at the same season.

9789. Here your season is quite at the end of the year?—Yes.

9790. Do you ever get full fish in August?—We seldom catch them in August.

9791. Do you get none then?—A few; a dozen or two; but no great quantity.

9792. What is about the average length of the herrings you catch here?—I cannot say. I never measured them. I have caught some thousands, but I never measured the length of them.

9793. Are they as big as the Yarmouth herrings?—No; they are not as big. The Yarmouth herrings are a finer herring than ours are in general. We have plenty of Yarmouth bloaters here; but the fish we catch are not so large.

9794. What is the size of your herring mesh here?—It is a shilling scale.

9795. The same here as everywhere else?—Yes.

9796. What do you say will be the length of the herrings you catch?—About 9 inches.

9797. Are you catching any herrings now?—They caught some last night.

9798. Are there any to be got in the town?—Yes; you will find them hawking them about the streets.

9799. Is the herring that is being caught now the same as you get all through the season?—They will run finer yet; they are rather small now.

9800. You spoke of the spawn being trawled up. What do you call spawn?—The spawn I mean is regular spawn. I have caught it in the trawl as much as five or six cwt. at a time. It is spawn just as it comes from the fish.

9801. From what sort of fish?—From hakes and all sorts.

9802. Do you know what herring spawn is like?—Yes.

9803. Have you ever got it in your nets?—Plenty of it at times.

9804. Was the spawn you dragged up in the trawl like that?—Yes; I think the principal part of the fish come to land to rub the spawn out. That is the general case I think.

9805. Was the stuff you got up in the trawls like herring spawn?—It was like all sorts of spawn. It was real spawn. If you take it, and boil it, and put it into your mouth, you will find that it has just the same taste as if you were eating mackerel or herring. I have done that scores of times.

9806. (*Mr. Caird.*) What are the different kinds of fish caught in this place?—Dabs, plaice, whiting, and may be, turbot and codfish. When I first began fishing there were no whitings to be caught. Then we began to catch three or four baskets of fine large whitings, and now we hardly catch half a basket.

9807. They are caught in greater abundance outside?—Yes.

9808. What particular kind of fish is principally caught outside here?—Turbot, soles, ling, cod, hake, conger, brill, and all sorts.

9809. Are any salmon trout caught here?—No, They catch salmon in the seine. They come down

TORQUAY.

H. Niaass.

12 Oct. 1863.

the Teign, the Exe, and the Dart. We catch one or two in the season, but not as a general thing.

9810. Is there any salmon-fishing on the sea coast here?—No; not on the sea coast, but there is in the rivers, especially in the river Dart.

9811. Have you never practised any salmon-fishing on this coast by bag or stake nets?—No; not on this coast. We never catch any salmon unless they come down from the river Dart, the river Teign, or the river Exe.

9812. It is not practised here?—If it is practised at all it is practised in the rivers.

9813. But I am speaking of the sea coast fishery?—No; it is never practised here.

9814. Are there any John Doreys caught here?—Yes; several have been caught at the pier in our harbour this year.

The witness withdrew.

T. Harvey.

THOMAS HARVEY called and examined.

9815. (*Mr. Caird.*) Are you a fisherman here?—Yes.

9816. Have you long been engaged in the fishing here?—For 18 years.

9817. What kind of fishing do you practice?—I principally fish with a hook-and-line.

9818. Have you ever been a trawl fisherman?—Not in deep water. I have never been anything but a trawler, with my boat in the bay.

9819. Was that in an open boat?—Yes.

9820. A small trawl?—Yes.

9821. What was the length of the beam?—It was a 21 or 22 foot beam.

9822. Is that practised much in the bay?—Some boats use it.

9823. Have you fished lately with that trawl in this bay?—Not this season. I did last. I generally do every season for two or three months.

9824. And have you found that the quantity of fish you can catch in the bay with that trawl has been increasing or falling off?—It has been falling off.

9825. What is the reason?—I believe it is owing to catching the young fish.

9826. Have you ever caught young fish in your trawl?—Yes.

9827. In large quantities?—Perhaps half the catch in number, I should think.

9828. What did you do with them?—Some are dead, some we heave away, and some we bring ashore and sell; they are about the size of my hand.

9829. Can you find a sale for fish of that size?—Yes; people will buy anything.

9830. Anything sells?—Yes, pretty near.

9831. Do you think that in consequence of your bringing up these small fish the quantity of good fish has decreased in the bays?—Yes.

9832. When you first began what quantity did you get in a fair day's fishing?—I have not been many years at it.

9833. Go back as far as you can?—When we find there is nothing in the bay we don't work it.

9834. But you worked it last year?—Yes.

9835. Did you find anything in the bay then?—Yes, a little.

9836. Was it much different from what it was a year or two ago?—If we don't find fish that will pay us, we don't work it; but we always take up a quantity of small fish, full half the number of the whole catch.

9837. At all times?—Yes.

9838. Have you ever caught any spawn in your net?—I have never taken notice of the spawn myself.

9839. Only of the small fish?—Yes, I have seen them brought up by the trawl about the size of small ivy leaves.

9840. In the line-fishing, do you go on the same ground as the trawl fishermen?—Yes.

9841. Have you observed any increase or falling off in the catch on that ground?—I have not seen any difference.

9842. Do you think it continues much about what it used to be?—Yes, about the same, but I do not know whether it is because we follow it up more.

9843. Can you make as good a catch now as you used to do?—Yes, but I think the fishermen generally follow it up more than they used to do.

9844. Do they find that it pays them better?—They go out in worse weather.

9845. Have they got better boats?—The boats are rather better than they used to be.

9846. Have you for many years gone on the same ground upon which you have observed the trawl fishermen?—Yes, on the same ground the trawlers take.

9847. Have you observed any diminution in the quantity of fish in consequence of the operations of the trawl fishermen?—No, not in deep water.

9848. I am speaking of deep water. You do not find practically that it does any injury to you as a line fisherman to fish on the ground that is frequented by the trawl fishermen?—No.

9849. Have the particular kinds of fish continued very much the same as they were formerly, in your line of fishing?—Much about the same.

9850. You have now the same quantity of turbot and skate and so on?—We don't catch turbot, and we don't catch flat-fish with the hook-and-line; the fish we get are all round-fish—cod, whiting, bream, ling, and conger; we don't get flat-fish at all by the hook-and-line.

9851. Do you use the turbot net?—They catch turbot in the trawl.

9852. You don't use the turbot net?—No, they catch all the flat-fish in the trawl, such as turbots, soles, and brills.

9853. Have you noticed the trawl-boats fishing in deep water?—Yes.

9854. Have you observed what they bring up in their nets?—I never boarded them, but I have been alongside of them when they have hauled up their net, and I have seen them when they came to shoot their rubbish on deck; I have seen that they had a great quantity of small fish.

9855. Do they sell it?—No, they shoot it overboard; it would not sell.

9856. I thought you said that anything would sell here?—Yes, in small quantities, but they have too large a quantity.

9857. Does it appear to be damaged and rendered unsaleable?—Yes.

9858. By the trawl?—Yes. Sometimes they heave up a ton or two tons weight of mud and dirt in their trawl, and the fish are intermixed with that.

9859. Do you fish for sprats sometimes?—Yes.

9860. Do you ever get large quantities?—Yes, in the seines.

9861. Do you notice whether the sprat-fishing is increasing or diminishing?—At some seasons sprats are very slack, and at others they are very plentiful.

9862. It varies very much?—Yes.

9863. It does not depend upon any particular mode of fishing?—No.

9864. Do you practise lobster-fishing at all?—No.

9865. Oyster-fishing?—Yes, I have been oyster-fishing.

9866. Lately?—Yes, last winter.

9867. Do you find the quantity of oysters decreasing?—In point of fact there are not many here either one way or the other to increase or decrease.

9868. Have you noticed any great change within recent years?—Certainly there has been a great change; there was a large body of oysters at one time, until the country boats took them up.

9869. Do they destroy the fishing?—I consider that they have destroyed it altogether.

9870. Have they carried away the oysters altogether?—Yes, they take them all away.

TORQUAY.

T. Harvey.

12 Oct. 1863.

9871. Might there have been regulations established which would have enabled them to fish, and increase rather than diminish the supply of oysters ?—Yes.

9872. What sort of regulations ?—If they had not been allowed to take away the small oysters.

9873. Did they take away the small as well as the large oysters ?—Yes, the small oysters were what they wanted more than the large ones ; they wanted them to put in their own beds.

9874. Nobody interfered with them in any way ?—No.

9875. Do they come here now ?—No, there are no oysters for them to come for, but they go to Start Bay.

9876. Are there oysters there ?—Yes.

9877. Do you think they will ruin that fishery ?—No, they have not done so hitherto ; I think the quantity continues about the same. There was a large bed found at Dartmouth, and lately it has been much dragged up, but down at Torcross and Start Bay there have been oysters that are the same now as they ever were.

9878. Is the crab-fishing good here ?—No.

9879. Do you follow the mackerel-fishing ?—Sometimes, with the hook-and-line, and sometimes we catch them in the seines also.

9880. Do you get many ?—Sometimes we get a good catch of mackerel in the seines.

9881. Is there a good mackerel-fishing here on the whole ?—Yes, take it on the whole, it is generally a middling season. In fact it is the best of the fishery taking it together with the sprats.

9882. Do you think it would be an advantageous thing to have some regulation by which trawl-fishing could be excluded from the bays, and some regulation also with regard to the oyster beds ?—I think it would be beneficial both to the hook-and-line fishermen, and to the trawlers themselves if the trawlers were excluded from the bays.

9883. Would you desire to see Government officers come down here and regulate your modes of fishing ?—I should like to see it because I think it would be beneficial to us.

9884. You would like to see them come here and exclude the trawl-boats from the bays, and adopt regulations with regard to the oyster beds ?—Yes.

9885. Is there anything else you wish to have done ?—I don't see what they could do to the oyster beds, because there are no oysters for us to catch now. It would make very little difference with regard to the oyster fishery.

9886. Then you only want the Government to interfere with regard to the exclusion of the trawlers from the bays ?—Yes.

9887. Is there any injury done to the young fish except by the trawls ?—Yes. There is another kind of fishing practised here. I mean the shrimp-fishing along the shore. In the spring of the year, in the warm weather, the small fish are in-shore. They are little bits of things about the size of your finger nails. I have been shrimping in a boat along the sands, and I have caught from a quart to half a gallon of these little things, and by the time I have hove the net up they have been all dead.

9888. Did you drag your nets after you in the boats ?—Yes, at that time, but now they have horses to drag them.

9889. Have you seen these horse nets working ?—Yes, I have seen them working, but I have never been ashore with them. They work over the same ground we do in the bays.

9890. Are large quantities of young fish caught in these shrimp nets ?—Yes, they catch them the size of your finger nail. They are fishing there day after day, and they must kill a great number in the course of two or three months.

9891. Is there any mode in which they fish for shrimps without killing these small fish ?—I don't know that there is.

9892. Then to put a stop to it you must stop the shrimping altogether ?—Yes.

9893. Is there a large quantity caught here ?—The quantity is not very great.

9894. Are there many people employed in shrimping ?—No.

9895. How many ?—There are three or four horse trawls worked about Paignton, and there are one or two working from here, that is all.

9896. What is the size of the mesh of one of your small trawl nets ?—For what kind of fishing ?

9897. I mean your boat trawls—the trawl you use in your own boat ?—In the bay ?

9898. Yes.—About 21 or 22 feet beam.

9899. What is the size of your mesh ?—The same size as the other trawls.

9900. The same as the deep-sea trawls ?—Yes.

9901. You don't use a smaller mesh ?—No, it is about the same. But there is very little in the mesh. If you had a mesh about four or five inches it would be about the same, because when you are towing, the mesh draws quite close.

9902. And keeps in the small fish ?—Yes, and keeps in everything.

9903. Whether the mesh is large or small ?—Yes, but if the mesh is large in the back part it will make a difference.

9904. In the back part do you use a smaller mesh ?—Yes.

9905. In the cod of the net ?—No, in the back part from the beam. The back of the net is square. From that down as it tows it is always close, so that the fish that go in must stay.

9906. (*Professor Huxley.*) In your evidence just now you stated that you had not yourself seen much spawn brought up ?—No, but I have seen plenty of small fish brought up.

9907. You are aware that there are a great number of marine animals at the bottom of the sea, and floating on the top, that are not fish ?—Yes.

9908. Are the fishermen in the habit of applying the term "spawn" to a great many of these things ?—I do not know that they are.

9909. What do you think that floating substance is that was mentioned here to-day as spawn ?—I can hardly tell. It might be oyster spawn, because I understand that floats in a body.

9910. We are speaking of fishes in the strict sense of the word, and we should hardly call oysters fishes in that sense. Are you aware of any kind of spawn of the true fish that floats ?—No.

9911. One witness spoke of large quantities of spawn being brought up. What would that be ?—I think it would be cuttle or that blubber stuff. We call them here "Babbicombe squalls."

9912–3. Is it a jelly fish ?—Yes, the medusa.

9914–5. Do you know that what the witness described was the medusa ?—I don't know. I have seen it in large bodies, and I myself judge that it was likely to be that.

9916. Have you ever been herring-fishing here ?—Yes.

9917. You know a full fish when you see it ?—Yes.

9918. What time do full fish appear here ?—They come in roed fish until late in the season, and then they are spent out.

9919. What time do spawn fish come here ?—Sometimes it is later than others.

9920. Is it ever as late as January ?—We have very few herrings here then.

9921. In December ?—Yes, in December.

9922. You have spent fish in December ?—Yes. In January the herrings are pretty well gone. What few are left are all spent fish.

9923. Have you seen herring-fishing elsewhere than in this neighbourhood ?—No.

9924. Do you know the Yarmouth herring ?—I have seen the Yarmouth boats out fishing.

TORQUAY.

T. Harvey.

12 Oct. 1863.

9925. But do you know the Yarmouth herring?—Yes.

9926. Did you ever hear any suggestion that the herrings which are common here are different from those at Yarmouth?—No; but sometimes the herrings run larger than at others. Some nights we catch larger fish than we catch on other nights.

The witness withdrew.

C. Browning.

CHARLES BROWNING called and examined.

9927. (*Mr. Caird.*) Are you a fisherman here?—I have been for a good many years. I live at this fishery.

9928. What is your business now?—Fish buying.

9929. Have you been long acquainted with the fish trade in this quarter?—20 or 22 years.

9930. As a fisherman and a fish buyer?—Yes, I have been hooking for about 12 or 14 years.

9931. When did you cease going to sea yourself as a hooker?—About eight or nine years ago.

9932. As a fish buyer, do you find that the quantity of fish is increasing or diminishing here?—There is a question about their diminishing. Do you mean the sprats, or herrings, or all kinds?

9933. Yes, all kinds?—I see very little difference in them myself; very little difference indeed.

9934. Are more boats engaged in the fishing here than there used to be?—Yes, there are.

9935. Do you think that each boat gets as much as it did formerly, on the average?—Just as much.

9936. Or more?—Some seasons they get more than at others. It varies very much. Some seasons there are plenty of whitings, and at others none at all.

9937. Has there been any marked change in the quality of the fish brought into the market here or brought ashore?—Not in our line.

9938. Do you yourself send many fish to the markets at a distance?—Yes, herrings, sprats, and whitings.

9939. Do you sell your fish principally in Torquay, or do you send them to distant markets?—I send it away. I buy it out of my own boats as well as of other people.

9940. Is there as large a quantity of turbot caught here as there used to be?—There are no turbots here. Brixham is the place for turbots.

9941. Are there as many cod?—I have seen great quantities.

9942. Are they as fine as they used to be?—No. They used to be very good. They don't appear now to be either as many or as good.

9943. Has the quantity of whiting increased or diminished?—There is very little difference, taking a season's average.

9944. Can you tell us the quantity of fish that is sent altogether from here to distant markets?—I cannot tell that. Some weeks we may send 40 tons, and perhaps the next week not one ton. If the sprats come in plentifully, we send away a great deal both of sprats and herrings.

9945. Do you agree with the previous witnesses with regard to the exclusion of trawling from the bays?—I believe that if the trawlers were out of the bays it would be of great benefit to the fishing generally.

9946. Upon what ground do you form that opinion?—In the case of the herring fishery, the boats are disturbed in their drifting. I have been disturbed myself more than once or twice.

9947. But upon what ground do you form the opinion that trawling should be excluded from the bays?—I would take it beyond the headlands. It is not often that they are in except just at spawning time. They don't care about coming except when there are fish.

9948. Which do you think is the spawning time?—I think for certain that the winter season is. We very seldom do catch them in the bays except up to Christmas. Perhaps from about this time up to January.

9949. You do not think it advisable that the trawlers should be allowed to come in here then?—No, this is about the time they should be kept out.

9950. They think themselves that they should be excluded during the warm months and allowed to come in in winter?—That is just the time when they ought to be excluded. I think it would be beneficial to themselves as well as us if they were excluded, as they destroy all the small fish.

9951. Have you seen them taking up their trawls here?—I have not been on board many of them, but I have trawled in a small vessel.

9952. Did you destroy small fish?—Yes, we used to catch small fish. It is impossible to miss catching them.

9953. Is that the reason upon which you ground your opinion, that trawling has been the cause of the diminution in the quantity of fish in the bay?—There is a diminution, and I think it has been occasioned by the trawl-fishing.

9954. As a line fisherman in deep water, do you find that trawling does you any damage?—I do not think that it does us any damage whatever.

9955. Do you think there are as many fish in the deep sea as there used to be?—Yes, exactly the same.

9956. You don't think that the ground has been at all fished out?—No.

9957. Have you observed the trawl-boats in the deep sea?—Yes, daily.

9958. Do you find them fishing over the same ground repeatedly?—Yes, they are trawling right on our ground and catching our anchors at times.

9959. Trawling always over the same ground?—Yes.

9960. For years in succession?—Yes, just the same.

9961. Do they get as many fish as they did?—It appears that they do not get as much trawled fish as they used to do.

9962. Are you aware that the number of trawl fishermen has greatly increased?—Yes, perhaps that may be the cause of it.

9963. Have you ever fished for oysters in this bay?—Yes, a great many years ago.

9964. You have not done so lately?—No.

9965. Do you buy any oysters?—No, there are none caught here in any quantity to sell.

9966. Are there many crabs caught in this bay?—Only very few.

9967. Lobsters?—Very few.

9968. That is not a fishing that is of much importance here?—It is not of great importance. The little fishing here is principally hooking, netting, and seining. That is all in Torquay. There is no trawling.

9969. Is the mackerel-fishing of importance here?—Yes, the seining in the summer seasons.

9970. Does the quantity continue the same?—Just the same. In some seasons it is better than in others.

9971. No particular mode of fishing has disturbed that fishing?—No.

9972. Nor the herring-fishing?—No.

9973. Nor the sprat-fishing?—No; sometimes the trawlers have been here at the time our small nets have been at work, and I think they have been disturbed.

9974. That chiefly applies to flat-fish?—Yes, and to spawn of other sorts; the hakes come after the small fish, and the trawlers come after the hakes. They will have them if they can.

The witness withdrew.

FRANCIS STANSFIELD called and examined.

9975. (*Mr. Caird.*) Are you a fisherman here?—I have been in the habit of fishing in the bay for the last 20 years. I have been dab fishing here.

9976. How do you fish for dab?—With a hook-and-line.

9977. Has the number of boats engaged in that fishery increased or diminished within the last 20 years?—It has increased.

9978. Has the quantity of fish they can bring on shore in a day's fishing diminished or increased?—It has diminished a good deal. I have been out and I have made 12*s.* a day catching dabs with the hook-and-line, and now I may go 12 days before I catch 12*s.* worth.

9979. When did you notice that diminution begin?—For several years past.

9980. Has it been going on gradually decreasing?—Yes.

9981. Is it becoming less and less every year?—Yes.

9982. What particular kinds of fish does that apply to?—Dabs.

9983. Only dabs?—We catch very little else in this bay.

9984. What in your opinion is the cause of that decrease?—All the small fish are destroyed.

9985. Who destroys them?—The trawlers and the shrimp dredgers on this coast.

9986. Have you seen the trawlers destroy many of them?—Yes, I have seen hampers and hampers chucked overboard, and I have seen caught on the shore turbots and brill no bigger than my thumb nail.

9987. Is it long since they began their practice of shrimping?—About six or seven years ago.

9988. Is it long since the trawl-vessels began to trawl in the bay?—Ever since I can recollect they have been trawling.

9989. But it is only of late years that you have noticed the diminution in the quantity of fish?—Yes.

9990. Has the number of vessels trawling in the bay increased?—Yes.

9991. Have you practised line-fishing at all?—Yes, every year.

9992. In the deep sea?—Very little in the deep water; mostly in the bay.

9993. I am speaking of the deep water?—Very little there.

9994. Then you cannot say whether the quantity of fish caught in the deep sea is increasing or diminishing?—I think the whitings are about the same. I don't see much difference in them; but the flat-fish in the bay have diminished a great deal.

9995. (*Professor Huxley.*) Do you go herring-fishing at all?—I have been.

9996. You heard what the previous witnesses stated as to the time of spawning here. Do you agree with them?—Yes.

9997. Do you find full fish in January?—No, they are all spent at that time.

9998. After that they go away?—Yes.

9999. Do you ever get herrings here as late as February?—No, very seldom. We may catch some, but they are all spent out.

10,000. What do you say is the chief spawning time here for herrings?—November and December. The latter end of November and the beginning and middle of December.

10,001. Do you think that the trawls take up much spawn?—No doubt when the herrings come into the bay they spawn here.

10,002. In what depth of water do they spawn do you think?—We catch them at times in 3 fathoms of water, and sometimes in 6 or 9 fathoms.

10,003. Do you ever catch them when they are spawning; do you find your nets covered with spawn?—Yes, and our hampers are all choke full of spawn.

10,004. Do you find that they keep near the bottom, then?—Yes, we always notice them low down then, and if they are we haul them up.

10,005. Do you find when they are spawning that they keep close to the ground?—We consider that they do.

10,006. How long do you keep your head lines?—The prior lines?

10,007. How long do you have them when the fish are spawning?—About $2\frac{1}{2}$ fathoms.

10,008. Your net is about 3 fathoms deep?—Yes.

10,009. So that the bottom of the net would be nearly on the ground?—Yes; sometimes we lower the net on the ground.

10,010. Have you found that to be the case when the fish are full?—Yes.

10,011. So that they are all right inside the bay?—Yes; sometimes they are right choke on shore. I have caught them high and dry right in shore, sometimes.

10,012. Where do you find them hugging the ground?—In about 6 fathoms of water.

10,013. Is that usual at the end of November or beginning of December?—Yes.

10,014. You say that December is the great spawning month here?—Yes.

10,015. Have you ever noticed the young herring making their appearance?—Yes.

10,016. At what time?—At the beginning of February. There were a great many caught here last year.

10,017. How were they caught?—By the seine.

10,018. A regular shore seine with a pocket?—No; the same we use for catching smelts.

10,019. What sort of net is that?—It is a small net, 60 or 70 fathoms long.

10,020. How deep is it at the wings?—About a couple of fathoms. We never shoot it unless it is low water.

10,021. How deep is it at the bunt?—About three fathoms.

10,022. You say there is no pocket?—No.

10,023. Is it leaded?—Yes.

10,024. Do you sweep it from the shore the same as an ordinary seine net?—Yes, I never saw so many caught as were caught last February. We caught 100 hampers in fishing for smelts.

10,025. What did you do with the young herrings?—We sold them for sprats.

10,026-7. Did the people like them as well as sprats?—Not quite. There is a great deal of difference in the taste, there is just the same difference as there is in eating a beefsteak and in eating a piece of naked beef.

10,028. At what time are the sprats full?—In November and December they are full of milt and roe. I have seen them full of spawn; as full as they could hold.

10,029. Where do you consider they spawn?—I consider that they come in-shore to spawn, but no doubt there are a great number that spawn out in deep water.

10,030. Then according to that you cannot have the young herring and the sprat spawning together?—It is very seldom that we see the young herrings among the sprats. We can discern them in a minute. The head of the sprat is quite different from the head of the young herring.

10,031. Do you ever have any summer herrings here?—We had some 20 years ago, but it is very seldom that they come now.

10,032. Do you think that the herrings go on growing from the early part of the year to the end of the year, and that then they are grown up?—I consider that that is so. A herring is like the mackerel, a very fast growing fish.

10,033. Then do you think they are commonly one year fish?—The small herrings we caught last year are what we call harvest herrings.

10,034. Why do you call them harvest herrings?—Because we catch them in the summer.

10,035. Are they like this (*holding up a herring*)?—Yes, sometimes.

10,036. Is it what you call a "matey"?—It is very fat inside.

10,037. They are about eight or nine inches long?—Yes.

10,038. We call that a "matey"; you call them harvest herrings because you catch them in the autumn?—Yes.

TORQUAY.

F. Stansfield.

12 Oct. 1863.

10,039. Do you think they grow to be full herrings in the winter?—I think it is very likely. Sometimes we catch small mackerel, and you can see them grow every week.

10,040. Do you catch small herrings now?—Yes.

10,041. What with?—With a hook-and-line.

10,042. What do you call them?—"Joeys."

10,043. Do you know the reason of that name?—No; it is only a nickname we give them.

10,044. Are the majority of the mackerel you catch of that size?—We catch them for bait for whitings now.

10,045. Do you find that they get bigger and bigger as the year wears on?—Yes, we can see them getting bigger and bigger every week.

10,046. When are they of full size?—About next May.

10,047. Then do you think the mackerel keep off this coast all the year round?—Yes; in the cold weather they get into deep water, but in the warm weather they come into shallow water. After Christmas we catch them with a ground-line.

10,048. Do you catch the big mackerel on your ground-lines?—Yes, when we are catching whiting. I have caught as many as a dozen in a day.

10,049. Are they full fish?—The roes are beginning to get in them.

10,050. The little mackerel have no roe in them?—No; the mackerel begin to spawn about February or March. They are getting full fish then.

10,051. They will not spawn until May, will they?—We don't get any mackerel till the latter part of May. We seldom see any roe in them, but this year we have.

10,052. Do you think the mackerel spawn before they are in a condition to be caught?—Yes.

10,053. Do you think the mackerel you catch are spawn fish?—Yes; in February and March they are full of spawn. They catch them in nets in February and March, and then there is spawn in them, but there is seldom any in May. This season I saw that was so.

10,054. Do the mackerel further on in the year contain any spawn?—No.

10,055. Are the large fish you catch in the summer fish that have spawned?—Yes.

10,056. And they are getting fat again?—Yes; I have seen them spawn later in the season.

10,057. Do you think the mackerel grows to its full size in the course of a year?—Yes. I think the mackerel is as fast a growing fish as anything.

10,058. What do the mackerel eat?—Mostly small sprats.

10,059. Do you find sprats in their stomachs?—Sometimes I have caught them with little sprats a few inches long all alive in them. They are sometimes after whitebait, smaller than that.

10,060. Whitebait?—Yes; but this time of the year the sprats are getting more in bodies, and they are following them up.

10,061. Do you get regular whitebait here?—I think that it is whitebait.

10,062. Where do you get it; at the mouth of the Dart?—No, in deep water. I have seen the stuff that the mackerel come after, and it is just like whitebait.

10,063. Do you not think that it is young herrings or sprats?—It is more like sprats than herrings. They may be young sprats; I have no doubt but what they are. But some of it is as small as whitebait, and you could hardly tell the difference.

10,064. Have you ever seen the horse trawls working?—No, but I have heard of them.

10,065. Do you think that the seine netting and the sprat-netting do harm to the fish in the bay?—No; I have been sprat-fishing, and I have not caught a ha'porth of small fish.

10,066. Do you think the sprats keep to themselves?—Yes, all in a volume. They are like the colour of this desk in the water.

10,067. Do they look red in the water?—Yes, as red as that desk. They make the water look as though it was red water.

10,068. What do you think the sprats feed upon?—I cannot say.

10,069. Have you ever examined them?—No; I cannot make out what they feed upon.

10,070. (*Mr. Caird.*) Do you ever get any salmon in your nets here?—Very seldom.

10,071. You get no great quantity?—No.

10,072. Do you get any salmon trout?—No. There has been about a dozen caught this summer, and they are the most we have ever caught as far as I have known.

10,073. Are there any smelts caught here?—Yes, but they are different smelts from the London smelts.

10,074. What is the difference?—They don't run so large.

10,075. Are they caught in any quantity here?—Sometimes we catch a dozen bushels right in the harbour.

10,076. Is that in any particular season of the year?—Yes, in February and March.

10,077. Do they come pretty regularly?—They come in some seasons more than in others.

10,078. Are they sold in the town here?—I have seen them sold for $1\frac{1}{2}d.$ a quart, and $9d.$ a dozen quarts.

10,079. How many are caught in a boat?—Sometimes more and sometimes less. If it is nice and calm and smooth water we catch a good many at times, but there is only one little seine that practises that work.

10,080. (*Professor Huxley.*) Have you any idea what the herrings feed upon?—No.

The witness withdrew.

The inquiry was then adjourned until the 17th of October, at Ramsgate.

Ramsgate, Kent, Saturday, 17th October 1863.

PRESENT:

JAMES CAIRD, Esq. M.P. (Chairman). | Professor HUXLEY, F.R.S.

RAMSGATE.

J. Gravells.

17 Oct. 1863.

JOSEPH GRAVELLS called and examined.

10,081. (*Mr. Caird.*) Have you been long engaged in the fishery here?—Yes, for many years.

10,082. What mode of fishing is chiefly practised at this port?—Trawling.

10,083. Is there any line-fishing?—Very little. There are a few hand-lines used outside the pier heads, but nothing more.

10,084. Has your experience extended over many years?—Yes, I have been fishing for 50 years.

10,085. Can you give us any account of the progress of the trawl-fishing during that period?—As regards the progress of it, many people have profited by it, and got many a smack out of it, and many a poor man has been enabled to save money out of it, and to buy a new smack.

10,086. Do you remember what was the number of vessels engaged in the trawl-fishing when you first became a fisherman here?—There were not more than three or four belonging to the place, to the best of my recollection.

10,087. Were they about the same size as they are at present, or were they smaller?—No, they were

quite small; there were two or three small smacks and luggers.

10,088. What was the size of the trawl at that time? What was the length of the beam?—The length of the beam at that time might be 28 or 30 feet.

10,089. How many men were there in each boat?—Four generally, and sometimes five.

10,090. Can you call to mind the quantity of fish you would take in an average catch at that time?—I cannot say what it would be upon the average; sometimes we caught more, and sometimes less.

10,091. Can you tell us about what quantity it would be in a fair day's fishing?—As regards the weight?

10,092. Yes, either the weight or the number of baskets full, whichever mode is most convenient for you to reckon by?—Perhaps 2 cwt. in a morning; perhaps there would be 2 or 3 cwt. every other morning, and so on.

10,093. What was the kind of fish principally caught at that time?—All sorts of ground-fish, soles, turbots, plaice, gurnets, and all sorts of ground-fish.

10,094. Any cod?—Yes, now and then.

10,095. Any whiting?—Yes.

10,096. You do not call cod and whiting ground-fish, do you?—Yes, they are ground-fish, although they are caught by the hook.

10,097. Were there any haddocks?—Sometimes an abundance, but not lately. There have not been a great many haddocks on this coast lately.

10,098. How many vessels are engaged here now in the trawl fishing?—There are about 50 here now.

10,099. What size are they compared with what they were at the time to which you have just referred?—They are now from 45 to 55 tons.

10,100. You did not tell us the tonnage of them in former times. What was the tonnage of the vessels formerly?—About 28 or 30 tons.

10,101. What is the average length of the trawl beam now?—Some have them 32 feet, some 34.

10,102. Not more than that?—I believe that is the extent—34 or 35 feet.

10,103. Are you at present engaged in the trawl-fishing?—No, I am engaged in netting the trawls for the trawlers now.

10,104. Are there no trawls here the beams of which are longer than 34 feet?—Yes, I beg pardon. I think I misunderstood you. The beam is from 38 to 40 feet or so. I will not speak to a foot or two.

10,105. I understood you to say that in former times it was from 28 to 30 feet long?—Yes.

10,106. And now it is from 38 to 40 feet?—Yes, and some are more than that.

10,107. How many men are there in each boat?—Five, altogether.

10,108. And what may be the average catch of fish now?—I cannot say. There is still an abundance in summer time, but a great portion of it is good for nothing when it is got. Where we are in the habit of working now there are hundreds of bushels caught that are not fit for human food.

10,109. Where is that?—Between the North Foreland and the Kentish Knock.

10,110. What do you consider a fair day's fishing compared with what it was at the previous time to which you refer?—I can hardly say. I can hardly draw a line. The vessels that belong here now do not stay all the summer through.

10,111–2. You mentioned 2 cwt. being brought ashore in the morning as a fair average day's fishing in former times; what quantity is brought ashore now?—About two or three or four baskets. It all depends on the wind and the weather. Perhaps two or three baskets may be brought ashore in the course of a morning weighing 80 lbs. or more.

10,113. Two or three baskets of 80 lbs. each?—Yes.

10,114. That is a smaller weight than you mentioned as having been caught by the boats in former times?—Sometimes they get more and sometimes less.

10,115. But is it the case that the larger vessels, with a larger and longer beam, and a larger net, and larger every way, make a smaller catch than the boats did in former times?—No, not the larger vessels; they are supposed to catch more.

10,116. I am now asking you about the larger vessels to which you referred?—They are supposed to catch more fish than the smaller vessels.

10,117. Can you speak of your own knowledge as to what they catch?—Not exactly.

10,118. You stated that a large proportion was not marketable fish; what kind of fish is it?—They are small plaice, not half so big as your hand. They are very small indeed.

10,119. Is that unusual; has there ever been a time when these small fish were not caught in large quantities here?—Small fish are generally caught every summer.

10,120. More so this summer than in former times?—Yes, I think there has been more taken this summer than there has been for many years.

10,121. Are they caught in-shore?—Between the North Foreland light and the Kentish Knock upwards.

10,122. Is there much fishing done by hand?—A great deal.

10,123. Do you think that trawling within the headlands has been injurious to the fishing?—Yes, that is our opinion. We think that the fish have not time allowed them to grow up and go into deep water before they are taken.

10,124. Is there much trawling practised off this coast within the headlands?—Yes, a good deal of it.

10,125. Is a large proportion of the fish caught in this way unmarketable?—Yes.

10,126. What proportion of the fish caught by the trawls within the headlands is unmarketable?—I cannot say. It is left about the decks and hove overboard by the shovel.

10,127. Have you yourself seen that done?—Yes, many a time. It would fetch nothing at all if it were brought ashore.

10,128. Has the proportion of small fish been increasing in this place?—Well, I think it has increased this summer. I don't think there ever was more taken than has been taken this summer.

10,129. Is the trawl-fishing chiefly practised near the coast, or in deep water?—In the summer time they fish near the coast.

10,130. Although they catch such a large proportion of unmarketable fish?—Yes.

10,131. Is that a profitable business for the fishermen to follow?—I cannot say that it is. In the summer time it is no good fishing when they get out into deep water.

10,132. Do you know the usual price of fish here?—No, it varies from day to day according to the quantity caught. Sometimes it is cheaper and sometimes dearer.

10,133. Are you yourself a salesman or a buyer of fish?—No, neither.

10,134. Do the Dutch or French boats come on this coast to fish?—A great number of French boats come.

10,135. Do they come near the shore?—Yes, and fish along with the English boats.

10,136. Do they fish within the bays?—Yes.

10,137. Have you seen them fishing within the bays?—Yes, I have been fishing with them before I left the fishery.

10,138. Do you speak of trawl-boats?—Yes.

10,139. Do you know what distance from the shore they have been in the habit of fishing?—Close upon the shore sometimes; in Rye Bay in particular, and in any other bay-water as well.

10,140. There are some particularly good fishing grounds off this coast, are there not?—Yes, excellent.

10,141. Is there any particular name for any of them to which you can refer us?—Yes, such as the Banks.

10,142. Which Banks?—The Falls Bank and the New Ground Bank.

RAMSGATE.

J Gravells.

17 Oct. 1863.

10,143. How far off the coast are they?—About a dozen miles.

10,144. You would call that deep-sea trawling?—Yes, there is deep water there, but they strike the Banks for the turbots.

10,145. Are these Banks outside the heads?—Yes, half way between this and Calais.

10,146. Have you fished on these Banks continuously?—Yes.

10,147. For a continuous number of years?—Yes, before I left off.

10,148. Do these Banks yield as large a quantity of fish to the fishermen as they used to do?—I do not think that the fish on the Banks are as plentiful.

10,149. What description of fish that used to be productive and prolific has fallen off?—The turbots in particular have fallen off from these banks.

10,150. They have fallen off in quantity?—Yes, I think they have.

10,151. Can you speak with accuracy about it. Have you lately been on these Banks yourself?—I have not been there for two or three years.

10,152. Do you remember a time when much larger quantities of fish were got on these Banks than are got now?—Yes, some years ago we were catching great quantities of fish on these Banks, but of late years the fish there have not been so plentiful.

10,153. Does that relate to all the Banks commonly fished off this coast?—Yes, I think it does.

10,154. What do you think is the cause of that?—We don't know what is the cause without it is owing to the lines. Some say it is owing to the vessels going so near these Banks with their lines.

10,155. What lines?—Fishing with long-lines and hand-lines.

10,156. Do you think that the quantity of fish taken by the long-lines and the hand-lines has diminished the quantity of fish taken by the trawlers?—Yes, some people think so.

10,157. Do you practise the herring-fishing here at all?—No.

10,158. Have you ever fouled the herring nets when trawling?—Yes, now and then when I had the misfortune to get hold of them.

10,159. Have you had to pay for the damage you have done in that way?—No, and I have never heard of any person who did.

10,160. Cannot the herring fishermen identify you afterwards?—Yes, they can.

10,161. Then, do they not think it worth their while?—We try all we can not to do any damage. They hinder us from our night's work as well as we hinder them, and we are glad to get clear of them if possible without doing any mischief.

10,162. Does it often happen that you do mischief?—We cannot help it if we come across them.

10,163. Do they not carry lights?—Yes, sometimes they do, but you are alongside of them before you know it.

10,164. (*Professor Huxley.*) Do you say that there are many long-line fishermen in this port?—No.

10,165. How many are there do you suppose?—I don't know that there is any one who goes out with long-lines off this coast.

10,166. Then where do the long-line fishermen of whom you speak come from?—They come from the river, from Greenwich, and off that way.

10,167. What do you consider your principal trawling grounds off this coast?—There is a spot of ground here we call the Foreland; that is the nicest trawling ground we have, barring the Banks we were talking about just now.

10,168. You trawl close off the Foreland?—Yes, between the North Foreland and the Galloper.

10,169. How far is that from the shore?—The Galloper is 28 miles from the North Foreland.

10,170. Then is it all soft ground between the North Foreland and the Galloper?—There is soft ground.

10,171. Not too hard to trawl upon?—No.

10,172. How wide is that ground which you say is 28 miles off the shore?—28 miles is the length.

10,173. How wide is it?—You can trawl right across to France.

10,174. You can go on trawling all over that space?—Yes.

10,175. Is that where the trawl-vessels from this place principally go?—No, they go principally into the North Sea.

10,176. What part of the North Sea?—Off Lowestoft; about 30 miles off Lowestoft.

10,177. Then do they leave this place and go down to trawl off Lowestoft?—Yes, for a month or six weeks.

10,178. Do they return then?—Yes.

10,179. Where do they send their fish to?—To London.

10,180. It does not come through Ramsgate?—No, only now and then.

10,181. Is it sent up by despatch vessels to London?—No, they simply get vessels to take it by way of Lowestoft to London.

10,182. The fish caught off there goes by way of Lowestoft?—Yes.

10,183. Is there any return of the quantity of fish caught here that will give us an exact idea as to the amount the trawl fishermen get?—Not in the summer time.

10,184. Is it only in the summer time that they go into the North Sea?—They go all the winter as well.

10,185. But they come here after five or six weeks?—They come here in the winter time. It all depends on the amount of wind; if it is southerly they go to Lowestoft with their fish.

10,186. How often do they come with their fish?—If they are out three or four days they bring in one another's fish.

10,187. What becomes of the fish brought in here?—It goes to London and to places round here.

10,188. I think you said that there are very few haddock caught here at present?—Very few indeed.

10,189. Has the quantity of haddock fallen off of late years?—We have not had a quantity of haddock for several years.

10,190. Within your recollection was there a time when you caught plenty of haddock?—Yes, both small and great.

10,191. How long ago is that?—Nine or ten years.

10,192. Did you catch them with the trawl?—Yes.

10,193. For the last six or seven years there has been a falling off?—Yes, there has been in haddock.

10,194. What do you think is the reason of that?—I cannot say.

10,195. You stated that the fishermen here were not particular to a foot or two as to the length of the beam of their trawl?—No.

10,196. What is the extreme length of the biggest trawl beam they have?—The largest?

10,197. Yes?—Some may have them 40 feet long.

10,198. What is the largest?—I cannot say. They try to outdo one another. It is who can have the longest.

10,199. Are you aware that a trawl beam 40 feet long is illegal?—No, I am not aware of that.

10,200. Do you suppose that any of the fishermen here know that?—I don't know whether they do or not.

10,201. Is there any person here who has authority to inquire into these matters?—Yes, there are several; plenty.

10,202. Does anybody trouble the people here?—No.

10,203. Does anybody examine the length of your beam?—No.

10,204. What is the size of the mesh of the trawl net here from knot to knot?—There are different sizes.

10,205. You make the nets, do you not?—Yes.

10,206. Do you fit them on?—No.

10,207. What is the size of the mesh?—What do you call the mesh?

10,208. The length from knot to knot?—3 inches, I should say.

10,209. Three inches from knot to knot?—Yes.

10,210. Do you mean to say that the mesh is 12 inches round ?—No.

10,211. The measurement I speak of is from this knot (*showing a net*) to that knot. Now what is that? —About an inch in some parts of the net.

10,212. What is the biggest mesh you make in your nets ?—I should say $2\frac{1}{2}$ or $2\frac{3}{4}$.

10,213. Two and three-quarter inches ?—Yes.

10,214. From knot to knot ?—Yes.

10,215. What is the smallest ?—That is as small as any we have got.

10,216. How long is that? What do you gauge your nets by ? You say you make nets ?—Only by my fingers.

10,217. You are a maker of nets ; are you aware of any law regulating the size of the mesh ?—No.

10,218. Did you ever hear of this : "Trawls shall "be made with nets, the meshes of which shall be at "least $1\frac{3}{4}$ inch square, from knot to knot, along the "line" ?—No.

10,219. Then you did not know that it was part of the law of the country ?—No.

10,220. Does anybody ever examine your nets ?—No. When they get the net we have nothing more to do with it—I mean we who make them.

10,221. Did you ever hear that any net you had made or supplied had been seized ?—No.

10,222. Do you make herring nets as well as others ? —No.

10,223. Have you used herring nets ?—No.

10,224. Have you yourself been a herring fisherman ?—No, never.

10,225. Do you make the trawl heads as well as the trawl nets ?—No.

10,226. Do you fit the trawl heads ?—No, that is blacksmith's work.

10,227. You have nothing to do with the trawl beams either ?—I have nothing to do with anything but the trawl net.

10,228. I understood you to say that you have been trawling for many years yourself ?—Yes.

10,229. You said that you were often in the habit of getting among the herring men, or that the herring men get among you ?—Yes.

10,230. Do you ever feel under any obligation to get out of their way ?—Yes, it is our interest to do so.

10,231. Supposing it had not been your interest, did you know that you were bound to get out of the way ?—We should do so if we could, but sometimes we are unable to do so.

10,232. Do you know that you could be punished for not getting out of the way ?—No.

10,233. Did you ever hear of this : "Trawl-boats "shall always keep at a distance of three miles from "all boats fishing for herrings or mackerel with a "drift-net." Did anybody ever endeavour to enforce that regulation ?—I think not.

10,234. Did you ever hear of this law : "Trawl-"fishing is forbidden in all places where there are "boats engaged in herring or mackerel drift-net fish-"ing." Did you ever hear of that ?—Yes, I have heard of it ; but I never knew the law put in force.

10,235. Is there anybody here about this part or at this port whose business it is to enforce laws of this kind ?—I don't know that there is.

10,236. Is there any cutter ?—There are two cutters.

10,237. Do they meddle with the fishermen ?—I believe not.

10,238. Did you ever know them do so in your experience ?—No.

10,239. I understood you to state just now that there has been some falling off in the catch of fish—that there is not so much fish caught now as there used to be, do you mean that ?—No, I cannot say that. I think there is more fish caught sometimes ; I don't see any falling off in it altogether.

10,240. I think you said that in olden times, when the boats were small and the beams of the trawls were not more than 28 feet long, they not uncommonly brought in two or three cwt. of fish in a morning. Did I understand you to say that ?—Yes ; but there are a great many more trawlers now.

10,241. At the present time you say they do not commonly bring in more than two or three baskets of 80 lbs. each, and yet the boats are much larger and the beams much larger. Surely that looks as if there was a falling off ?—A great deal of what is brought in now is not fit for human food. They catch it when it is not fit to eat.

10,242. (*Mr. Caird.*) You have said once or twice that a great number of small immature fish not fit for human food is caught ; does that apply to the fish taken within the headlands ?—Yes.

10,243. Do you think it desirable that any regulation should be adopted to prevent trawling within the headlands ?—Of course it would be a great advantage, I think.

10,244. Do you think it would be a benefit to the fishermen in general ?—Yes.

10,245. Why do you think so ?—Because the breeding of the fish is destroyed in shoal water by the seines.

10,246. Would you exclude the trawl-fishers from the bays altogether during the whole season or only part of the season ?—Only part of the season ; about four months in the year.

10,247. What four months in the year ?—May, June, July, and August.

10,248. Why do you specify these months ?—Because we consider that the fish are breeding about that time ; that they are good for nothing if they are got ; and that if they were not caught then they would have time to go into deep water.

10,249. At a later season in the year do you find that there are not as many small fish caught in the bay ?—There are not as many small fish caught then as are caught in the summer.

10,253. Are they large enough to be marketable then ?—Yes.

10,252. Then you think it would not be so destructive to the fish in the bays at a later season of the year ?—No, the fish would have had time to draw off into deep water.

10,253. Are the bays fished by the trawlers at a later period of the year ?—Yes.

10,254. Do they catch large fish then ?—Yes.

10,255. You say that a large proportion of the vessels which hail from this port fish in the North Sea. What is the proportion that fish here, and the proportion that fish in the North Sea ? Have you no trawl-vessels off here in the winter time ?—Now and then two or three stop here.

10,255*a*. A large proportion leave the shore and go to the North Sea in the winter time ?—Yes.

10,256. Are there any fish caught off this shore in the winter time ?—Not as much as would pay the fishermen.

10,257. Has that been the case long ?—Oh, yes, for many years.

10,258. It has not been a recent decline in the fishing off this coast ?—No.

The witness withdrew.

WILLIAM CLAPP called and examined.

W. Clapp.

10,259. (*Mr. Caird.*) I understand that you are an owner of trawl-vessels here ?—Yes.

10,260. Are you yourself a fisherman ?—Yes.

10,261. Are you at present engaged in fishing ?—Yes.

10,262. Have you had a long experience in the fishing here ?—About 28 years.

10,263. Has your experience been altogether confined to trawl-fishing ?—Yes.

10,264. Can you tell us with accuracy the number of vessels engaged in the business when you first began ?—There were about 15 or 16 belonging to Ramsgate, but a great many more came from other places from the westward.

RAMSGATE.

W. Clapp.

17 Oct. 1863.

10,265. Did large numbers come from the westward at that time ?—Yes, in the winter season.

10,266. Do they still continue to come here ?—No.

10,267. Where do they go now ?—I believe they stop at home, they find it as well to stop at home.

10,268. What number of vessels do you suppose are engaged in trawl-fishing now ?—55.

10,269. Do you agree with the former witness that they are a larger class of vessels altogether and that they carry larger nets than formerly ?—Yes.

10,270. Has the trawling here in your experience been as profitable a matter of business as formerly ?—It has been profitable during the last two years ; it has been more profitable than it was before.

10,271. Are the fishermen the owners of vessels engaged in trawling ?—Yes, mostly.

10,272. Have those who sail in them mostly a share ?—No.

10,273. Do the owners of the vessels fish in them themselves ?—Yes, with the exception of one or two.

10,274. Can you tell us whether on the average the quantity of fish caught in former times was less or greater than it is now ?—It was less in former times, when I first went to it.

10,275. Do you think there is a larger quantity caught by each vessel now than there was before ?—Yes, a great deal larger.

10,276. What would be the average take 28 years ago, or say 20 years ago ?—The take is quite one third more now than it was then.

10,277. You think that each boat can bring one-third more ashore now than it could then ?—Yes, quite as much as that.

10,278. And you have all this increased number of boats at the same time ?—Yes.

10,279. Then there is a larger quantity of fish brought to this port than there used to be ?—They catch a much larger quantity, but it is not brought here. The vessels are only here for a few months in the year, they go to the North Sea, and they take their fish to the nearest port from which it can be sent to market.

10,280. Do you suppose that there is a much larger quantity of fish taken to the general markets of the country by the boats than was the case formerly ?—A much larger quantity.

10,281. Can you give us any estimate of the quantity ?—With regard to the soles, where they caught one formerly they catch three now.

10,282. Does that increase apply to all kinds of fish, or only to some particular kinds ?—To all caught in the winter season, to all the catch of offal fish, flat-fish, and turbot.

10,283. The previous witness said there was a great falling off in the catch of turbots ?—I don't agree with him in that opinion, I believe there are quite as many caught now as formerly ; but the smacks do not follow them as much as in former times.

10,284. Is there any great quantity of whiting, haddock, and cod caught ?—We don't catch a cod in the course of two or three weeks ; it is very seldom we catch cod.

10,285. There is not a large proportion of cod caught in the trawl nets ?—No, it is mostly plaice and white fish, and a few herrings at times.

10,286. What would you think a good average haul by a trawler ?—We cannot average it.

10,287. I don't want the best or the worst catch, but what would be an ordinary average haul ?—About 15 or 16 baskets, taking the average of the good and the bad.

10,288. What weight of fish does each basket contain ?—About half a cwt. I take the rough fish with the smooth, the best fish with the worst, altogether.

10,289. What different kinds of fish would these 15 baskets comprise, and in what proportion ?—They consist principally of soles, plaice, and other fish.

10,290. How many baskets of soles would there be ?—Perhaps two or three baskets.

10,291–3. How many of the 15 would be plaice?—10.

10,294. What would the others consist of ?—Whitings and turbots, and brill, taking the average.

10,295. Is there a very small proportion of haddocks ?—Yes, a very small proportion in the part where we go trawling.

10,296. Is any large proportion of these 15 baskets small and immature fish unfit for the market ?—No, not in the North Sea.

10,297. Do you ever fish within the headlands here ?—Yes, in the summer time.

10,298. Do you find that you catch a large proportion of small fish ?—Yes, if we get within a certain depth of water.

10,299. What depth ?—10 fathoms.

10,300. Within 10 fathoms ?—Yes, in the bay.

10,301. What proportion of your catch will be small fish then ?—We get a quantity of small plaice, whiting, and soles.

10,302. Will there be several basketfuls ?—Yes.

10,303. What do you do with them ?—We seldom go there, we keep without that small fish ; the English fishermen do not care to catch it, but the Frenchmen come there by scores every summer.

10,304. Do you not continue to fish when you find you are getting a large proportion of small fish ?—No, we keep further out, in deep water.

10,305. Is it common for your trawl-boats as soon as you discover you are taking small fish to change your ground ?—Yes, we go further out.

10,306. Are there no trawlers that practise fishing there ?—No large vessels ; there are small boats that do.

10,307. With a much smaller trawl ?—There are boats that are hauled up on the beach at this place.

10,308. When you are fishing in the deep sea, do you catch many of these small fish ?—No, we catch very few, seldom any. In the summer time the French from all parts of France come within half or a quarter of a mile of this coast to fish.

10,309. Do they come in great numbers ? Are there many boats ?—Yes, 20 or 30 sail in a day.

10,310. Are their boats the same size as your own ?—They are differently rigged. They are lugger rigged, while ours are cutter rigged.

10,311. Do they carry nets about the same size as yours ?—Yes.

10,312. Do they catch a large quantity of small fish?—Yes, a great quantity.

10,313. Do they take them to the French market ?—Yes, I think so, but we don't take ours to market.

10,314. They don't throw them into the sea again ?—No.

10,315. They do not object to fishing in shallow water, then ?—No, if they can get any quantity of fish.

10,316. Then do you think that a greater degree of injury is done by the French fishermen than by your fishermen ?—Yes.

10,317. Do you think it injurious to the fishing that these small fish should be caught ?—Yes.

10,318. Would you like to see some rule established by which this kind of fishing in the bays could be put a stop to ?—Yes, because I think the fish go there to spawn. I have been fishing for 10 or 15 summers about these bays. I have found a great quantity of small fish at times. These Frenchmen come and catch it up, and as long as they can get a quantity of fish they do not mind whether it is small fish or large.

10,319. It is only in the summer season that these fish are caught ?—That is all.

10,320. Then does your objection to fishing in the bays with the trawl net only apply to the summer months ?—There are very few fish in the bays except in the summer time.

10,321. Do you think that if any regulation were established it should apply to the whole year, or only to certain months in the year ?—I don't think it would hurt if it applied to the whole year.

10,322. You are of opinion that trawling in the bays should be put a stop to entirely ?—Yes.

10,323. What would be a proper distance to keep

the trawlers outside the shore?—I would keep them not within 10 fathoms of water.

10,324. Without regarding the headlands at all?—Yes.

10,325. You would not draw a line from headland to headland, and say there shall be no fishing within this line?—No.

10,326. You would go by the depth of water?—Yes.

10,327. Would it not be difficult to enforce a regulation that was not defined by a line?—No, there are plenty of fish that come within the headlands. We get a great quantity of large fish in the deep water now that are within the headlands.

10,328. Would the 10 fathom depth be considerably within a line drawn from headland to headland?—Yes.

10,329. Why do you particularly fix 10 fathoms?—I don't know what it ought to be within a fathom or two. That is only my judgment.

10,330. Have you had any experience that leads you to say that when you get outside 10 fathoms you cease to catch small fish?—Yes, outside 10 fathoms we don't get many small fish.

10,331. Then you think that if the restriction were limited to 10 fathoms that would be a beneficial regulation?—Yes, with regard to the fishing in the bays.

10,332. Do you yourself fish much on any particular grounds on this coast which are favourite fishing grounds?—Yes, in this very bay I am speaking of.

10,333. I do not mean in a bay, but outside the bays in deep water?—Yes.

10,334. Can you give us the name of any particular ground?—Rye Bay.

10,335. How far is that from the shore?—The fishing ground begins from the shore, and it goes off for three or four miles.

10,336. I wish to direct your attention to deep-sea trawling, not in-shore trawling. Is there any fishing ground here that is celebrated for yielding a large quantity of fish?—Yes, in the North Sea.

10,337. Not off this shore?—Yes, off this shore in the summer season.

10,338. How far off the shore?—20 miles.

10,339–40. What is the name of it?—What we call the Foreland is the nearest ground we have here.

10,341. Have you fished on that ground yourself for many years?—No, I have not.

10,342. Is there any ground of which you have any experience personally that has been long fished in deep water here?—Not here. I have generally been in the North Sea in the summer time, and in the winter time I have gone to Rye Bay. I have got my living there ever since I came to my manhood.

10,343. I want to ascertain from you whether there is any particular ground in the deep sea you are in the habit of frequenting, of which you have any knowledge and experience such as to enable you to say whether the quantity of fish now caught is increasing or diminishing as compared with what was caught in former years?—Yes, I can speak with regard to the Foreland.

10,344. How long is it since you began to fish on that ground?—I have not been there myself, but I have seen others there. I have not been there to put a trawl out myself, but I have been there and seen it done.

10,345. Is the quantity of fish caught there increasing or diminishing?—It has increased this summer. There have been better catches this summer than for years.

10,346. Do many boats go on that ground?—Yes, a great many.

10,347. Have they for years been in the habit of going on that ground?—Yes, in the summer season.

10,348. And this summer they have had larger takes of fish than in previous summers?—Yes, of the sole kind.

10,349. And a greater number of boats has been engaged?—Yes.

10,350. Then is it your conviction that the quantity of fish has not diminished in consequence of the ground being repeatedly trawled upon?—Yes.

10,351. You think that your boats trawling over the same ground do not diminish the quantity of fish you find on the ground?—I believe not.

10,352. Have you ever found upon any ground you have been in the habit of trawling over that the fish have become gradually worn out; have you found the fish after you have been fishing for a succession of years gradually diminishing in quantity?—Sometimes there has been a diminution for a short time.

10,353. What do you mean by a short time; do you mean a particular season?—No. Perhaps we may have been trawling in a particular place for a time, and then we shift if the fish decrease.

10,354. That was always the case, I suppose? Is it not always the case that the fish shift from ground to ground?—Yes.

10,355. What I want to know is this, have you ever found any ground which you have repeatedly been in the habit of trawling upon where the supply of fish is diminishing on the whole, in consequence of your fishing so much?—No, it has never decreased except for a time. The fish sometimes take flights and shift about from place to place according to the season of the year.

10,356. Has it long been the custom for the fishermen here to go to the North Sea in the winter time?—Yes.

10,357. Do the fish leave the grounds you frequent in the winter time to go further north?—Yes.

10,358. Then you follow them not because the fish have diminished in quantity as a whole, but because they change their ground in that way?—Yes, they are not so near the shore in the winter time, and yet we are obliged to be near the shore. We have heavy gales of wind at times, and we want to be near a harbour.

10,359. Then partly on account of the season, and from a desire to have more sea-room, you go to the North Sea?—Yes, and because we get a greater quantity of fish.

10,360. You stated that a large quantity of vessels come from the westward and fish here?—Yes.

10,361. Do they go to the North Sea?—No, they keep on their own ground, and they go further out to sea occasionally.

10,362. When you are fishing in the North Sea, how do you get your fish sent to the market?—We either go with it ourselves, or send it by another smack.

10,363. How long can the fish be kept fresh on board the smacks in which they are caught?—If it is cold weather they may be kept for a week.

10,364. At the present time do you carry ice in your fishing smacks?—Not in the winter time.

10,365. Is there any ice in the vessels that are employed by the fishing smacks to carry the fish to market?—Not in the winter time, but in the summer time they carry ice.

10,366. Is ice not necessary in the winter time?—No.

10,367. How long will a fishing smack keep the sea without coming ashore at all?—Sometimes four or five weeks.

10,368. Is it common to do so?—They don't come into this port above once in four or five weeks.

10,369. But do they go into any other port?—Yes, it is according to the wind. They always go to the first market where they can bring their fish ashore.

10,370. In the process of trawl-fishing have you ever observed whether you trawl up the spawn of fish?—I never saw any in my life; I don't know what it is.

10,371. In the deep sea do you get many fish so mangled that you are obliged to throw them overboard as unfit for the market?—No.

10,372. Does that never occur in stormy weather?—No.

10,373. Do you think it would be advisable to adopt any regulation as to the length of the beam of the trawl?—No, I don't think there is any occasion for that. There is plenty of fish for every man to catch. The more they trawl the more the fish seem to be

RAMSGATE.

W. Clapp.

17 Oct. 1863.

there. They keep stirring up the ground, and they are constantly going over different ground. The trawl takes the roughness off, and the result is that the fish can then get at the food. By that means I think the quantity of fish has been increased by trawling rather than diminished.

10,374. Then, as a fisherman, you do not object to any additional number of fishing boats coming upon the fishing ground.—No.

10,375. You do not find that that diminishes the quantity you take?—No, as long as they keep out of the shallow water in the summer time I think they do no harm.

10,376. That is your only objection?—Yes.

10,377. Do you think it desirable that some regulation should be adopted to prevent that?—Yes. If, for instance, the French boats come they catch more fish than the English, and they drive us off the ground.

10,378. Have you ever seen any bruised or small fish sold as manure?—No, never.

10,379. Are there any skate caught off this coast?—Yes.

10,380. Is the quantity of skate caught here increasing or diminishing?—It is just about the same.

10,381. Is the price of fish increasing or diminishing?—It is increasing.

10,382. Speaking of 20 years ago and comparing it with the present time, what might be the price of a basket of fish, say plaice?—Where plaice would have brought 2*s.* 6*d.* then it will bring 5*s.* now.

10,383. Then has the price of fish doubled?—Yes, with regard to plaice the price has doubled, and that is owing to the railways. The fish can now be got into the different markets in a fit state to eat.

10,384. As to soles, what was the price 20 years ago compared with what it is now? I am speaking of the price given to the fishermen, and not that paid by the consumer.—There is a rise in that of fully one third.

10,385. Then has the price of plaice increased more than the price of soles?—Yes.

10,386. How is it with regard to whiting?—The price is about the same. I don't see any rise in whiting, but we do not catch any quantity of them, and we cannot send them any great distance without great care.

10,387. Is that because they are a softer fish?—Yes, they are a much softer fish, and they will not keep as long as other descriptions.

10,388. With regard to turbot and brill, what are the relative prices of those fish now compared with the price 20 years ago?—I think there is also a rise in the price of turbot and brill.

10,389. Is there a rise equal to the rise in the price of plaice—has the price doubled?—No, but there is a little rise.

10,390. Has there been any line-fishing off this place?—Not that I am aware of.

10,391. Never within your remembrance?—No.

10,392. Do the foreign boats of which you spoke just now only fish with the trawl?—Yes, and with lines also. They come close off Ramsgate Harbour, the Downs, and different places, and fish close inshore.

10,393. They fish with lines?—Yes.

10,394. Do they fish both with lines and with the trawl?—Yes.

10,395. Do any of the trawl fishermen here belong to the coast volunteers?—Yes, I believe there are a few.

10,396. Are there many?—No, not many, I think.

10,397. Is there any objection made to them on account of their not having been accumstomed to square-rigged vessels?—No, I do not think there is.

10,398. (*Professor Huxley.*) What proportion of small fish is caught by the trawl in deep water. You always catch a certain number of small fish, I presume?—We catch very few in the North Sea.

10,399. You catch small fish when you fish in the bays off the shore?—Yes, if we get along the shore we catch a great many small fish.

10,400. Do you catch many small fish when you are fishing off the Forelands, out in deep water?—No, nothing to speak of then.

10,401. Do you think the catch of haddocks has fallen off of late years?—There are but very few haddocks caught off here now.

10,402. Were there more caught off here formerly?—No, there used to be a few caught in the North Sea a few years ago, but we have left off catching them now.

10,403. I am speaking of this coast. Were there many caught off this coast in former years?—No.

10,404. Why is it that you do not practice your trawling off here in the winter?—Because there is no room for us. We like to have plenty of room in the winter. When we can drift about in the North Sea we should be obliged to be in the harbour if we were here. When it blows a gale of wind off this coast there is no room for us at all.

10,405. Suppose you had a good harbour that you could run into, would you not run in here?—No, we have a good harbour already, but we cannot get a living by being in a harbour, we are forced to be at sea in all gales of wind. If we are not, it is impossible for us to catch fish.

10,406. If an easterly gale came on, you would get in?—We don't want to get in. We want to be at sea no matter how hard it blows; but if we are near the shore off the Foreland we must come in if a gale comes on.

10,407. You have not got sea-room?—No.

10,408. Is that why you leave these grounds in the winter?—Yes.

10,409. Do the Torbay men fish here?—Not now.

10,410. Were they in the habit of doing so?—Yes, some few years ago.

10,411. Did they come up in their smacks?—Yes, in the winter season.

10,412. Did they live here?—Yes.

10,413. In Ramsgate itself?—Yes.

10,414. They don't do so now?—No.

10,415. Why is that?—Some go to Hull, some stop at home. They found out the Silver Pits, and then they went down to the Yorkshire coast, and made their home there.

10,416. They thought they could do better by going to the Silver Pits and making Hull their port?—Yes, they found that that would be to their advantage, and Hull being nearer for them they live at Hull now.

10,417. Have you ever been engaged in the herring-fishing?—No.

10,418. You were speaking just now of the French coming within the limits here a good deal?—Yes.

10,419. Are there any cruisers off the coast; I mean Revenue cruisers?—I have known one or two here, but the protection they give us is very little.

10,420. Suppose they saw a French vessel within the limits, what would they do?—I have known them take them into the harbour.

10,421. Have there been any cruisers here of late years?—Not up and down the coast. Occasionally there may have been a Revenue cutter about.

10,422. Do not the Revenue cutters cruise up and down here?—They may have done so last summer, but they don't make a general thing of it.

10,423. How many Revenue cruisers are stationed here?—Two.

10,424. What do they do with themselves if they don't cruise up and down the coast?—I don't know.

10,425. Notwithstanding their presence here, you do not think the French are much interfered with?—No.

10,426. And the French boats make it a practice to come fishing on the coast?—Yes.

10,427. You are aware that they are liable to seizure for doing so?—Yes.

10,428. Did you hear the regulations I read from the Convention about the length of the trawl beams?—Yes.

10,429. Did you ever hear of them before?—No.

10,430. Did any body ever examine the trawl beam

of your net in order to see if it was of the right length ?—No.

10,431. Did any body ever examine the mesh of your net ?—No.

10,432. In fact, nobody ever seems to meddle with you at all ?—No.

10,433. You did not know that you were breaking the law in having your beam too long ?—No.

10,434. Do you ever find yourself interfering with the herring fishermen or they with you ?—They interfere with us sometimes.

10,435. Did you ever hear of that regulation which I read just now in reference to herring-fishing ?—Yes.

10,436. I mean the regulation that obliges you to go away from them ?—They put their nets in after dark, and then we cannot see them.

10,437. I am not talking about what is possible but what is the law. The law is that you shall get three miles out of their way ?—Yes, but we cannot do that in the dark.

10,438. Have they no lights ?—Yes.

10,439. Cannot you see them ?—We cannot tell if the lights are herring lights or any other lights.

10,440. What sort of light is it they carry ?—A white light.

10,441. Are these regulations carried out: "In "order that boats fishing with drift-nets may be "easily recognized at night, the masters of these "boats shall hoist on one of their masts two lights, "one over the other, three feet apart. All fishermen "are forbidden, except in cases of absolute necessity, "to show lights under any other circumstances than "those mentioned in the present regulations." Now, is it your experience that the herring fishermen do not carry lights of that kind ?—I never saw but one light. They only carry one light.

10,442. If these regulations are carried out, of course it would be practicable to recognize the drift-net fishermen ?—Yes.

10,443. But you say they are not carried out ?—Yes, and as it is, it is very hard for us to get out of their way, more than it is for them to get out of ours.

10,444. I will read you another regulation. Article 26 says: "Whenever herring or mackerel boats shall "commence drift-net fishing in any place whatever, "the trawl-boats which may be already fishing in "such place shall depart therefrom, and shall keep "at a distance of at least three miles from the said "drift-net herring or mackerel boats." You see that the practical effect of that is that if you have got your trawl net down and are fishing for the night, and the herring men come and shoot near you, you must at once take up your trawl and go out of their way for a distance of three miles. Now that regulation which I have just read to you is the law as it at present stands. Do you think that it is a regulation which can be practically enforced ?—Do you mean with regard to hoisting two lights ?

10,445. No; the other one, which requires the trawlers to take up their nets and get out of the way ?—The evil is this: if the herring fishermen see a fleet of smacks, they like to get as near us as possible. They say that the nearer they are to the trawl-boats the more herrings they catch.

10,446. Did you ever hear of a trawler being brought before the magistrates for not getting out of the way ?—No.

10,447. Do you think it would be a just regulation if it were enforced, or do you think it would not inflict much hardship upon the trawlers ?—I think it would involve a very great amount of hardship upon the trawlers.

10,448. You think it would not be just for the trawlers to be obliged to get out of the way ?—No, because the herring boats follow the trawlers, and they say that they catch more herrings when they are near the trawlers.

10,449. At any rate nobody seems just now to trouble himself about the law ?—No.

10,450. What is the weight of the head irons of your trawl ?—Do you mean each head ?

10,451. Yes. From about 120 lbs. to 130 lbs.

10,452. One hundred and twenty pounds each head ?—Some may be heavier.

10,453. That is 240 lbs. between them ?—Some are only 180 lbs. the two.

10,454. Are any of them heavier than the weight you mentioned just now ?—There may be some a little heavier, but I do not think they are as a general rule.

10,455. Are you aware of any regulation on that subject ?—No.

10,456. Did you ever hear of this: "The total "weight of the two iron or head pieces of a trawl "shall not exceed 287 pounds ?"—No.

10,457. If you had a mind to make the weight 300 pounds you would do so ?—No.

10,458. You would not do so ?—We should if we thought it would be of any benefit to our fishing.

10,459. Just so. Do you load the ground-rope of your trawl with any weight, such as lead, or iron chains ?—We do sometimes when we are going on hard ground.

10,460. Do you put any particular weight on it ?—Sometimes we may put a little lead on, perhaps 12 or 15 pounds.

10,461. If you were inclined to put 2 or 3 cwt. on, I suppose you would do so ?—Yes, if we thought it would benefit us.

10,462. Have you ever heard of this: "The total "weight of iron chains or leads used for loading "the ground-rope of a trawl shall not exceed 110 "pounds" ?—We never exceed that weight.

10,463. Did you hear the regulation which I read about the size of the mesh of your trawl ?—Yes.

10,464. Did you ever hear of it before ?—I heard a little talk about it some years ago.

10,465. Did anybody ever meddle with your nets or examine them ?—Not here.

10,466. Did you ever hear of any trawler being interfered with on that ground ?—No.

10,467. Does your trawl-boat carry any vane ?—Some of the trawlers do.

10,468. What sort of a vane ?—A piece of bunting about a yard and a half long on the stock.

10,469. Not a square vane ?—No, a piece of bunting about a yard and a half long.

10,470. Then yours is a kind of pennant ?—Yes, we call it a vane.

10,571. Are the vanes of the boats of any particular colour ?—No; some have them red, some white, and some blue. Sometimes they will have none at all.

10,472. Then I suppose you never heard of this article: "For the purpose of distinguishing by day "drift-net fishing boats from trawl-boats, both shall "carry at the masthead vanes which shall be at least "eight inches in height, and two feet in length. The "colours of these vanes shall be, for British trawl-"boats, red; French trawl-boats, blue; British drift-"boats, white and red; French drift-boats, white "and blue. It is understood that vanes of drift boats "shall be divided vertically into two equal parts, of "which the white shall be nearest the mast." In your experience you do just as you like with regard to this matter ?—Yes.

10,473. And you have been fishing for 28 years ?—Yes.

10,474. You never heard of anybody trying to enforce the regulations ?—No.

14,475. Have you ever been at the herring-fishing ?—No.

10,476. (*Mr. Caird.*) Then I suppose the regulations which have been read to you by Professor Huxley, as they are not enforced, do not operate injuriously against the fishing here ?—No.

The witness withdrew.

RAMSGATE.

P. Bartlett.

17 Oct. 1863.

PHILIP BARTLETT called and examined.

10,477. (*Mr. Caird.*) Are you a smack owner and fisherman?—I am.

10,478. Have you been long engaged in the business?—Between 30 and 40 years.

10,479. Have you a practical knowledge of the fishing?—Quite so.

10,480. Have you during most of that time acted as a fisherman on board a trawl-vessel?—I have just resigned the sea; I have now been two years away from the fishing.

10,481. Are you interested in more vessels than one?—Yes; I have two.

10,482. I will put a question which you may answer or not as you like. When you first began fishing had you any interest in the property of a vessel?—No, not one halfpenny.

10,483. And you have gradually become an owner of trawl-vessels?—Yes.

10,484. Is it common for fishermen to become the owners or part owners of vessels?—Yes, very frequently through their own energy and industry.

10,485. Then, on the whole, you will say that it has been a profitable business?—Yes, but it is a lottery, like many other things. Some years it may fail. But take the business as it is, I should say that it is more on the rise than it is on the fall.

10,486. In the course of your experience you no doubt have seen great changes in the number of vessels employed in the trawl-fishing here. Can you tell us with accuracy what the number of boats was when you first began fishing, and what it is now?—I have been fishing on the Yorkshire coast a great deal of my time. I left there 10 years since and I came back again. I was born in Devonshire, but I left there when I was eight years of ago. When I left there were not more than 13 or 14 vessels. The Silver Pits had just been discovered, and great quantities of fish were being got there. At that time this was the mother port.

10,487-8. Do you mean the Silver Pits on the Yorkshire coast?—Yes, in the German Ocean, between the Dogger Bank and the Well Bank.

10,489. Do you agree with the previous witnesses with regard to the number of boats that hail from this port?—Yes.

10,490. And as to the increased size of the vessels and the increased size of the trawl?—I do not exactly agree with them with regard to the net. There is a variation in the opinion different trawlers entertain with regard to the nets, heads, and beams.

10,491. Is it your opinion that the fishermen should be controlled as to the size of the net, or that every fisherman should adopt his own course?—I think it ought to be optional. I should not like to be confined myself to any particular regulation, although I do not exceed the size laid down by the law.

10,492. Are your trawl beams under 38 feet in length?—Yes, and I find that I can get as good a living and earn quite as much money as those who have their beams 42 feet long.

10,493. Are the vessels of the same size?—No; some are 30 tons and some are much larger. We have vessels out of this port that that are 80 tons builder's measurement. My largest is 52, and the next is 47.

10,494. You are of opinion that the legal beam is long enough to enable you to get a good haul of fish?—Yes.

10,495. But you would not prevent other people from following their own fancy?—No, I should not like to put any restriction upon anybody.

10,496. You do not think the length of the beam affects the increase or the dimunition in the quantity of fish?—No, I think it is a great lottery when a man puts his trawl overboard whether he will get a large catch of fish or a small one, on account of the great variation in the ground itself.

10,497. Do you agree with the previous witnesses, that the practice is to follow the fish here in the summer, and then go to the North Sea in the winter?—Yes.

10,498. That is the usual course of fishing here?—Yes.

10,499. The course practised by all the boats in this port?—Yes.

10,500. Can you speak of your own knowledge as to the quantity of fish when you first began to fish, and the quantity now?—I can state that it has increased to a great extent

10,501. The quantity caught by each vessel?—Yes.

10,502. The quantity caught by each vessel has increased, and the number of vessels has much increased also?—Yes.

10,503. Then you would say that the whole quantity of fish caught by all the vessels hailing from this port has increased of late years?—Yes, to a great extent.

10,504. Has it increased in a larger proportion than the number of vessels?—Yes. Taking the average catch of one vessel, I think it will be found that each vessel averages about one third more now than it did 10 years ago, of all kinds of fish that swim on the fishing ground. Our nets do not take any fish that do not swim on the ground, but all that go there are taken into our nets.

10,505. In your experience, have the grounds you have been in the habit of fishing, begun to fall off in the quantity of fish they yield in consequence of your having passed over them for successive years with a trawl net?—No; only two years ago there was a very great increase of turbot, brill, doreys, and whiting, on the Falls Bank. The quantity was very much larger than it was 10 years ago.

10,506. Ten years before that?—Yes, since 1851. There was a greater quantity of fish taken off the Falls Bank in 1861 than in any year since 1851.

10,507. Was there a greater number of boats employed in the fishing?—Yes. I had one that never left the ground for four weeks.

10,508. It was always fishing on the same ground?—Yes, on one ground. But you want a particular wind, or you cannot fish this coast. The tide runs repeatedly across you, and parallel with the Bank.

10,509. Did you find that the other boats followed in the same track as your self?—They either bore N.N.E. or S.S.W.

10,510. Were all the boats following each other?—Yes, or else they would not have been on the Bank.

10,511. Is the Bank so narrow as that?—Yes, the Bank is as narrow as that.

10,512. How many boats follow each other?—Ten, 12, and perhaps 14 or 15 sometimes.

10,513. Do you all go over the same ground?—I am satisfied of it, and our nets are not above 20 fathoms from each other.

10,514. How long will that continue without intermission?—For two months or more. The fish continued on the Bank all the season.

10,515-7. Was plenty of fish caught all that time?—Yes, plenty. There were whitings in abundance. My opinion is that the fish were there in great abundance, and that when our vessel passed along part of them would see what they did not wish to see. Our nets and trawls flight the fish, and some of them escape, giving us a chance to take them the next time. We put our nets down in 30 fathoms of water, and we drag them down into water as shallow as between 4 and 5 fathoms.

10,518. It has been stated by some of the witnesses we have examined that the agitation caused by the trawl net in passing over the ground disturbs the food upon which the fish feed?—I believe that our nets by trawling over the ground often cause a certain skim of the bottom. They remove the upper part of the soil, and then the fish are enabled to find better food.

10,519. Have you ever drawn up any spawn in your nets?—Never.

10,520. Have you ever, when out in the deep sea,

drawn up young fish that were not marketable?—No; all the fish are saleable we bring to shore.

10,521. Are you never compelled to throw overboard small fish that have been brought up in the trawl?—No; I never visited those fishing grounds near the shore, such as Rye Bay, where the witness Gravells represented that so many small fish were trawled up. I have not fished within the headlands on the Kentish coast, but nine miles at least from the coast.

10,522. Have you ever noticed that some of the fish you bring up in the net are occasionally much mangled and partially destroyed?—No; and I have had so many fish in the net that it has taken four hours to get them out and yet I never saw one defaced or injured.

10,523. Did you never see one that had lost its scales?—Some of them might lose a few scales, but I never found them so injured as to be rendered unsaleable.

10,524. You never found them seriously damaged?—No; never seriously damaged, but in proper condition for the market. As soon as we hauled them on board their insides were taken out, they were packed into baskets and placed on board the luggers and cutters by which they were conveyed to the market. I am speaking now of when I was fishing off the Texel five years ago.

10,525. Have you observed that the French fishing boats come off this shore in the summer time and catch many small fish?—Do you mean the long-liners?

10,526. No, I am speaking now of the trawlers?—They do not come into our Gull Stream with their trawlers as the ground is against them, but I have known them on the south ground where there is a superior soil. They have often come there, but we have been given to understand that we have no jurisdiction that enables us to drive them away from that ground.

10,527. That is more than three miles from the coast, is it not?—Yes.

10,528. The limit fixed by the Act of Parliament is three miles?—Yes, one league.

10,529-30. Did you not hear one of the previous witnesses say that the French fishermen are constantly in the habit of coming close in-shore here to fish?—Yes, but I have not noticed them. I have not been in the habit of fishing there.

10,531. On the whole your evidence goes to show that the system of fishing adopted by the trawlers of this place has no tendency to diminish the quantity of fish brought into the market?—Yes.

10,532. On the fishing grounds on which you principally fish you have observed no signs that would lead you to the conclusion that trawl-fishing, as now practised here, is resulting in a diminution of the supply of fish?—Not in the least. On the contrary, I believe that the supply of fish has greatly increased.

10,533. Does that remark apply to the fishing grounds off this coast as well as those you frequent in the North Sea?—Yes.

10,534. You were not obliged to leave your own coast either in Devonshire or here because the quantity of fish was falling off?—No.

10,535. It has been stated to us that the Ramsgate and other fishermen having fished out all their own banks are obliged to go north. Do you believe in that?—Certainly not. I was fishing off the Yorkshire coast 15 years ago, and the takes of fish were nothing equal to what they have been since; yet the fish off this coast has been quite as plentiful. Since I have been at sea it has become a custom for the vessels engaged in trawling to go further out at sea than formerly. The vessels are therefore built of a superior size and quality, and they cost nearly as much again as they did. We are satisfied that it was necessary to augment the size of the vessels on our coast, but surely it would not have been a very judicious proceeding to have incurred so large an additional outlay if there were no fish to catch.

10,536. Then it is not true that you have been obliged to leave your own fishing grounds in consequence of their having been fished out?—No; if they told you that they were exaggerating to all intents and purposes.

10,537. Is there any particular kind of fish you take that is increasing or diminishing in quantity?—Generally speaking, I should say that the sole is the principal fish that has increased of late.

10,538. Has it increased?—Yes, the sole has increased to a great extent. There have been more soles landed here on this shore and on the Suffolk coast than has been known for these 20 years. That is a fact.

10,539. What do you attribute that to? Have you any idea what is the cause of it?—I attribute it to our vessels exploring the sea more and more every year. The more they do so the more fish they find. They fall in with grounds which have never been disturbed before, and they find great quantities of first-class fish.

10,540. Then do you think that in the whole of the bed of the sea between this and the Continent there is a great deal of unexplored ground still remaining?—Yes.

10,541. Is there any ground still existing that has not been much fished on?—Yes.

10,542. Are you continually coming upon new ground that has never before been fished on?—Yes, I firmly believe there is a great deal of ground that has never before been fished. For instance, there is the Hinder Bank. If our vessels would make up their minds to explore that bank I believe they would find a great quantity of all kinds of fish, especially turbot, brill, and dorey.

10,543. Where is that bank?—The Hinder Bank is on the coast of Belgium. The Belgian government have lately placed a lightship there. It is about 40 miles east from the North Foreland.

10,544-5. Is it near the coast of Belgium?—Yes, it is nearer the coast of Belgium than the coast of Great Britain. The Belgian government claim it and they have laid a lightship down there. The Belgian boats go there and fish now.

10,546. Then the banks there are not unexplored?—They go in and out and over and across the banks, but they do not fish as we do, parallel as the bank runs.

10,547. Do they fish their trawl-vessels in a different manner from yours?—The vessels themselves are on the same principle.

10,548. Then why do they fish them in a different manner?—I think they have not got the same insight into the matter that we have.

10,549. They don't understand it?—I think not.

10,550. You can fish with greater effect?—Yes.

10,551. And you catch more fish?—Yes, we reckon ourselves as British fishermen to be A 1. We do not allow any other fishermen to surpass us.

10,552. Have you ever come into collision with foreign fishermen on the banks you fish?—No; I never did but I have heard of vessels getting into collision with them.

10,553. It does not often happen?—No.

10,554. The two countries do not interfere much with each other?—No; but as far as that goes they rather overman us, and for that reason we wish to keep as clear of them as possible. But if it came to the push I don't know that we should be in any way frightened of them.

10,555. You have not made any objection to their fishing close in-shore?—They have made great objections to us and they have driven our vessels away. They have told us that they would take our boats in and fine them.

10,556. Do you know of any instance in which they have done so outside the three-mile limit?—Not of late.

10,557. Are there any other fishing grounds which you believe to exist that have been very little explored?—Yes.

10,558. How do you happen to know that?—By studying the chart, by seeing the different grounds that have been laid down by the Government surveyors, and by the account they give of them, together with the fact that experienced fishermen have told us that

RAMSGATE.

P. Bartlett.

17 Oct. 1863.

there is plenty of food there. That is the way the great Silver Pits were found out.

10,559. Do you suppose there are as many banks still undiscovered as there are regularly fished?—I cannot answer that question satisfactorily. I believe there are banks that have not yet been discovered or fished, but I will not say that there are as many in number as those which have been found out.

10,560. Do you think it would be of any advantage to you as a fisherman to be allowed by an international law to carry your fish into a foreign market near where you catch them?—If they did not put a duty on it would be, but it would not pay us if a heavy duty is imposed upon the fish.

10,561. But how would it be if you were placed on the same footing as the foreign fishermen themselves?—If they would not molest us or illtreat us it would very often pay us to go into a Belgian port, or into a port in French Flanders instead of coming to our own ports. For instance, we may be caught by prevailing winds dead against us, and in the countries I have mentioned being Roman Catholic countries, we have reason to believe that our fish would fetch a much higher price than we could get for it in England.

10,562. Then you would not object to allow foreigners to come to our ports and sell their fish here?—As far as I understand the matter the foreigner, under free trade, can do so now.

10,563. Do you think that you ought to have the same privilege?—Yes. We know that 20 or 30 sail of Belgian boats go into the Lowestoft market, and that they also send their fish to Billingsgate market, or any other market they choose, leaving the English fishermen to take pot luck.

10,564. Do any foreign boats come here to sell their fish?—Yes; when the prevailing winds are against them and they cannot get home. There are always buyers for them, and when they bring their fish in they lower the price here. Their fish has been frequently sold here. They find it better for themselves to sell their fish here for half its value than to have it spoilt altogether. But the fish generally fetches more money in their own ports than in England, and it is only in consequence of stress of weather that they are induced to come here.

10,565. Is it not because they receive in France a bounty upon the fish they bring in?—I don't think that is the reason.

10,566. You believe the real cause is that the price of fish is higher in a Catholic country?—Yes.

10,567. Do you think it would be a boon to the fishermen of this country if they were placed on a footing of equality with the foreign fishermen, and allowed to carry their fish to any market they think best?—Yes.

10,568. You approve of that?—Yes; I think it is only fair that we should be placed on a level footing with the foreign fishermen. Englishmen should be allowed to go to their ports on the same footing that they are allowed to come here. That is not so at present. I know that one of our men, about two years ago, offered fish for sale in a French port, and he nearly lost his life in consequence. There was no one to protect him. He was part owner of the vessel; and he was towed out just as it was coming dark, yet stones were thrown on board his vessel by gallon measures full.

10,569. Where was that?—At Dieppe.

10,570. Was he in the harbour there?—He had been engaged to carry two cargoes of fish, consisting of salt herrings, from Lowestoft to Dieppe, and he was molested in that manner by the foreigners each time.

10,571. Did he complain to the authorities?—I believe he did.

10,572. Did the foreign fishermen not give him an opportunity for disposing of his fish?—No.

10,573. Does any thing of that kind happen to foreigners in our ports?—I never knew of such a thing, but on the contrary, I have been given to understand that they have been treated as well, or better, than our own subjects.

10,574. No objection is made by the English fishermen to their coming here?—It causes a little ill-feeling sometimes. They say, "Why should foreigners be allowed to come here and trade and have no "duty on their fish, while the English fishermen, "when they take their fish to foreign ports, not only "have to pay a heavy duty, but harbour dues as well?" I have been obliged to put into a port in Holland to refit, and I have scarcely been in the harbour many minutes before the harbour master has called upon me for the harbour dues. I have said to him, "This is "very hard. Your vessels are allowed to come into our "ports and are exempted from charges of this kind, "why should we not have the same privilege in your "ports?" Their only answer is, "It is nothing to "us what your Government do. It is not for us to tell "your Government what they ought to do; but if you "come here you must pay our charges." I have been to Flushing to refit, to the Texel, and to Dieppe, and I have had to pay harbour dues each time.

10,575. Do you wish to see any regulation adopted by which trawling would be prevented within 10 fathoms of water, or within the headlands?—I think 10 fathoms is a very limited depth of water. In my notion, and according to my experience, when trawl-vessels come under that depth they are in a position to destroy a great quantity of fish.

10,576. Do you think that 10 fathoms would be a judicious line to adopt?—I think it would.

10,577. Do you imagine that there would be any advantage derived from preventing trawling within 10 fathoms of water?—I believe that it would be an advantage to the ground-fishermen in general. The fish would stop there until they became of sufficient size to render them saleable fish, and as the water became cold they would go further out to sea, and by that means they would be of benefit to the country, whereas, when they are caught in shallow water now, they are so young and so tender that they no sooner get in the net than they are drowned.

10,578. (*Professor Huxley.*) I understood you to state a short time ago that you were in one of the vessels that discovered the Silver Pits?—I was one of seven who were pretty nearly the first to explore the great Silver Pits.

10,579. How many years ago is that?—About 20 years ago. I never kept an account of such things, but I should say that it will be about 20 years ago.

10,580 How was it that the ground came to be called the Silver Pits?—The Government surveyors laid it down in the charts by that name.

10,581. Was it on account of the character of the bottom; was it because the bottom was white sand?—I cannot tell you that.

10,582. Was it found by accident, or what led you to go there?—The Dogger Bank and the Well Bank were first explored, and then they found this deep water, and they laid it down in the chart. The vessels that take their departure for the Baltic go over it.

10,583. Have you ever been concerned in any other fishing except trawling?—No.

10,584. Do you ever get oysters in your trawl?—Yes, we bring up a quantity sometimes.

10,585. Upon what ground do you find oysters?—At the end of the Silver Pits, in 25 fathoms of water. They would soon fill the nets if we did not prevent it, and would be such a dead weight that they would break the net away. I have been fishing in the latitude of Heligoland when I have got nothing but a body of oysters.

10,586. Did you hear the regulations I read to the last witness in reference to the trawlers and the drift-net fishermen?—Yes.

10,587. Do you think that the enforcement of those regulations would be felt as a hardship by the trawlers?—No; if the drift-net men carried the lights they are bound to carry.

10,588. Suppose they did so, and that the trawlers could distinguish them, do you think in that case that it would be a hardship for the trawlers to have to get

out of the way ?—Not at all, because I think that all who follow the fishing trade should have an opportunity of getting a livelihood. If these boats carried their distinctive lights then the trawlers could say : " That " is not a sailing vessel, but a drift-vessel. We had " better get out of their way and go an hour's sail " from here, when, if there are any fish on the " surface of the sea, they will take them and go home " again."

10,589. How long does it ordinarily take to haul up the trawl net ?—All depends upon the weather. In fine trawling weather, when we can work the trawl easily, we allow ourselves an hour or an hour and a quarter to get up the trawl and put it down again.

10,590. Then it would not be any particular hardship for your smack's crew to have to do that in order to get out of the way of the drift-nets ?—No, I should agree with that rather than disagree with it. But if the drift-net men do not make their lights clearly distinguishable then it it shall not be sufficient for them to say " I was about to put my lights up when the " trawler got his gear down."

10,591. That is the point I want to bring you to. Suppose you have your trawl down, and have turned in and made yourself comfortable as I suppose you do occasionally, would you not think it hard to be compelled to get out of the way ?—We require rest at sea as much as on shore.

10,592. Suppose that under such circumstances a drift-boat on the look-out for herring drifts with her nets within a quarter of a mile of you, the law says that the moment she does so you must take up your gear and get out of the way. Would you like to see that regulation enforced ?—We have heard of that restriction from the Board of Trade. A vessel with a ground-net is supposed to be stationary, and as soon as our vessel is round we are bound to put up a globe light to reflect the horizon. If the ground-fisherman does not do that he lays himself open to get his net up again and go three miles off ; but if the light is exhibited, and certain drift-net fishermen will persist in putting their nets down so that they drift upon him, then I think they ought to be answerable for the destruction that may happen to their gear. If our vessels do not exhibit a proper light, and the drift-net fishermen come across us, then we should be answerable.

10,593. But what I want to show you is, that whether you show a light or not, as the law stands at present, if you have your trawl down or up, the moment a drift-net comes within a certain distance of you, you are bound, if the trawl is down, to take it up and go away for a distance of three miles. Would the enforcement of that regulation inflict any hardship upon you ?—Yes, if the drift men came upon us in the dark.

10,594. But this law is absolute ?—I knew a case, before I came from Yorkshire in which proceedings were taken against a trawler for fouling drift-nets. It was tried in three different courts. The Yorkshire fishermen swore that they had the lights exhibited on their boat, but the ground-fisherman swore they had not, and yet he had to pay all the costs and damages.

10,595. When did that take place ?—It took place, I think, in the year 1852 or 1853. One of the men on board the vessel is now sailing from this port. He has just gone out of one of my vessels to start for himself. The vessel to which he belonged at the time the nets were fouled is the property of Mr. Nichol.

10,596. How did the case arise ?—It arose in this way. The ground-fishing vessel was riding fast. The drift men drove across him and parted their gear, which it was impossible to avoid, as it was blowing heavily at the time. The drift men in the morning saw the vessel, and going up to the trawler said, "You have cut my nets adrift ; I am now the "loser of so many." They took his number and proceeded to the shore, where they gave information to the owner of the drift-nets. The owner applied to the owner of the smack for compensation, but he said he could do nothing in the matter until he had seen the master of his boat, but as soon as the vessel came in he would cross-question him on the subject, and if he found that the injury had been done wilfully or through negligence he would make compensation. When the boat arrived he had the master at his house and questioned him on the subject. He gave an account of his stewardship ; told how it happened and what was the cause of it. The owner then communicated with the owner of the herring boat, stating that he did not consider that his vessel was at all to blame, because there were no herring boats near him when it became dark. He also stated that unfortunately the vessel became fast with the net at the bottom, so that it could not be cleared, and that the herring boat then drove across and parted the ropes. It appears that the herring man belonged to a club which assists one another in prosecutions of this kind. He brought an action against the owner. I think the case was tried in the first instance at Bridlington, and it was given in favour of the ground-fisherman. The owner of the herring boat applied for a new trial, and it was heard in the High Court of Yorkshire, I think at Sheffield. There they gave it against the ground-fisherman.

10,597. When was that ?—That would be either in 1851 or 1852. One of the men now sailing out of this port was in the boat at the time.

10,598. Did you ever in your experience find yourself meddled with, or your nets and gear damaged by anybody ?—No ; I have been told that there was such an Act of Parliament as that from which you have been reading to-day, but I have always been given to understand that there was no jurisdiction in the hands of the Government outside of a bay, and that it does not apply to the deep-sea fisheries.

10,599. Then you may take it from me that it applies equally to the deep-sea fisheries.—I always understood that the Government had nothing to do with it unless we were caught in the bays.

10,600. You are quite mistaken. —Then why do they not interfere with the vessels that are right under their notice every day in Billingsgate ?

10,601. What vessels ? — The Barking vessels. They have a smaller mesh and everything than we have.

10,602. (*Mr. Caird.*) Are they trawl-boats ?—Yes. Barking was pretty nearly the mother port of this coast before the fishing grounds were found off the Yorkshire coast.

10,603. (*Professor Huxley.*) Do you mean that Barking is the place where trawling originated ?—Yes ; and the largest vessels that ever go out go from Barking. They are those splendid cutters that carry the fish from the North Sea to Billingsgate.

10,604. (*Mr. Caird.*) Do you find that there are any existing legislative restrictions that operate against the fishery here ?—Not in the least.

10,605. Nothing interferes with you ?—No.

10,606. No fishery officer interferes with the size of your mesh, the length of your beam, or in any way regulates your mode of fishing ?—No more than that the Customs interfere with the numbering of our vessels. We are bound to carry numbers on the bow of our vessel and on our mainsail.

10,607. Does that do any injury to you ?—Yes, it does us a great injury. I wonder we have not often had a great loss of life and property in consequence of their requiring the numbers to be painted on the sails.

10,608. How is that ?—The white lead used in the paint is of such a perilous nature, and the canvas is so pliable that it works and breaks up all down where the figures are painted.

10,609. Does the paint injure the sail ?—Yes.

10,610. Does it cause the sail to wear out sooner where it is painted ?—It always breaks away there before any other part, and yet we are bound by the collector of Customs to carry it on the body of the sail above the close reef.

10,611. Do you find that the sail gives way there first ?—Yes.

RAMSGATE.

P. Bartlett.

17 Oct. 1863.

10,612. What is that caused by?—By the white lead used in the paint.

10,613. Is there any other mode that could be adopted for numbering the vessels without injuring the sails?—I think the painting of the number on the bow of the vessel is quite sufficient.

10,614. Could not some distinguishing pennant be adopted?—I think not. But if the vessel were well numbered on the bow, and the numbers kept well faced, that would be quite sufficient.

10,615. Are the numbers on the sail and on the bow just the same?—Yes.

10,616. The same letters and numbers?—Yes.

10,617. One is a repetition of the other?—Yes.

10,618. You think if the numbers are plainly put on the bow there is no occasion to repeat them on the sail of the vessel?—Not in the least.

10,619. Have you heard other fishermen complain in consequence of being obliged to paint the numbers on the sail?—Yes, a great number laid themselves under the necessity of being summoned for not complying with the regulation. I did so myself. I submitted to be summoned and paid the expenses.

10,620. Is there any other substance that can be used?—The Act of Parliament specifies that they shall be painted with pure white lead on a tanned or black sail, and in black oil colour on white sails.

10,621. Is that as injurious as the white paint?—Yes, it causes the sail to become hard and harsh in the part where it is painted.

10,622. Are the foreign boats obliged to have their numbers painted on the sails in a similar manner?—They are not under such restrictions as we are. The Boulogne fishing vessels carry their numbers on the peak of the sail.

10,623. If you carried yours on the peak of the sail would it be less injurious?—I think so. It is very injurious as it is now.

10,624. You do not want your sails numbered at all?—No, not the sails. We appealed against the regulation, but we were not successful, and were obliged to submit. If there should hereafter be an instance of great loss of life and property occurring through this regulation being enforced, perhaps the Board of Trade will take the matter into their consideration and give us an exemption in future. There is one other matter I wish to mention. A friend of mine tells me that our vessels come under the Board of Trade now, and that we are subject to all their rules and regulations; if that is so, I should be glad if they will consider the propriety of exempting us in future from wearing a number on our sails.

10,625. You desire to be exempted from the necessity of wearing a number on the sail?—Yes, and that is the opinion of all of us, both owners and men.

The witness withdrew.

L. Finch.

LEWIS FINCH called and examined.

10,626. (*Mr. Caird.*) You are a fish salesman and buyer here, I believe?—Yes, I am a fish salesman.

10,627. You buy fish of the fishermen?—Yes, and I sell it by retail.

10,628. Do you send it to the London market?—Not at present. I used to do so years ago.

10,629. Do you find that you have a sufficient sale for it in your own neighbourhood?—Yes, I can sell quite as much as I buy.

10,630. Do you buy a large proportion of the fish brought here?—No.

10,631. How long have you been engaged in the business?—12 years.

10,632. Do you find that the quantity of fish brought to the market by the fishermen here is as great now as it was 12 years ago?—Yes, and greater.

10,633. Is it much greater?—The bulk is much greater, and the price is much higher.

10,634. How much greater is the bulk than it was 12 years ago? Is there twice as much fish?—I should say that there is without any exaggeration.

10,635. Has it been a gradual or a sudden increase?—There has not been a sudden increase, but as the smacks have increased more fish has been brought into the market.

10,636. During the experience you have had has there been any time during which the quantity has declined?—Never, if the wind has been at all favourable.

10,637. The average quantity has been increasing gradually?—Yes.

10,638. And at this moment it is greater than in any previous year?—Yes.

10,639. Has any particular kind of fish increased more than another?—I have not observed any difference.

10,640. The proportions of the different kinds of fish caught keep pretty much alike?—Yes.

10,641. And the large proportion is plaice?—Yes, in the winter, and there are a great many small plaice in the summer.

10,642. Is the proportion of plaice larger than of soles?—Yes.

10,643. There is a small quantity of whiting, turbot and brill?—Yes.

10,644. Are the size and the quality of the fish as good as they were formerly?—They are quite equal.

10,645. Do you ever get any fish here in this market that have been caught by the line?—No, nothing to speak of at all.

10,646. Have you ever observed any difference in the quality of the line-fish and the trawl-fish?—The line-fish used to be decidedly better some years ago. In fact it has almost dropped off altogether.

10,647. Has the line-fishing been given up?—Yes.

10,648. Was it ever practised here?—Yes, for cods in the winter.

10,649. Do the men by whom it was carried on go to the trawl-fishing?—No, they are principally boatmen.

10,650. I understand you to say that the quality of the fish caught by the line was superior. In what way was it superior; was it brought into the market in a fresher state?—Do you ask if the fish was superior?

10,651. Yes, you said so, did you not?—No, it was superior only in the quantity, not in the quality.

10,652. Have you ever observed any distinction in the quality of the fish caught by the line, and that caught by the trawl?—Give me trawl-fish to all intents and purposes.

10,653. Did you ever find when the fish was brought to market that it had been injured by the trawl?—Never.

10,654. Nor mangled in any way?—No.

10,655. You have never found that the fish have been unsaleable in consequence of being mangled by the trawl net?—No, never, not in any quantity. Occasionally a sole might have its head broken or so.

10,656. Has the price of fish much increased?—It has increased double.

10,657. Has the price of all kinds of fish increased?—For what I had to pay 10*s.* 12 years ago I now pay 1*l.*

10,658. Then the fishermen get more for their fish now?—Yes. The facilities for getting it away are much better now than they were formerly, and it now finds its way to many inland places that never got a piece of fresh fish formerly.

10,659. You do not send it away yourself; you confine yourself to selling it here?—Yes.

10,660. (*Professor Huxley.*) Do you buy the herrings that are brought in here?—Not to any large extent.

10,661. Is there any large quantity brought in here?—At times a very large quantity.

10,662. What time does your herring-fishing begin?—It is beginning now.

10,663. What condition are the fish in?—Very good.

10,664. Are they mateys, or full fish, or what are they?—They are nearly full fish.

10,665. When do they become quite full?—In November.

10,666. Do you ever get full fish here in January?—No, not on this coast.

10,667. Is there any herring here at all in January?—Never.

10,668. Do they disappear about December?—Even before then.

10,669. Before December?—Yes.

10,670. Do you get sprats here?—Yes, off Margate and off Ramsgate.

10,671. Do they fish for them?—No.

10,672. If they don't fish them they are not likely to get them?—They did years ago but they have given it up.

10,673. Is there no fishing for sprats in Pegwell Bay?—No.

10,674. They fish for shrimps there?—Yes.

10,675. Are you a shrimp buyer?—Yes.

10,676. Is there a large quantity of shrimps caught there?—At times.

10,677. How are they caught?—By a hand-net.

10,678. Do the fishers push the net before them?—Yes.

10,679. What is the size of the mesh?—It is very small. I don't know the size.

10,680. Do they catch a good many small fish in their shrimp nets?—Yes, a good many.

10,681. What do they do with them?—They fling a great number over. What they cannot take home they destroy.

10,682. They have no sale for fish of that size?—No, they are no bigger than a sixpence.

10,683. Are there any particular times when they get a great quantity of small fish?—Not being a shrimper I cannot answer the question, but I think there is no doubt that the brood of fish generally comes into shallow water.

10,684. Is there any oyster fishery off this part?—No, there is no oyster fishery.

10,685. None at all?—No.

10,686. Do you buy haddocks when you can get them?—Yes, when I can get them.

10,687. Have you long been a fish dealer here?—For 12 years.

10,688. Have you noticed any difference in the supply of haddocks here?—We get none now off our coast.

10,689. Did you get them 12 years ago?—No, it was before my time.

10,690. Are there any crabs or lobsters got off this coast?—Yes, small ones.

10,691. The shore crabs, you mean?—Yes.

10,692. Not the big crabs?—No.

10,693. Do you get any lobsters?—Only a few, not many.

10,694. Are they caught in lobster pots?—Yes.

10,695. Set round the coast?—Yes.

10,696. In rocky places?—A little outside the rocks in deeper water; but you cannot call it a lobster fishery here.

10,697. How are the shore crabs caught here?—They are also caught with the pots.

10,698. Are the pots baited for them?—They catch the crabs in the same pots as the lobsters.

The witness withdrew.

ROBERT COOK called and examined.

10,699. (*Mr. Caird.*) Have you been a long-line fisherman here?—I have been 48 years here and at Margate, which is not far from here.

10,700. Have you also been a trawl fisherman?—Yes.

10,701. All that time?—Yes.

10,702. Have you followed any other kind of fishing?—Yes; I have followed all sorts of fishing; sprat-fishing, mackerel-fishing, herring-fishing, and trawl-fishing. In my younger days we used to make four seasons of the sea. We were three months at sprat-catching, three months at trawl-fishing; then there was the herring season and the mackerel season, making in all 12 months. That was in my younger days.

10,703. The herring season and the mackerel season occupied the other six months?—Yes.

10,704. What three months of the year was the sprat-fishing?—December, January, and February.

10,705. And the trawl-fishing?—We used to begin the trawl-fishing about May, about the second week in May, and that would last for a week or two in July.

10,706. May, June, and July?—Yes.

10,707. Then the herring-fishing?—That used to begin about the first or second week in October.

10,708. Had you nothing to do in August and September?—We used to go trawling then.

10,709. I thought you said you went trawling from May until July?—We used to begin trawling as soon as the mackerel season was over, in July, and we kept on with that until September.

10,710. When did the mackerel-fishing begin?—In May.

10,711. That is the mistake you made. You followed that until July?—Yes, and then we went trawling.

10,712. And then in October the herring-fishing began?—Yes, and as soon as the herring season was over the sprat-fishing began.

10,713. When did any change in that fishing take place? You say that occurred in your younger days?—There were no smacks here at that time. We used to go trawling in the summer season.

10,714. There were no large trawl-vessels then?—No.

10,715. None that could go into the deep sea?—No.

10,716. You trawled in the bays in-shore?—No; off the Kentish Knock, up to 10 and 18 miles off; right off the North Foreland.

10,717. Were they open boats or decked boats?—Decked boats.

10,718. What was their tonnage?—They varied from about 20 tons up to about 35. That was according to the old measurement. They would not measure that now.

10,719. They never went into the deep sea at all?—No.

10,720. When you were fishing in the months of July and August in-shore with those boats, were you in the habit of catching many small fish?—We did not get many small fish. If we got close into the bays, we should catch small fish, but we used to go further off.

10,721. You did not desire to catch small fish?—No; now and then when it was blowing a bit, we got into the bays to make a week's work, and then we caught small fish.

10,722. Then afterwards you went to sea?—We followed the times, and went into bigger vessels.

10,723. You would not then follow sprat-fishing so much?—No; I have not followed that for 28 years.

10,724. Does the trawl-fishing find employment during the whole of the year for the trawl fishermen?—Yes.

10,725. So that if the other modes of fishing have to be carried on, they must be carried on by other fishermen?—Yes.

10,726. Do you agree that the number of vessels has increased very much in your experience?—Yes.

10,727. Do you find that the quantity you can take in each boat has increased or diminished?—Well; I recollect when I would go and toil all day and night in one of those vessels of 30 tons, and I could bring all the soles and plaice I caught ashore in a basket, and now going over the same ground for the same length of time we should require 20 baskets.

10,728. Are you quite positive in speaking of that as a fact within your knowledge?—Yes; it is a fact within my own knowledge. My father was a fisherman

RAMSGATE.

R. Cook.

17 Oct. 1863.

all his lifetime before me, and he never saw Yarmouth in all his life. He never saw Hastings but once. He lived until he was 82, and he was always fishing about this country with trawlers. I know that he came ashore once when he had had good luck, and had caught 20 thornbacks. He sold them for 20 crowns, and they are so plentiful now that I do not think my friend here would like to give me more than half a crown for them.

10,729. Then that kind of fish has much increased instead of having diminished?—Yes, very much indeed.

10,730. Have all other kinds of fish increased?—Yes; all the fish I know of. They have all increased on these grounds. I think this summer that more fish has been taken off these grounds than was ever known in all my experience.

10,731. Do they fish now on the same ground they did then?—They go fishing on the same ground that I was fishing on 48 years ago, and all the summer time you will see the trawlers trawling over a piece of ground not a quarter or the tenth part of a mile broad; day after day, day after day, away go the trawlers over this piece of ground, and they catch an abundance of fish.

10,732. They have done so this summer?—Yes, and they are doing so at the present moment.

10,733. In what depth of water do they fish?—It varies from 10 to 11 and 12 fathoms. It is off the banks, and we can go in 10, 11, and 12 fathoms up to 17 fathoms.

10,734. What distance is that from the shore?—About 11 or 12 miles.

10,735. Then it is not in-shore fishing?—No.

10,736. Not the bay-fishing of which we have heard?—Not a bit of it.

10,737. It is deep-sea fishing?—You may call it deep-sea fishing.

10,738. You have heard the evidence of the other witnesses as to the quantities of small fish caught by trawling in the bays in the summer time; do you agree with that?—I think it is wrong, in the summer time, to take the small fish that come in the bays to spawn.

10,739. Do you think it would be right to adopt a regulation that all trawlers should be excluded from the bays in the summer season?—Yes. I think it would be plenty nigh enough to keep them in 10 fathoms of water. They should not come in nearer.

10,740. You think it would be of general advantage if no trawling was allowed to take place within 10 fathoms of water?—Yes.

10,741. Would you apply that to the whole year, or only to part of the year?—I don't think it would make much difference in the winter season, because there are no fish there then. In fine weather the fish come into the bays to spawn, and when the water gets cold the same fish naturally take to deep water.

10,742. Then you think it would be better to enforce the regulation for the whole year, and make it applicable throughout the year?—Yes, I think so. They would not take the trouble to fish in the bays in the winter time, because there is nothing then for them to catch.

10,743. Do they catch much small fish in the deep water to which you have referred, where the trawlers are constantly fishing?—They have caught great quantities of small fish in the height of the summer.

10,744. What do they do with them?—They shovel them overboard as fast as they take them.

10,745. They are of no use for the market?—No; they will heave up in the trawl sometimes as much as half a ton of fish, and more than 5 cwt. out of that half ton will be thrown overboard again.

10,746. That is half the whole catch?—Yes, half the weight is sometimes thrown overboard.

10,747. Are the fish alive or dead when they are thrown overboard?—A great quantity is alive, but some are dead.

10,748. Do you think that much destruction takes place in that way among the fish?—I do not think the destruction is very great. The more we trawl the more the fish come.

10,749. Do you drag up again any of those you throw overboard?—I never saw anything to lead me to suppose so.

10,750. Could you discover it; would you know them again as the same fish?—Yes; now and then we may have trawled up such a thing as a thornback, or the bone of a skate that has been dead.

10,751. Do you ever drag up any spawn?—I never saw any. I should not know what it was if I was to see it.

10,752. Nothing of that kind is ever taken up by the net?—Nothing of that kind is taken up here.

10,753. Did you ever notice whether the fish were much mangled when they were brought up by the net?—No, they are not.

10,754. Not in any kind of weather that you experience?—No; except now and then when a sole has put his head through the mesh and has got a bit of a rub. In such a case we put the fish into the pan.

10,755. You cook it on board?—Yes.

10,756. Have you observed whether the French or foreign fishermen come in here and fish close in-shore?—I have seen them close in-shore about Rye Bay and Hastings, but there is not much trawling ground for them to come upon here. I have seen them here with their lines.

10,757. Do you think it would be desirable to adopt any regulations as to the size and length of the beam of the trawl?—No.

10,758. Or with regard to the size of the mesh of the net?—No; I think the fishermen can regulate those matters better for themselves. In a smack of 80 tons they want larger nets and a larger beam, and larger heads to keep the net at the bottom. I think it is better that they should be allowed to regulate their own nets.

10,759. Do you think it is necessary to regulate the size of the vessels?—No.

10,760. You think it would be better to leave the fishermen to regulate those matters themselves?—I think they are under very good regulations now.

10,761. That is because there is no regulation at all; is that what you mean?—There is no regulation now. One may have a vessel 50 tons, another 60, and another 70.

10,762. You desire to be left to follow your own opinions entirely?—Yes.

10,763. With regard to the size of the mesh of the trawl net, would you desire every man to exercise his own will about that?—With regard to the size they have had latterly, it has been the same sized mesh I have seen all my lifetime, and the same sized mesh my father learned me to use. It don't hurt anything.

10,764. You have not altered the size in any way?—Never, in my time.

10,765. Did you hear a previous witness say that at Barking they use a much smaller mesh?—Yes; I have seen their meshes. They are much smaller.

10,766. Do they derive any advantage from that?—I should think that they catch more small soles.

10,767. Would that be of no advantage to you?—No, we want to get good fish.

10,768. Do you think it would be an advantage to prevent the fishermen from using a net that would catch these small fish?—Along the bays I think it is very disadvantageous to catch them, but I think the size of the mesh used in the North Sea would make very little difference.

10,769. (*Professor Huxley.*) Perhaps you will be good enough to tell me about the mackerel-fishing; is the mackerel-fishing practised now?—Very little about here.

10,770. How was it practised, by the hook-and-line, or by net-fishing?—By net-fishing.

10,771. With drift-nets?—Yes.

10,772. Like the herring nets?—Yes.

RAMSGATE.

R. Cook.

17 Oct. 1863

10,773. Is there no such fishing as that carried on now?—Yes, about the months of May and June we have a few boats that come up from Folkestone and Deal.

10,774. They do not fish from this port?—A good many of them come to this port; the Hastings fishermen come here.

10,775. The fishermen of this port do not practice that fishing?—No.

10,776. Why have they given it up?—I never knew any mackerel boats about here at all, but there were some at Margate, about four miles from here when I was a resident there.

10,777. I speak of Margate as well; do any mackerel fishermen go out from there now?—A few.

10,778. Are there not as many as there were formerly?—No.

10,779. Why not?—They could not make it answer, I suppose. They do not care about following it up like the Hastings men who have larger boats; I suppose they found other employment the same as we did with the trawlers, andtherefore they did not follow it up.

The witness withdrew.

S. E. Dixon.

Samuel Elgar Dixon called and examined.

10,780. (*Mr. Caird.*) You are the chief officer of the Coastguard here?—Yes.

10,781. Have you been long in that position?—I have been nine months at Ramsgate, but I was at Pegwell Bay for about five years.

10,782. Then I suppose you have had, from the observations you have made, some experience of the different kinds of fishing practised on this coast?—Yes, not only on this coast, but from the Shetland Islands to the Land's End. I have been engaged within those parts both on shore and afloat.

10,783. Have you observed since you have been at Pegwell Bay that the supply of fish has increased or diminished?—There are very few fish caught in Pegwell Bay; it is only shrimps that they catch there.

10,784. I do not wish to confine you to Pegwell Bay, but to that part of the coast to which your attention has lately been directed?—The quantity of fish will depend on the number of trawlers. They do not always stop exactly on one spot.

10,785. Do you think they are making as good a business of it now as they did formerly?—I think that they are increasing compared with what they were 10 or 20 years ago.

10,786. There is no doubt that they are increasing in number?—And in the fish they take as well.

10,787. You think that the quantity of fish they take is increasing?—Yes, I think so.

10,788. Have you been on the fishing grounds where the trawlers principally trawl?—Yes, I think I have been on every part over which they trawl, from the Shetland Islands to the Land's End.

10,789. There is no trawling in the Shetland Islands is there?—No, there is none there.

10,790. Where do you first meet with the trawlers?—20 years ago they got up as far as the Silver Pits, and now I think they have got as far as Flamborough Head.

10,791. They have got further than that, on the Dogger Bank?—They are the cod men, the long-liners; I have seen them on the Brown Bank, away on the coast of Holland; they are principally large Barking vessels with wells in them; they are in the habit of stowing their fish in trunks.

10,792. How long is it since you first saw the trawlers?—About 20 years ago.

10,793. Has your attention been directed to any particular ground upon which trawling has been practised during these 20 years?—The most smacks I have seen have been off Smiths Knoll.

10,794. Where is that?—Off Yarmouth, between Yarmouth and the Brown Bank.

10,795. How long is it since that piece of ground was first fished?—It has been fished for more than 30 years; I have not been there for these 10 years, and I think the fishing has somewhat fallen off, and that they now work further to the north.

10,796. You cannot speak of this piece of ground of your own knowledge within the last 10 years?—No, I have been ashore for 12 years.

10,797. Is there any ground in reference to which you can speak of your own knowledge up to the present time?—I believe that they catch the most fish away down at the Silver Pits.

10,798. From your own knowledge of the Silver Pits, do you know that that piece of ground is yielding a larger quantity of fish than when you first knew it?—When I was first in the North, Yarmouth was the station I was at, and there was no fishing there then at all.

10,799. When the Silver Pits were dlscovered did they begin to fish there?—Yes; and they caught great quantities of fish until I left the station 15 years ago. When I left I went round to Torbay.

10,800. During the time you were acquainted with the locality, had the fishermen been catching increased quantities or had the catch fallen off?—I should say that thesmacks got increased quantities. I judged that from the larger number of vessels that were taking part in the fishing.

10,801. Are you acquainted with any ground the history and gradual progress of which you can tell us, particularly whether the supply of fish has increased, diminished, or remained stationary?—I do not think it has diminished in that part.

10,802. In what part?—In the Silver Pits, Smiths Knoll, and the Brown Bank.

10,803. Can you speak of your own knowledge of any particular ground?—I cannot say what they have been doing within the last 15 years, because I have not been there.

10,804. Have you seen the French fishermen come off here to fish close in the bay?—If I was to see them fishing close in the bay I should put off directly and take them into the harbour.

10,805. Did you hear the evidence given to-day that they are in the habit of fishing in-shore?—Yes; I heard it, and I have taken notes of it.

10,806. You say that you have not observed them fishing in the bays?—No.

10,807. Should you think it your duty to order them off?—I should not only order them off, but I should launch a boat directly and take them up before the magistrates.

10,808. On what ground would you do that?—On the ground that they had committed a breach of the Convention between this country and France.

10,809. You feel that you are authorized to do so?—Yes; if they are within three miles of the coast.

10,810. Have you ever had occasion to do so?—No; but I think the cutters have brought in four this summer.

10,811. Off your station?—Yes, in this division.

10,812. On your station?—Between this and Dover and off the Foreland. They were not trawling. I have never seen one trawling here.

10,813. Did you not hear the witness say that they have been trawling here?—(*The witness Philip Bartlett.*)—They have not been fishing off this coast, not nearer than nine miles. They have been fishing off Rye Bay. There is no trawling ground here, or no doubt they would come close in. They shoot their lines in the full stream.

10,814. (*Mr. Caird to Dixon.*)—Have you interfered with respect to the numbers of the boats on the sails?—Yes; when these regulations first came out we did. We told the fishermen that if we found their boats unmarked we should bring them in.

10,815. Have you any occasion to enforce these regulations now?—No; I do not think there are any vessels out of Ramsgate that are not numbered.

10,816. You heard the last witness state that injury

RAMSGATE.

S. E. Dixon.

17 Oct. 1863.

is done to the sail in consequence of being required to paint the number upon it?—Very likely he is correct. The paint would make the sail very stiff and hard, and as the rest of the canvas would be soft and limp, it is most probable that it would give way in the part that was painted, or between the painted part and that which was not painted. I think it would be very apt to give way there.

10,817. The French boats, he stated, have their numbers marked nearer the peak?—Yes. I think that would be better for our boats.

10,818. Do you require them at present to have the number painted on any particular part of the sail?—Yes; they are required to place the numbers about the third reef?

10,819. May they not put them nearer the peak; is there anything to prevent the fishermen from placing the number anywhere above the reef points that they like?—No.

10,820. If they choose to put it nearer the peak, there would be no objection?—No; I think it would be better and easier to see.

10,821. Speaking generally, when you are at sea, could you distinguish the numbers painted on the boat itself if they were not placed on the sail?—We could not see the number as far on the boat as upon the sail.

10,822. Then it enables you to see the numbers at a greater distance?—Yes; with a good glass we can see a boat for four or five miles.

10,823. Is there any occasion for that?—We know then generally what port or fishery they belong to. In addition to the number they have the first and last letter of the name of the port to which they belong. You can make out the number and name from the vessel's mainsail when you can scarcely see the hull of the vessel at all.

10,824. But for the enforcement of these regulations and in seeing that the fisheries are properly conducted, is there any necessity for that?—Not now. I think it was done principally to prevent smuggling. They adopted it at first to follow the example of the French.

10,825. What I want to know is, whether or not the regulations compelling the fishermen to paint the number of the boat on the sail might be departed from altogether without any inconvenience to those employed in enforcing the regulations with regard to the fisheries?—I think it may be departed from as long as the number is painted on the bow.

10,826. Would that be sufficient to enable you to establish the identity of any boat?—Yes, if the letters and figures were of a proper size.

10,827. If they were of the full size mentioned in the convention?—Yes, provided they were always kept well painted.

10,128. If that were done, you do not think it would be necessary to have them painted on the sails?—No, I think not.

10,829. Could you ascertain the number of a boat a mile off?—Yes, if it was properly painted on the bow and kept fresh painted.

10,830. (*Professor Huxley.*) Do you consider that your instructions oblige you to look after the size of the trawl beam or the mesh of the net?—When I first came up from Yarmouth and was stationed at Torbay we were required to go and look after them. But I think all that has dropped off now, and no notice is taken of them.

10,831. Was that in consequence of any definite orders from your superiors, or not?—No.

10,832. It simply dropped as a custom?—Yes, but we have very little to do with that. The Customs generally look after the beams.

10,833. You are in the Coastguard?—Yes.

10,834. Do the Customs generally look after the beams?—Yes, but it has dropped off gradually. I think no notice is taken now.

10,835. Are you obliged to make any report, stating whether you have examined the nets and beams?—No, we have not done so lately.

10,836. Suppose any person were to state to you that the beams of the trawl-boats here are all illegal, would you feel bound to inquire into the matter?—Yes, I should try to find out what Act it came under.

10,837. But you would not feel compelled to take any notice of it unless your attention was called to it?—No.

10,838. Would you report the circumstance to the Customs?—Yes, to the shipping master who is the collector of Customs.

10,839. But that has never been done?—No.

The witness withdrew.

J. Mitchell.

JOHN MITCHELL called and examined.

10,840. (*Mr. Caird.*) You are in the Coastguard?—I am.

10,841. Where is your station?—At Ramsgate.

10,842. Are you familiar with the different modes of fishing practised here?—Yes, I was brought up a fisherman.

10,843. Have you yourself practised line-fishing and trawl-fishing?—Yes, I served my time to line-fishing in the North Sea.

10,844. Are you familiar also with trawl-fishing?—Yes.

10,845. How long is it since you gave up the business of a line fisherman?—Nearly 30 years.

10,846. Can you tell us from your experience whether the quantity of fish caught now has increased or diminished compared with what it was then?—I am satisfied that there are a greater number of trawlers fishing now than in my time.

10,847. There is no doubt about that?—I am satisfied that they are three to one in number.

10,848. Do you think that each trawl-vessel catches as much fish?—They catch more. I have been in the habit of going aboard to get a mess of fish for a fry, and I know that they never had such quantities then as they have now.

10,849. Do you speak of the quantity they have had this year?—I will take the last 10 years.

10,850. Then within your knowledge there has been a gradual increase?—Yes.

10,851. Although the number of vessels has increased the take of each vessel has also been greater?—Yes, much greater than formerly.

10,852. Then the increase of fish to the general markets of the country must have been very great?—Yes, and it is gradually increasing.

10,853. Do you say that the greater the number of vessels the greater the quantity of fish?—Yes.

10,854. Do you think that the more the sea is fished the greater quantity of fish there is caught?—Yes, I think they go to different spots in great numbers. The fishing boats now go and seek grounds they never thought of going to at one time. There are a much greater number of grounds now fished on than the boats were in the habit of going to before.

10,855. You say that you have been in the habit of going on board trawl-vessels. Have you been on board of them lately?—Yes.

10,856. But you have not been on the fishing grounds lately?—No.

10,857. Have you ever seen a trawl hauled on board?—Some years ago I saw it.

10,858. Did you observe whether there were any dead or mangled fish?—There were very few indeed. Perhaps one might get partially through the net, and being unable to get right through it would be dragged over the ground with the weight of fish upon it.

10,859. But that would be an exceptional case?—Yes, there would only be one or two that would be injured in that way.

10,860. Did you notice any dead fish?—No.

10,861. Have you ever observed, in looking over a a trawl-boat now, that it brings any mangled fish ashore?—I never saw any.

10,862. Nor any unfit for the market?—No, unless

they have been caught in a calm and in the summer time. Then I have seen such little things as gurnets that would be worse for wear owing to the length of time they had been kept.

10,863. Have you noticed in the trawl-fishing inshore lately whether any large number of immature fish are caught ?—No.

10,864. Is there any mode of fishing practised on this coast that is destructive to young fish ?—Yes.

10,865. What is it ?—I think the shrimping causes great destruction. The nets of the stow-boats also destroy a great quantity.

10,866. Does shrimping destroy a great quantity ?—Yes, but nothing like the quantity destroyed by the nets of the stow-boats.

10,867. Is there much destroyed by shrimping ?—Yes, according to the nets they use.

10,868. Does that take place at any particular season of the year ?—In the summer season.

10,869. Is it only in the summer season that small fish are destroyed by the shrimp nets ?—It is more in the summer than in the winter.

10,870. Are the fish destroyed ; are they dead ?—They are of no size. They are not bigger than a halfpenny piece.

10,871. Are they thrown on the shore ?—There may be a part thrown over, but they are so tender that handling them kills them.

10,872. You say that that is not the most destructive mode of fishing ?—No.

10,873. What is the most destructive mode ?—The stow-boat fishing.

10,874. What is that ?—Some hundreds of vessels come down fishing in the Swin and in the mouth of the London river for sprats. They catch tens and hundreds of thousands. They use them for manure.

10,875–6. Do they fish for them ?—They fish for sprats, but hundreds of thousands of small fish get into the nets, the meshes being so small.

10,877. The sprats are very small themselves ?—Yes.

10,878. Then they must necessarily be caught by a small mesh ?—They might be caught by a drift-net.

10,879. A drift-net like a herring-net ?—Yes, with a smaller mesh. If they had a drift-net the small fish could pass through, but the stow-boat net is similar to a trawl. The meshes are drawn close, and a great quantity of small fish are enclosed in the net. They cannot get through the mesh, although if it was properly open they would be able to do so.

10,880. How long does the stow-boat fishing last ?—About three months. They begin about November.

10,881. Then they fish during November, December, and January ?—Yes, that is about it.

10,882. What kind of fish do they catch other than sprats ?—Various kinds of fish, such as brill and turbot not bigger than a halfpenny piece ; they also get whitings and some fish that you can hardly tell what they are.

10,883. Has your attention been much directed to the stow-boat fishing ?—I have often seen it, and I have remarked the destruction it causes.

10,884. Has it been practised for many years ?—Yes, but it is practised more now than it was 30 years ago.

10,885. Is the number of stow-boats increasing ?—Yes.

10,886. Could they not make more by sending the fish to market than by selling it for manure ?—They are not big enough to sell for food. Perhaps they may take the larger ones and sell them with the sprats.

10,887. Are the small fish all sold for manure ?—Yes, they are not fit for anything else.

10,888. Is there a large quantity sold for manure ?—Yes, there is a large quantity sold on the coast of Essex and in the London river.

10,889. Can you tell us any particular place where it is sold for manure ?—It is sold all up the London river and on the Essex coast. It is sold at Faversham and along the Essex coast right up the Thames.

10,890. Do you think much damage is done by that destructive mode of fishing ?—I think there is a wonderful sight of damage done.

10,891. Then how does it show itself, when you say that the catch of fish in the deep sea has not diminished ?—That I cannot account for ; but I think our coast is quite large enough to produce fish for the whole population of the country providing the breed is not destroyed.

10,892. Do you think the breed is to a certain extent destroyed ?—I do.

10,893. Do you think if this stow-boat fishing were put a stop to that there would be a larger quantity of fish ? —I do.

10,894. Could any regulation be adopted by which the stow-boats could be prevented from catching these small fish, and yet be enabled to catch those that are fit for food ?—Yes, I think it would be no loss to the public at large if the sprats were caught by drift-nets, the same as they are on this coast.

10,895. Would they catch as many ?—I don't think they would, but they would catch a great many.

10,896. Should the drift-nets have a certain specified size of mesh ?—Yes ; there are a great many parts where they do nothing but drift for them.

10,897. These stow-boat nets do not drift like the others, and the small fish can't get out ?—Yes ; they are drawn at their anchor. The mouth is open, and the tide runs all kinds of fish into them.

10,898. Then the fish are not meshed?—No, they are caught in a body. Sometimes they get so large a quantity that they cannot haul their net in. They will cut part of the net and draw the fish in and then fasten it together again.

10,899. Could they not catch such large quantities with the drift-net ?—They generally catch what we call "smig" of all sorts.

10,900. You say that the trawl-fishing has not diminished ?—No, there are a great number of fishermen ; they use greater exertion and they get larger quantities of fish ; but still I am satisfied that there is a great quantity of fish destroyed by the stow-boats.

10,901. Is there any other mode of fishing that you consider injurious ?—I know of no other.

10,902. (*Professor Huxley.*) Were you in the habit of fishing in your younger days off this coast for haddock ?—I have fished for haddock on the Scotch coast, and on the shoal grounds, and away by the Silver Pits.

10,903. Do you suppose that all the breeds of fish grow up to be full-sized fish ?—No ; I think the fish are cannibals, and live upon each other.

10,904. Then it does not follow that if the fishermen were not to catch young fish they would all grow up until they became full-sized fish ?—No, but they would supply food for the others.

10,905. They would feed the dog-fish, would they not ?—They might.

10,906. The dog-fish are not eaten, are they ?—We used to eat our cod livers when I was in the cod fishery, and I have heard it said that the liver of the dog-fish is quite as good.

10,907. A great many of the breed will be eaten by haddocks and other fish ?—Yes.

10,908. Are you at all acquainted with the fishery for whitebait ?—No, I know nothing of the catch of whitebait.

The witness withdrew.

Joseph Hennessy called and examined.

10,909. (*Mr. Caird.*) Are you in the Coastguard ?—Yes.

10,910. Are you stationed at Pegwell ?—Yes.

10,911. Have you observed the mode of fishing carried on there ?—Yes, the shrimping.

10,912. Is shrimping the only fishing carried on in

RAMSGATE.

J. Hennessy.

17 Oct. 1863.

Pegwell Bay?—Yes, except the fishing with small nets made fast to stakes. They catch a little flat-fish, plaice, and occasionally a mullet in that way.

10,913. With small nets made fast to stakes?—Yes, to stakes driven down in the sand, with about four or five feet left above. They catch small plaice, and occasionally mullets.

10,914. Do they catch much fish?—I have never seen much caught. They get about half a bushel sometimes.

10,915. Are the fish they catch in that way too small to send to the market?—No.

10,916. Does not that kind of net catch small fish?—No.

10,917. Is much destruction of small fish occasioned by the use of the shrimp net?—The greater part of the small fish they catch in the shrimp nets they heave overboard again.

10,918. They heave them into the sea?—Yes.

10,919. Is there a large quantity of small fish caught in that way by the shrimp net?—I have had no personal experience in the matter, but I have been told so. They say that they heave the greater part of them into the sea again. I never observed a shrimper bring up more than a dozen small fish, more or less, and he always throws them back again.

10,920. Do you think that the quantity of small fish caught by the shrimpers is large enough to injure the fishing here?—The quantity they catch certainly diminishes the brood, but there is no large extent of small fish caught.

10,921. The quantity caught is immaterial in regard to the general supply of fish throughout the year?—I believe so.

The witness withdrew.

J. Livick.

JAMES LIVICK called and examined.

10,922. (*Mr. Caird.*) You are, I believe, the superintendent of the police here?—Yes.

10,923. Have you been long in that position?—Nearly 24 years.

10,924. During the time you have held that office have you had many complaints made by the fishermen with regard to damage done to their nets or lines, or have you heard any complaint made against the trawlers for infringing any of the regulations laid down for fishing?—I have had a few complaints made by the mackerell and herring fishermen.

10,925. What has been the nature of their complaints?—They have complained that their nets have been destroyed by the trawlers.

10,926. Have there been many such complaints?—We have had very few convictions.

10,927. Have the complaints been inquired into and investigated?—Yes, they have been inquired into.

10,928. And has there not been sufficient evidence to justify a conviction?—There may have been one or two convictions. The last case we had, as far as I recollect, was in consequence of the number on the sail of the vessel having been obliterated or covered over with canvas. That was a case that occurred off the coast of Margate.

10,929. Was it a case in which a trawler was charged with having fouled nets?—Yes.

10,930. And the vessel could not be identified in consequence of the want of the number?—Yes, that was so.

10,931-2. Had she her number on her bows?—She had, I believe. The net men complained that she had no number on the sail.

10,933. Did he state whether any means had been taken by the trawlers to prevent the number of the boat being seen?—He said there was a piece of canvas over it.

10,934. Why did not the fishermen take means for ascertaining whether the number was not on the bow of the vessel?—I cannot say. They said they looked for the number on the sail, and could not find it. That is the only case in which, under such circumstances, it was found impossible to convict.

10,935. Have there been many convictions?—No, very few.

10,936. Have there been any this year?—No, none. We have had a conviction against a French fisherman for fishing within the limits, but that was not with a trawl.

10,937. Was that this year?—Yes; he was a long-line fisherman. Last year there was a similar conviction.

10,938. Was the offence committed off this coast?—Yes.

10,939. Who brought in the Frenchman?—Upon one occasion the boat was brought in by the Revenue cutter.

10,940. Was a fine inflicted?—Yes, upon each occasion a fine of 5*l.* was inflicted.

10,941. Was the particular act complained of that the vessel was fishing within the limits?—Yes, within three miles of the coast.

10,942. Not that the men were doing any other damage?—No; they were only fishing within the limits.

10,943. They were not trawl-fishing?—No, they were not trawl fishing. The mackerel and herring fishermen complain, the mackerel fishermen more especially, that there is very much damage done by the trawl fishermen. I remember one of them saying to the justices here "If we could only have six hours "we should do our work. If they would keep "away from us for six hours, we should ask for no "more but as it is, we are constantly hampered by "them."

10,944. (*Professor Huxley.*) Do you suppose that the mackerel fishermen here are not acquainted with the state of the laws, as laid down in the regulation I read just now, and which applies to the mackerel fishermen as well as to the herring fishermen, namely, that "trawl-boats shall always keep at a distance of "at least three miles from all boats fishing for herring "or mackerel with drift-nets?"—They did not appear to be acquainted with it.

10,945. Suppose that a herring fisherman or a mackerel fisherman were to make a complaint that he had been interfered with by a trawl-boat, now that you are acquainted with the provisions of this Act, would you feel bound to act upon it?—I should recommend him to take out a summons against the parties.

10,946. Do you conceive that anybody is competent to lay an information under the Act?—I cannot say; I have not looked at the Act.

10,947. Have you ever known any information laid except by an officer of the Customs?—Not as far as regards the distance within which foreign boats have been fishing.

10,948. But as far as regards other matters?—As far as regards other matters the parties have complained themselves.

10,949. Has any complaint been made as to the size of the beam or the mesh, or with regard to the head irons not being of a proper weight?—No.

10,950. You have had nothing of that kind?—No.

10,951. The complaints you have had have all arisen from actual damage done?—Yes, that is all. It appears to me that the fishermen do not think of the regulations unless they suffer damage.

10,952. The only complaint made by the officer of Customs here has been with regard to an infringement of the limit within which foreign vessels are allowed to fish?—Yes.

10,953. They have never laid any complaint against the trawlers respecting the size of the mesh or the size of the beam?—No.

The witness withdrew.

RAMSGATE.

P. Bartlett.

17 Oct. 1863.

PHILIP BARTLETT recalled.

10,954. (*Mr. Caird.*) You wish to add something to the evidence you have already given?—Yes; it appears to me that the inspector of police here has been making some remarks respecting the magistrates not convicting the trawlers for damaging drift-nets. Now I think that if the case had been justly represented and the trawlers had been confined as prisoners on that occasion they ought to have had compensation for their imprisonment. It is the drift-net men and not the trawlers who are to blame. For instance, if you will go down to the pier you will see a number of drift-net boats, and I will point out to you that they carry no proper lights. The light they carry is only one on a grating. It is all very well for the inspector here to bring these matters before this court of inquiry, but it becomes me as a ground-fisherman to protect myself. I do not find that he has spoken a word in reference to the lights carried by the drift-net boats.

10,955. (*Professor Huxley.*) But if the drift fishermen do wrong that is no justification for your doing wrong also?—No; but I have every reason to believe that the ground-fishermen would go three or four miles away from the drift-net boats if they carried proper lights.

10,956. (*Mr. Caird.*) It is not that you have any wish to get foul of the herring men, but that they do not carry the lights they ought to carry?—That is the point of view in which I look at the matter. If you will go down with me to the pier I will show you the drift-boats, and you will find that they have only one grating to put a small light on.

10,957. Don't they hoist lights on the mast?—No; because the foremast is lowered down. The mizen-mast is also put down, and then a grating is erected, and on one side of the boat you would not discern the light at all, because it is below the hoist of the sail. It is all very well for these drift men to come here and say "we had a light up," but according to the Act of Parliament they must show two lights. You may as well have no light at all if you only set it under a bushel. If the Commissioners go down to examine the drift-boats you will find that my statement is quite correct. Now if my boats fall into an error next Monday of Tuesday and get foul of the herring boats they will all swear that they had their lights up.

10,958. (*Professor Huxley.*) I will read the article again, it is this: "In order that boats fishing with drift-"nets may be easily recognized at night, the masters "of these boats shall hoist on one of their masts two "lights, one over the other, three feet apart. These "lights shall be kept up during all the time their nets "shall be in the sea between sunset and sunrise." The next article says: "All fishermen are forbidden, except "in cases of absolute necessity, to show lights under "any other circumstances than those mentioned in the "present regulations." Those are the two articles I read. As I understand your argument it is this: that in the first place the herring boats do not carry the two lights they ought to have, and that the light they do carry is placed where it ought not to be placed, and that therefore they have no right to complain?—Certainly. Two years ago when I was at sea there was a report here of a vessel being stranded, and of a great quantity of tallow being afloat. I took my vessel and proceeded to sea with her. I spoke to three drift-boats, and their lights were all in the position I have represented. I spoke to them in order to ascertain if they had seen anything of the drift tallow. They had none but the square light. I can show you as a fact that there are no less than 15 boats in the harbour, every one of which is rigged on that principle. Surely if they go fishing with insufficient lights and fall foul of a trawler, he should not be made to suffer for it.

10,959. (*Mr. Caird.*) What regulations are there as to the lights of a trawler?—We are bound by the regulations issued by the Board of Trade to carry particular lights. Every one of the fishermen belonging to this port belongs to a society—an incorporated mutual fishing society. As soon as one of our nets is overboard we are bound to exhibit a globe light reflecting the horizon. We are supposed to be stationary when the fishing gear is overboard, as we should be if we had our anchor down. We exhibit a light of that description, and if the herring boats will not exhibit the two lights they are bound to show, and have only a galley or a grating in which they put a square light, then if my vessel gets foul of their nets they ought not to be allowed to come here and sue me, and swear that they had their two lights up when it was only possible for them to put up one.

10,960. They would be obliged to prove that they had proper lights exhibited?—Yes; but they will say, in the first instance, that we were at fault, because we were bound to keep three miles from them.

10,961. The magistrates would not inflict a penalty unless they found that all the conditions were fulfilled by the person complaining?—Unfortunately, the strongest are sure to get the day, and they are stronger than we are; in addition to which, if they lose, the Fishing Society pays the damages.

10,962. Referring to what you stated previously with regard to the injury done by painting the number of the vessel upon the sail, do you think there is any part of the sail upon which the number could be painted with less injury to the sail?—Yes, it might be painted upon the throat.

10,963. You would prefer having the number placed near the throat of the sail?—Yes; unless we were exempted from numbering the sails altogether.

10,964. That would be quite as conspicuous as the the numbers in their present position?—Yes.

10,965. You would prefer to have them there rather than on any other part of the sail?—Yes.

10,966. Because, in your opinion, there is less pressure of wind there than upon any other part of the sail?—Yes.

The witness withdrew.

(*Mr. Caird.*) Is there any drift-net fisherman present who desires to offer us evidence?

J. W. Arnold.

JOHN WILLIAM ARNOLD examined.

10,967. (*Mr. Caird.*) You are a drift-net fisherman?—I am a Trinity House Pilot at present, but I have been a drift-net fisherman since I was nine years old.

10,968. From Deal?—From Deal, Walmer, and Kingsdown. They are all included in one port.

10,969. What season of the year do you practise drift-net fishing?—The mackerel season is from the beginning of May to the end of July, and the herring season from the beginning of October to the end of November.

10,970. And during the rest of the year what business do you follow?—The sprat business, and the cop line business in the winter time.

10,971. Is that hand-line fishing?—No, the long-lining.

10,972. You have been a trawl fisherman?—No, I never have.

10,973–4. Do you follow the line-fishing on the same grounds that the trawlers frequent?—Not from our port. We do not go as far to sea. We practise the line-fishing inside.

10,975. What is the length of your lines?—We have 20 sail of small boats, that hail from Kingsdown and Walmer, and they shoot lines about 2,000 feet long.

10,976. Have you found that the fish has been increasing or diminishing?—We find them diminishing, the codfish especially.

RAMSGATE.

J. W. Arnold.

17 Oct. 1863.

10,977. Is the number of boats increasing or diminishing?—The number of boats is about the same as it was years ago.

10,978. And the number of men employed in the fishing?—About the same.

10,979. Do they frequent the same ground they fished on in former times?—Just the same.

10,980. Do you think that the average quantity of fish brought ashore is less than it used to be?—I think it is.

10,981. Particularly with regard to the cod?—Yes, the cod particularly.

10,982. Has there been any difference in the quality?—No, the quality of the few that are caught is about of the same standard that it was formerly.

10,983. What depth of water do you fish in?—The lines are shot in from 8 to 12 or 14 fathoms of water.

10,984. When did you first begin to notice the falling off?—There has been a falling off during the last 10 or 12 years.

10,985. Do not the fishermen make as good a business of it as they did formerly?—Not in the cod-fishing.

10,986. Putting all the fishing together, do they make as good a business of it?—Not the drift-net fishing, and if something is not done by the Government as far as the drift-net fishing is concerned they must abandon it altogether. The mackerel season produces very little now, and it will continue so while they allow the stow-boats and the trawlers to go into the bays.

10,987. Do the trawlers catch mackerel?—No, but they disturb the fish. I think the existing laws would prevent any evil if they were carried out. I think they are quite sufficient to answer every purpose.

10,988. Do you think that the trawl-boats should be excluded from the shallow waters?—Yes, I think so.

10,989. Are the mackerel disturbed in the shallow waters?—They are. In the month of May there are great quantities of mackerel in Rye Bay, but the trawl-boats are among them all day long to the great injury of the fishery. I think it is well known that these fish go in there to spawn.

10,990. You are of opinion that if the regulations contained in the Act of Parliament were enforced they would do good?—Yes, I think they would answer every purpose.

10,991. Have you found that the take of mackerel has decreased?—Yes, very much; and I am afraid we shall have to abandon the mackerel-fishing altogether unless some alteration is made.

10,992. When did the mackerel-fishing begin to decrease perceptibly?—Within the last seven years. The mackerel have been rapidly declining every season within the last seven years.

10,993. How many boats have you?—There are 35 large boats from Dover, Walmer, and Kingsdown, and 12 sail of small luggers.

10,994. Within the last seven years has the number increased or diminished?—They are about the same. There are no more and no less.

10,995. Are they not making as good a business of it now?—Not nearly as good as they did formerly.

10,996. They are not catching as many fish?—Not nearly so many.

10,997. You do not think that that is because the trawl-vessels destroy the fish, but because they disturb them?—I believe they disturb them in the summer time. They would not do any harm in the deep sea. I think the trawlers ought to be kept out of the way for a mile or two from headland to headland. They should be kept out there during the months of May, June, and July, and from all the grounds where the drift-net fishing is carried on. They should also be kept out in October and November when the herring season is on. A great deal of damage is done to the drift-nets, not by the English trawlers, because they know pretty well what to do with the drift-nets when they come athwart them.

10,998. When does the herring fishery begin with you?—In October, about this time.

10,999. Do you find herring also in the same limits?—Yes, in the same limits.

11,000. Within a distance of three miles from the shore?—Yes, I have seen them close in here at the mouth of the harbour.

11,001. Is the largest quantity you get caught within the three-mile limit?—Some seasons that has been so, but at other times the largest quantities we have got have been caught 12 or 14 miles from the land off the North Foreland.

11,002. In what way do the trawl-boats disturb the herrings?—I don't think the trawl-boats here disturb the herrings, but the fishermen by trawling among them injure the fishery. When the fishery is on you will perhaps have a fleet of drift-nets overboard which cost 150*l*. That is an immense lot of property to have there running the risk of being destroyed.

11,003. How many sail of herring boats are there fishing there at one time?—I have seen 150 from this harbour, and if the trawlers get amongst them they will cause 100*l*. worth of damage in a very few hours. I do not think that the English trawlers do much damage; when they find that they are in among the drift-net fishermen they heave their trawls up and go away. It is the French trawling vessels of which we complain most, we have the most trouble with them, they trawl through everything; they don't care for anybody's gear, and they make a pretty mess of us sometimes.

11,004. Does anybody interfere?—No; if our pilots send off for a man-of-war to keep them out, before the admiralty boat can get there a telegraphic message is sent across to Boulogne, and none of their boats come here that night.

11,005. Is that the only protection you have had?—We have petitioned the Admiralty for many years, but they generally send down their boats too late; there has always been a great deal of damage done before a boat has been sent in, but whenever we have had protection everything has gone on right.

11,006. Has much damage been done to your nets in that way?—Some hundreds of pounds worth are destroyed in a night every year; drift nets are very expensive things.

11,007. Are the shoals of herrings that come off here as large as they were formerly?—Sometimes I think the herrings are quite as thick as ever they were at certain seasons; some seasons there will be less than at others.

11,008. Generally speaking you have not observed any diminution in them?—No.

11,009. But with regard to mackerel you think there has been a diminution?—Yes, there has been a decided decrease in the quantity.

11,010. And also in your line-fishing?—Yes, and in the line-fishing as well.

11,011. To what do you attribute the decrease in the line-fishing?—I hardly know what the cause of it is except it is that the small fish are disturbed so near the coast in the summer time.

11,012. Do you mean by trawling in-shore?—Yes. In Rye Bay and Hythe Bay I have seen sometimes 50 sail of French boats right in along the shore close into Dungeness; they come in so thick that as soon as a fish pokes his head out of the sand he is raked up at once, and it does not matter how small he is.

11,013. Is that within the three-mile limit?—Yes, sometimes within one mile; you might almost stand on Dungeness Point and stone them, they are as close in as that.

11,014. Is there any other mode of fishing practised in the part you come from?—Yes, we catch large quantities of sprats with the drift-nets.

11,015. Do you use the drift-net for that?—Yes.

11,016. You do not use the stow-nets?—No.

11,017. Do you catch any small fish in your drift sprat nets?—No, they all go through, we only catch the large ones; our sprats are always worth more in the market than those caught at other places, but we have such large quantities of them sometimes that we are obliged to sell them for manure.

11,018. Is sprat-fishing profitable here?—Yes.

11,019. Is the sprat-fishing or the herring-fishing most practised here?—I think that at Deal, Walmer, and Kingsdown the sprat-fishing yields as much as the herring-fishing.

11,020. Does the quantity of sprats continue pretty much the same?—About the same.

11,021. The shoals come in in about the same strength as formerly?—Yes.

11,022. They do not seem to have been disturbed?—No.

11,023–5. What is the size of your sprat-nets?—The mesh of the sprat-net is the size of a shilling; it is the same for two knots as a shilling; a shilling ought to be between the two knots, it ought to pass through the mesh. An inch mesh is the mesh of the herring-nets.

11,026. Are you quite sure that you are correct when you state that a shilling will go through the mesh of your sprat net?—Yes, it ought to go through.

11,027. Is it as large as that? (*producing a net*)—Yes, and a halfpenny ought to go through a herring net from knot to knot.

11,028. (*Professor Huxley.*) When you go out herring-fishing how do you light your vessel?—How do we light our vessel?

11,029. Yes?—Where the step of the foremast is we generally stick up a spar about 10 feet long and display a light from that, and another light abaft, so that anybody coming end on to us would see the light at the fore highest, and the light aft lowest.

11,030. Do you think that that is a legal mode of lighting the vessel?—I think so.

11,031. This is the regulation: "In order that "boats fishing with drift-nets may be easily recog-"nized at night, the masters of these boats shall hoist "on one of their masts two lights, one over the other, "three feet apart. These lights shall be kept up "during all the time their nets shall be in the sea "between sunset and sunrise."—The way in which our boats are lighted generally answers the same purpose.

11,032. I am not speaking about that. I am telling you what the law is. Does anyone interfere with the mode in which your boats are lighted?—No, nobody interferes with us.

11,033–4. Nobody ever examines your nets either?—No; but in that respect we keep to the regulations pretty strictly ourselves.

11,035. What is the size of the herring nets which you use?—An inch from knot to knot.

11,036. Are your boats decked or undecked boats?—They are partly decked.

11,037. They are not completely decked?—No, only partly decked. They are built in that manner at Deal, Walmer, and Kingsdown.

11,038. Do you ever set your nets for taking herrings? Do you ever anchor them?—Never.

11,039. Are the mackerel nets made after the same fashion as the herring nets?—Yes, only they are larger.

11,040. What is the size of the nets?—I think about $1\frac{1}{4}$ inch from knot to knot.

11,041. Does anybody ever examine them?—I don't know?—I never had anybody to examine them.

11,042. Have you ever heard of any law with regard to that?—Yes; I have read the Convention all through, especially with reference to the trawlers.

11,043. Is the lower part of the mackerel net loaded, I mean the foot rope?—Never.

11,044. At what time do you consider that the herrings are full fish?—In the month of October. They are never better here than when they are caught then.

11,045. They are full then?—Yes.

11,046. Full of spawn?—Yes, they generally lose their spawn about the beginning of November.

11,047. When are sprats full?—About Christmas time, about the month of December.

11,048. Do they lose their spawn after that?—Yes.

11,049. Do you get any herrings here in January?—No.

11,050. Do you ever see the appearance of herrings then?—Not in January.

11,051. Are there none in the spring months?—Very few. Sometimes the boats may catch a few hundreds.

11,052. Are there none in August?—I have seen some fat herrings caught in August in the drift-nets.

11,053. Fat, not full?—No.

11,054. What is the average length of the herrings you catch here?—They will reach about 13 inches.

11,055. What time of the year do the mackerel spawn?—About the middle of June they begin to go, and from that up to the beginning of July.

11,056. In what depth of water do they spawn?—I I don't know that there is any regulation. Some spawn in-shore, and some off the shore, all round about the coast. I think the stow-boats are the greatest drawback to the mackerel.

11,057. Why do you think so?—Because they catch all the little fish, and do not allow them to come to maturity. They catch the spawn of the herring too after the herring spawn is partly matured. I think one half of it is caught in that manner by the stow-boat nets at the estuary of the Thames. We have got a great number of stow-boats fishing here occasionally. They pick out the sprats, and send them to the market, and all the rest of the smig they sell for manure to put on the land.

11,058. Do they fish here?—Not exactly here, but in the Black Deeps, the Swin, and up the Channel.

11,059. Do they hail from Margate?—There may be some there, but they mostly come from Whitstable, Faversham, Harwich, and Ipswich. It is a crying nuisance, and ought to be put a stop to.

11,060. (*Mr Caird.*) Could the stow-boats fish equally well with drift-nets?—I think so. Some of them do at Margate. They have knocked off the stow-boat fishing there.

11,061. Did they make that change themselves?—Yes.

11,062. Did they do so because they found it would be to their advantage?—Yes.

11,063. Do they catch more marketable fish in consequence?—Yes, and they are sold at a better price.

11,064. They gave up catching fish for manure?—Yes.

11,065. How long is that ago?—About eight or nine years.

11,066. Has that had any effect upon the quantity of fish caught at Margate?—Yes; there have been more sprats caught there since they adopted the drift-net fishing than were caught formerly.

11,067. Was there anything in the shape of the boat that necessitated a change of the net?—They would be required to change their boats.

11,068. Then a change of that sort must have been attended by a considerable sacrifice of capital?—It would involve some expense, but not a great deal.

11,069. Can they use the stow-boats for any other fishing?—Many of the small ones will be of service. I don't think the larger ones would do for drift-nets, but the smaller ones would.

11,070. You say that the Margate people have changed their boats?—Yes, from the smacks they used to have and luggers to small punts 20 feet long.

11,071. Do you get any herring in your sprat nets?—Very seldom. You catch one now and then, but not often.

11,072. Are they not caught at the same season?—In the latter part of the herring season you may catch a lot of sprats. When the herrings get to be shotten they come in. About Lord Mayor's day we expect to get the first lot of sprats.

11,073. They do not come together with the herring?—No; it is very seldom that you catch any during the herring season.

RAMSGATE.

Robert Cook examined.

R. Cook.

17 Oct. 1863.

11,074. (*Mr. Caird.*) You wish to make some remark upon the evidence of the last witness?—Yes, with regard to his hook fishery within a short distance of the coast. I have practised that, and I have hauled fish by the hook-and-line as fast as I could bait the hooks, but let a steamboat come near you and you may haul your anchor up and you may go home, for you will catch no more. I think that steam on the water does a great injury.

11,075. Do you mean that one reason why the line-fishing has fallen off is the number of steam vessels now running?—Yes, passing and repassing. I have been catching whiting off the North Foreland, within a short distance of the coast, and have been heaving them up as fast as I could bait the hooks, but let a steamboat pass me, and I should catch no more.

11,076. Where would you move to in that case?—I should go home.

11,077. Did the fish disappear altogether?—No; the next day on the same spot you would catch the same number until another steamboat came opposite. And at that time the steamboats were not half so plentiful as they are now.

The witness withdrew.

P. Bartlett.

Philip Bartlett recalled.

11,078. (*Mr. Caird.*) Are you desirous of making any further statement?—With regard to the failure of the mackerel season during the last five years, I think it has been in consequence of the long continuation of calms. When there is not much wind a man is as well in the harbour with his nets on board as at sea. Mackerel is a spurt fish that requires plenty of wind and water. There has been more mackerel this last season at Rye Bay and Hythe Bay than was ever known. I was in Hastings in the month of June when there was such an abundance of mackerel that they had their nets set on shore at low water mark. They put stakes in the sands and attached nets to them; one man if he could have saved his haul would have got five lasts of mackerel, and there was a continuation of that nearly the whole length of the season. The cause of that was the previous long continuation of calms. The fish struck in-shore and there was no commotion to drive them out. They laid there till they became unsaleable and unfit to eat. Yet there is a Trinity-house pilot who hardly knows what a mackerel is, who says that the trawlers disturb them. Why there were more last season than the Great Eastern could have carried away. They were so numerous that they sold for 8*d.* a hundred.

The witness withdrew.

The inquiry was then adjourned until Monday, November 16, at Yarmouth.

Great Yarmouth, Norfolk, 16th November 1863.

Present:

GREAT YARMOUTH.

James Caird, Esq., M.P. (Chairman).
G. Shaw Lefevre, Esq., M.P.
Professor Huxley, F.R.S.

S. Hewett.

16 Nov. 1863.

Samuel Hewett called and examined.

11,079. (*Mr. Caird.*) Mr. Hewett, have you been long connected with the fishing interest here?—Not here; I have only been eighteen months here myself, but I have had a few vessels here for the last eight or nine years.

11,080. Are you acquainted with the modes of fishing practised here and with the supply of fish brought to Yarmouth?—Yes.

11,081. What are the different modes of fishing practised at Yarmouth?—Trawling. There are also drivers for herring and mackerel.

11,082. Has Yarmouth been long famous as a fishing place?—Yes, for herring and mackerel.

11,083. But has it not long been famous as a trawling place?—Trawling has only been carried on here for about 20 years.

11,084. Was it a line-fishing place previously to the trawl-vessels coming here?—No, it was never a line-fishing place.

11,085. Then with regard to the white-fishing at Yarmouth does it date its origin from 20 years ago when the trawl-vessels first came here?—I was not speaking of the white-fishing but of the line-fishing at Yarmouth.

11,086. Was there any white-fishing carried on at Yarmouth before the trawl-vessels came here?—There was very little white-fishing before then.

11,087. How many trawl-vessels hail from Yarmouth now?—I believe there are more than 100 that hail from Yarmouth. Our vessels hail from London, but there are more than 100 that hail from Yarmouth. I don't know the exact number.

11,088. How many trawl-vessels altogether frequent the port of Yarmouth, including those which hail from Yarmouth and those which hail from London?—Perhaps there will be about 150.

11,089. One hundred and fifty altogether?—Yes, but I don't know the exact number.

11,090. Do you know whether that number has increased much within recent years?—Yes, it has increased very much; it increases now every year.

11,091. Can you give us any specific facts upon that point?—No, but I am positive that is a correct statement with regard to the trawl-vessels generally. There were only four or five belonging to the town 17 or 18 years ago, and now there are 150, or perhaps more than that.

11,092. Has that increase taken place principally within recent years?—Yes.

11,093. How many years ago is it since the greatest increase took place?—About eight or ten years ago the number began to increase very fast.

11,094. From four or five, did it jump up all at once to a considerable number?—It has been increasing very fast ever since.

11,095. It has been increasing ever since up to the present day?—Yes.

11,096. Do you remember how many there were five years ago?—No, I do not.

11,097. Has the size of the vessels increased as well as the number?—Yes, the vessels are larger now than they were 20 years ago.

11,098. Are they manned by the same number of men?—No, they are manned by more men.

11,099. Are the nets they carry larger?—Yes, the nets are larger.

11,100. What is the average size of the trawl-vessels fishing from Yarmouth now?—By the new measurement the size of the trawl-vessels will run from 30 to 50 tons. By the old measurement some would be as high as 60 tons. Between 50 and 60 tons the principal part of them would be.

11,101. What number of men do they carry?—Six or seven hands including men and boys.

11,102. How many men and how many boys?—Our own London vessels take more men than those at

Yarmouth. We take seven or eight; three men besides the master, and three or four boys.

11,103. Are those boys apprenticed?—Yes.

11,104. They are regularly indentured to you?—Yes; but I believe that the Yarmouth people do not take any large number of apprentices.

11,105. Do you pay the men and boys by wages, or by share on the fishing?—They are paid wages.

11,106. Do their wages in any degree depend upon the catch of fish?—Very little indeed; sometimes we give them a gift if they make a good voyage. We give them a few shillings by way of gift when they come home.

11,107. Have they no share in the ownership of the vessels; have any of the fishermen an interest in the catch of fish?—Only the captain.

11,108. Has the captain a share?—He receives five per cent. upon the earnings, but he has no share in the vessel itself.

11,109. He has no share?—No; he is only paid a per-centage upon the earnings.

11,110. Turning more particularly to the object of our enquiry, can you tell us whether the supply of fish brought to Yarmouth is increasing, stationary, or diminishing?—It is increasing fast; the supply of fish is increasing very fast, but at the same time the number of boats employed in catching fish is also increasing.

11,111. Can you compare the supply with any previous time, say five years ago?—When you talk of the fish coming ashore at Yarmouth, I know very little about that. All I can say is, that the fish caught by vessels from this port has increased wonderfully, and is still increasing.

11,112. That is the question I wish to put to you?—There was never so much known to be caught as at the present day, or, at any rate, a month ago. Our vessels have been fishing recently upon the Dogger Bank.

11,113. (*Mr. Lefevre.*) Do you land your fish here?—We mostly send it to London.

11,114. (*Mr. Caird.*) You say that you have been fishing recently on the Dogger Bank?—About three weeks ago our vessels were on the Dogger Bank, and they found more fish there than was ever known, or thought of at any previous period. They got over two tons after a two hours' haul. This, gentlemen, is a statement that I have received from four of our captains.

11,115. Do you put in that paper as part of your evidence?—Yes.

11,116. It is a certificate from four of your captains as to their catch during the last season?—Yes, they were going away this morning or they would have been here ready to be examined.

11,117. Do you agree with the statement, and believe it to be correct?—Yes.

The following document was then handed in:—

November 1863.

We, the undersigned, being masters of trawling vessels sailing out of Yarmouth, the youngest of us having followed trawling for 14 years, do state that in our experience we have not known so much fish as there is at this season. Within the last six weeks, while fishing on the Dogger Bank, we have frequently seen from 40 to 60 packages, weighing between two and three tons, taken by a single vessel for a three hours' haul, the most of them being very fine haddocks.

(Signed) William Brown,
Master of the "Enterprise."
George Tidman,
Master of the "Majestic."
Charles Dossett × his mark
Master of the "Choice Witness."
William Atherton,
Master of the "Unity."

11,118. Can you tell us from your own knowledge what is the quantity of fish that is taken on the average by a boat in the course of a week?—Do you mean the weight of fish?

11,119. Yes, the weight of the different kinds of fish taken?—That is all owing to where they may happen to be fishing. The kind of fish caught depends very considerably upon the ground fished upon; the bulk of the catch is generally haddocks, plaice, soles, and turbot.

11,120. You spoke of the Dogger Bank, do your boats chiefly fish upon the Dogger Bank?—They only fish there now and then.

11,121. Do they always get their largest takes on the Dogger Bank?—We never fished there before this year—at any rate, not so far north.

11,122. Your boats never went so far to sea as they have done this year?—No.

11,123. Do you know whether your boats went upon fresh ground that had not previously been fished, when they went to the Dogger?—I believe they did.

11,124. It was ground that had not previously been fished?—I think it has been fished before, but it has never been so well proved as it has been recently.

11,125. Do they get very much more fish on the Dogger Bank than they were in the habit of getting on the banks nearer the shore?—Yes, they get more fish there than was ever known or thought of.

11,126. Were the fish very fine in quality?—Yes, the haddocks were particularly fine.

11,127. Have more vessels gone to the Dogger Bank in consequence of that successful fishing?—The trawlers are a little shy of the weather in the winter time. That is the reason they don't go so much to the Dogger, but I dare say in the course of another year they will go more than they have been in the habit hitherto. About last October twelve months there were two or three vessels from Hull that were lost, and I think that deterred the fishermen from going to that distant ground. It is a long way from here in the latitude of Hartlepool.

11,128. Are there any boats fishing on the Dogger now?—No, not on the Dogger; but I believe there are some fishing at Botany Gut which is the southern end of the Dogger.

11,129. What distance may that be from Yarmouth?—About 80 miles.

11,130. Is that the ground you chiefly frequent?—Yes.

11,131. Is it down at the Silver Pits?—Yes, we trawl about the Silver Pits.

11,132. In what depth of water do you chiefly fish; in what number of fathoms do you put down your nets?—Generally in from 18 to 23 fathoms.

11,133. (*Mr. Lefevre.*) Whereabouts is Botany Gut?—It is at the south of the Pits.

11,134. Southward of the Outer Pits?—To the southwest of the Outer Pits.

11,135. How many boats have you belonging to you?—Between 50 and 60.

11,136. (*Mr. Caird.*) You have between 50 and 60 boats?—Yes, between 50 and 60 including smacks, cutters, carriers, and fishing boats.

11,137. How many people have you employed in the fishing?—I have been here for the last 18 months. The first year I paid more than 20,000*l.* in wages and victuals. Our supplies, such as clothes and stores, come principally from Barking. There is a gentleman now present who had the management of these vessels before I came down here, and I think he will tell you that from 200*l.* to 300*l.* was paid a week in wages alone.

11,138. Is your business carried on by a company?—Yes; there is only one of my sons in it now.

11,139. Is it carried on by yourself and your sons?—No, I am out of it now.

11,140. (*Mr. Lefevre.*) You have retired from business?—Yes.

11,141. (*Mr. Caird.*) You may object to this question, but I wish to know whether upon the whole, with so large an expenditure, you have found the investment a remunerative one?—Yes, I have no reason to complain.

11,142. Is that fact proved by other persons evincing a desire to go into the business?—I don't know; I am unable to tell you.

GREAT YARMOUTH.

S. Hewett.

16 Nov. 1863.

11,143. Are there others following your example?—A very few, I think; very few indeed now.

11,144. Is there any fishing in Yarmouth itself? Are there any natives of Yarmouth who have trawl-vessels and go and fish on their own account?—Yes, there are a few. I expect one here directly. There are a few, I believe.

11,145. Do the captains in your employment rise to become part owners of vessels?—Yes, a great many of them do. It was more so a few years ago than it has been latterly. We had a great many some time ago. There are several of them now at Grimsby. They originally had part shares in vessels and now they have got the whole of them into their possession. There are several of them at Grimsby at this moment and I believe there are also a few of them at Barking.

11,146. When you were fishing off the Dogger with that large fleet of vessels, in what way did you manage to get the fish sent to market?—We took ice to sea with us and took the fish direct to Billingsgate.

11,147. Had you special cutters employed for that purpose?—Yes, we had cutters on purpose.

11,148. Fast sailing cutters?—Yes.

11,149. Cutters carrying ice?—Yes.

11,150. What length of time may elapse occasionally before the fish reaches Billingsgate market? I mean what length of time may they be out at sea after they have been caught?—Sometimes three or four days.

11,151. Being packed in the ice, are they delivered quite fresh?—Yes, always. Sometimes, if the vessel has been out at sea for a week, the fish has been fresh.

11,152. Do the fish caught by the trawl sold in Billingsgate realize as good a price as the fish caught by the line?—They get quite as good a price, except with regard to very large cod fish caught by the line. That fetches more perhaps; but generally fish caught by the trawl sells as well as line-caught fish.

11,153. I asked a little while ago in what proportions are the different kinds of fish caught by your trawl-vessels; I shall be glad if you will give me that information as nearly as you can?—If we are on the Dogger Bank or at the Silver Pits our principal catch is haddocks and plaice.

11,154. In a good day's fishing you fish about six hours with the tide?—No; about four hours.

11,155. In a good day's fishing what will be the average take in weight?—Perhaps about a ton; but it all depends upon the wind and weather. If the weather is calm they get very little fish; if there is a smart breeze they will get a fair catch; but if it blows a heavy gale then they will get none at all.

11,156. Suppose we take the catch at a ton, in what proportion does that ton consist of the different kinds of fish you catch?—There will be about 3 cwt. of soles; perhaps from 10 to 11 or 12 cwt. of haddocks, and the rest will consist of plaice and whitings.

11,157. Do you catch any cod?—Only a few cod and a few turbot.

11,158. A few turbots?—Yes, and a few brill.

11,158*a*. Have you had a long experience of trawl-fishing elsewhere?—Yes.

11,159. Where?—Off the coast of Holland.

11,160. Have you yourself been fishing off the coast of Holland?—Yes.

11,161. Have you been fishing for some years?—Yes.

11,162. How long is that ago?—It will now be nearly 40 years since I was a regular fisherman.

11,163. Forty years since you were yourself fishing?—Yes; since I was fishing myself. I have been a fisherman over 50 years.

11,164. When you were in the habit of fishing off the coast of Holland, was there any particular reason that took you so far away from home? Did you find that you got more fish on the coast of Holland than at home?—It was all owing to the time of the year, and the season at which we were fishing.

11,165. Did you find that the fish changed their place according to the season?—Yes.

11,166. Can you tell us what, in your opinion, was the reason of that?—In cold weather fish go into deep water for warmth. In very severe weather the fish are always taken in deep water. In fine weather they generally get into shoal water, and then the turbots will be within a few inches of the water's edge. We found them in that way on the coast of Holland. I have often seen them there; they always go for warmth.

11,167. Was that in the summer season?—Yes.

11,168. Then in the summer season you went to the coast of Holland?—Yes, but they go there pretty nearly all the year round.

11,169. Did you trawl on that coast?—Yes.

11,169*a*. Were the Dutch fishermen trawling there at the same time?—Yes, they were trawling with us.

11,170. Were the fishermen of any other country trawling there—were there any French fishermen?—No, there were no French fishermen.

11,171. Have the Dutch fishermen long been in the habit of trawling upon that coast?—Yes.

11,172. Did you ever observe that there was any decline in the quantity of fish caught there?—No.

11,173. Did you ever hear any complaint that the fish were being trawled out?—No.

11,174. Are there any fishing banks nearer Yarmouth than the Outer Silver Pits?—Yes.

11,175. Are they frequented by your trawl-vessels?—Yes, but we don't fish as near Yarmouth as the Yarmouth vessels, generally speaking.

11,176. Why do you not fish as near the coast as the Yarmouth vessels?—We are in the habit of going further to sea. Our men are more accustomed to that sort of thing than the Yarmouth boats.

11,177. But surely you must have an object in that?—Yes, we get more fish, and our vessels have as good if not a better chance when they are a long way out at sea of getting into the London market direct. Perhaps they have a better chance than if they were nearer the coast, but that all depends upon the wind and weather.

11,178. They can make as good a run to London although they are a long way further out at sea?—Yes, if they have been hanging southward or eastward they can fetch a long way up.

11,179. When your trawl-vessels go out do they go out in a body altogether, or singly?—That is just as it happens. We have four going away to-day and in all probability they will keep together.

11,180. They will keep pretty close together?—Yes, until they join the fleet.

11,181. When will they begin to put down their trawls?—If it is a fine night they will probably put them down to night. If they think that they can gain anything by it they will certainly put them down to-night.

11,182. Before they do so will they arrive at what they consider to be the fishing ground?—Yes; they will not put it down anywhere. They will be on the fishing ground to-night if there is a gale of wind, although they will not be the entire distance they will have to go to join the fleet.

11,183. Is the fishing ground in any way marked by having a smooth bottom or particular banks; is it a particular bank, or what is it that specifically forms a fishing ground?—Of course we like to have smooth ground; if it is at all rocky we lose our gear.

11,184. Is any part of the sea that has a smooth bottom naturally formed for a fishing ground?—Yes.

11,185. Does any part of the sea between this and Holland constitute a fishing ground upon which you are pretty sure to catch fish?—Yes.

11,186. I mean without reference to the Dogger Bank, the Silver Pits, or any other well known place that is constantly fished?—Yes, it is all fishing ground between here and Holland. There is a little rough in some places but our men know where those places are by constant practice; they know very well by their lead when they come to the rough ground.

11,187. How far out at sea would it be prudent for them to begin to fish?—About 20 miles.

11,188. It would not be prudent for them to commence fishing before they get out at sea for 20 miles?—No. Perhaps they would fish just outside here in

summer time within sight of land. The Yarmouth vessels occasionally fish within sight of Yarmouth, but not often.

11,189. Do they not practise fishing here because they find that they can do better by going further out sea?—Yes decidedly.

11,190. Are there any open undecked boats fishing at Yarmouth?—I don't know.

11,191. Have you had anything to do with the herring fishery here?—Not anything at all.

11,192. Then you have no knowledge upon that point?—No.

11,193. (*Professor Huxley.*) Did I understand you to say that you began your business 50 years ago?—Even more than that.

11,194. How many years ago?—I was bound apprentice when I was 14 years of of age.

11,195. And have you been connected with the fishing trade either as fisherman or owner of smacks ever since?—Yes, ever since; and now I am 66 years old, so that I have been it a good long time.

11,196. You served your time in the first instance as apprentice?—I never served it quite out. I was put forward and made master of a smack before my apprenticeship was out. I had what we call a "nurse" with me to show me the abouts of the thing, but in the course of a year or two I had a vessel built for me.

11,197. How many years were you actually working in a smack yourself?—About six or seven years.

11,198. Then you are yourself thoroughly acquainted with all the practical details of the fishing?—Yes.

11,199. After you had been a fisherman for six or seven years you did not work the smack yourself but became a smack owner?—Yes.

11,200. I suppose from that you had something at your back besides the mere earnings you obtained as a fisherman?—Yes, certainly; my friends were born before me.

11,201. It did not all come out of what you got by trawling?—No.

11,202. I ask these questions from no desire to be inquisitive, but simply to ascertain whether the trawling business is of a profitable character?—I may say that it did all come out of trawling.

11,203. (*Mr. Lefevre.*) Do you mean that you repaid the capital advanced to you?—Yes.

11,204. (*Professor Huxley.*) Then it did come out of the business of trawling?—Yes, but not altogether from trawling, because I did and still do at present a little hook-fishing. I have now six vessels fishing off here for haddock and cod, but the principal part of the business I have been engaged in is trawling.

11,205. In what condition did you find that the fish came up when the trawl was brought up?—In what condition?

11,206. Yes, were they alive or dead, or how were they?—They were mostly dead.

11,207. Did that depend upon the time the trawl had been down?—Yes, to a certain extent. Of course the longer it is down the more likely the fish are to be dead. If there is settled fine weather we are able to make short hauls, and the fish in that case will be pretty lively.

11,208. What do you call short hauls?—Two or three hours. We generally go with the tide, and that would be about four or five hours. It takes us a little time to shift our ground and to take our gear up and put it down again.

11,209. If you have had moderately fine weather and have had the trawl down for five hours, will the majority of the fish be dead or alive?—Dead.

11,210. Is there anything peculiar in the make of your trawls, compared with the trawls used by the north country fishermen?—No.

11,211. What is the length of the beam?—The beam used in the north country is longer than ours.

11,212. What is the length of yours?—From 34 to 36 and 37 feet.

11,213. Did you ever feel yourself under obligation to use any particular length?—No.

11,214. In your experience as a fisherman and smack owner can you say whether you have been interfered with by government officers or other authorities, or whether you have had your trawls examined?—No.

11,215. Do you use any particular kind of mesh to your trawl?—No.

11,216. What is the size of the mesh you use?—I don't know the size.

11,217. Do you consider yourself at liberty to use any mesh you like?—Yes.

11,218. When you were a fisherman, were you in the habit of loading the ground-rope?—Loading it with lead?

11,219. Yes.—Yes, we did so.

11,220. Did you use any particular weight of lead?—No, it was all owing to our fancy. We use chains now a good deal.

11,221. In point of fact you did as you liked?—Yes.

11,222. When the fish came up in the trawl, were they at all damaged?—Sometimes they will be a little chafed, but nothing to speak of.

11,223. Were the fish ever rendered unsaleable in consequence of the injury they had sustained in being brought up in the trawl?—They were never rendered unsaleable, if they got to market in decent time.

11,224. I am not asking you about that; I am speaking of the effect produced by bringing them up in the trawl?—Exactly. I perfectly comprehend you.

11,225. Were they ever so damaged when you got them on deck that they were rendered unsaleable?—No.

11,226. Were any considerable proportion of them damaged?—No.

11,227. The damage you referred to arises from them being kept at sea and becoming spoiled?—Yes, in consequence of the vessel losing her market.

11,228. Have you in the course of your experience noticed any falling off in the size of the fish during the last 50 years?—No.

11,229. You think that the average size is about the same?—Yes. With regard to the haddocks they have increased in size; the haddocks are half as big again as they used to be.

11,230. The haddocks are larger?—Yes, I never saw such haddocks as we are getting at the present day.

11,231. Have you any idea of the length of the haddocks you get now?—Yes, about 18 inches and sometimes more than that.

11,232. Do you think that they are more abundant than they were formerly?—Yes, certainly they are.

11,233. I understand you to say that you employ five or six vessels in line-fishing?—Yes.

11,234. Have you done that for many years?—Yes.

11,235. What is the principal fish they catch?—Haddock, cod, and whiting.

11,236. Where do they fish?—In the north-east Knoll and the Well Bank.

11,237. Do they get as many haddocks as they were in the habit of getting formerly?—I have not noticed much difference. They have had a very fine voyage with regard to haddock and cod within the last few weeks.

11,238. Then you have not noticed any falling off with regard to the haddock and cod?—No, a week or two ago one of my vessels made a voyage and was engaged in the fishing for five days, and when she came back she had over 100 score.

11,239. (*Mr. Lefevre.*) Are the vessels you employ in the line-fishing decked boats?—Yes.

11,240. (*Professor Huxley.*) They are able to keep the sea?—Yes, they never go into harbour.

11,241. What is their tonnage?—*55, 56* and 58 tons.

11,242. (*Mr. Lefevre.*) They are much the same size then as the trawlers?—Yes, they engage in trawling in the winter.

GREAT YARMOUTH.

S. Hewett.

16 Nov. 1863.

11,243. (*Professor Huxley.*) How many men do they carry?—From seven to eight hands.

11,244. And how many lines?—They all fish with hand-lines. They only fish with two hooks on a line.

11,245. For how many years have you employed these half dozen hookers?—We never had so few until lately. We used to have a great many more until a comparatively recent period.

11,246. Why do you not employ as many as you do in trawling?—We like the trawl work better.

11,247. Do you find that it is more profitable?—Yes.

11,248. You have not given over using the line-boats in consequence of the falling off in the quantity of fish they caught?—No, they occasionally have a great catch of fish.

11,249. Do you think that the whiting are as abundant as they were some years ago?—I do not think they are, but I know very little about them. There is a class of vessels that go on purpose to catch whiting. We do not use ours for that purpose; we never go specially for whiting.

11,250. Are the smacks that are employed now for trawl-fishing larger than they were formerly?—Yes.

11,251. Can you tell us what is the cost of a trawl-fishing smack with its fittings?—At the present day a trawl-boat will cost from 800*l.* to 900*l.* It used to cost more.

11,252. Does the trawling take place now over the same ground that it did 50 years ago? Can you tell us that from your recollection?—Yes, only we go further now than we did in my early days. They go now to the Dogger Bank.

11,253. Are you acquainted with any particular ground where trawling takes place now where it used to occur 50 years ago?—All about the Dutch coast the trawling was exactly the same 50 years ago as it is now.

11,254. Upon an average, is the quantity of fish taken by a boat the same now as it used to be 50 years ago?—I think so.

11,255. Am I to understand that trawling has gone on ever since over the same ground?—Yes.

11,256. And yet the yield of fish remains much about the same?—Yes, we used to carry them ourselves every day, and if we got from six to eight bushels of soles we called it a voyage; but then we had to get them up without any steam or ice or railroads or any of the facilities we now possess. That was a very different state of affairs. A vessel then was not in the habit of fishing for more than three or four days, and now we have them remaining out at sea for five or six weeks.

11,257. More continuous fishing goes on now than formerly?—Yes.

11,258. The ground is more worked?—Yes.

11,259. Do you find that there has been any falling off in the yield?—No.

11,260. Can an English boat fish within any distance she likes off the Dutch coast?—Yes, I have fished almost close in shore, so close that I could have thrown a biscuit on shore.

11,261. And the Dutch authorities have not interfered with you?—No.

11,262. Did you and the Dutch fishermen fish harmoniously together?—Yes.

11,263. You never meddled or interfered with each other?—We used to buy their turbot at that time.

11,264. Do the Dutch fishermen fish off here?—Yes, sometimes.

11,265. Can they catch fish off this coast within any distance they like?—I do not know; I believe not.

11,266. Have you any acquaintance with the herring fishery here?—No.

11,267. (*Mr. Lefevre.*) Do you meet the Dutch boats on the Dogger Bank?—Well, I think not. We have been with the Dutch boats in the latitude of the Dogger Bank, mostly to the east of the Dogger.

11,268. How many of your boats do you send out to the Dogger Bank; do you send your own fleet?—Yes, we have had the whole of them there, sometimes from 80 to 90 sail with our friends fishing with us. There are very frequently from 80 to 90 sail in the fleet.

11,269. It has only been within the last two or three years that you have gone to the Dogger Bank?—Yes.

11,270. Do you send smacks out in order that they may convey the fish to London?—Yes, we send out cutters.

11,271. How many cutters do you employ?—We have about 12 or 14 first-rate vessels, and a few of a middling character. Altogether we have about 18 carriers.

11,272. And besides that you have 50 or 60 fishing boats?—No.

11,273. Are the cutters included in that number?—Yes, and they fish as well as carry.

11,274. Do you find that you can get an increased price for the fish caught by the hook as compared with those caught by the trawl?—Only for the large cod. It is very desirable to bring in the cod alive, if possible; we want to crimp it if we can. If we do not crimp it we cannot get as good a price for it.

11,275. Then you get a better price for the line-cod?—Yes, sometimes we get double the price.

11,276. Do you catch any large number of small fish in the trawl?—What do you mean by small fish?

11,277. I mean small fish that are immature and unsaleable?—We get a few occasionally.

11,278. Can you state what is the proportion?—We do not get any large quantity.

11,279. Are they thrown overboard?—We throw a few overboard, and a few, in my time, we used to give to the boys in the shape of perquisites. They were quite saleable and eatable, but they were worth very little money.

11,280. What kind of fish would they consist of?—Dabs and small gurnets generally.

11,281. Were there any young haddocks or young soles?—No.

11,282. Your cutters take all the fish to the London market?—Yes, principally.

11,283. They do not come in here?—No, very seldom.

11,284. (*Mr. Caird.*) Is the London market the principal market to which you send your fish?—Yes.

11,285. Can you get the best price for it in London?—Yes.

11,286. Do you ever supply any other market besides London?—No, none.

11,287. You have had a long experience of trawl-fishing, do you know whether our system of trawl-fishing had its origin in this country or in Holland?—I am unable to answer that question. I have not the least idea.

11,288. Trawl-fishing has been practised as long as you have any recollection?—Yes, as long as I can remember, and my father before me was a fisherman.

11,289. Do you know any fishing ground in your experience that has been exhausted at all by trawl-fishing?—No, I do not.

11,290. Has any particular fishing bank been fished so closely that the catch has become diminished?—No, I think not.

11,291. Not within your knowledge anywhere along this coast?—No.

11,292. Do you ever with your trawl-vessels foul the long-line fishermen's lines?—Very seldom. We very seldom get near them. I do not remember seeing the long-line fishermen fishing with us in my experience.

11,293. (*Mr. Lefevre.*) You mostly fish outside?—Yes, quite out at sea.

11,294. (*Mr. Caird.*) Yes; but the long-line fishermen fish a long way out at sea?—Yes, they go on the Dogger Bank sometimes.

11,295. Is it not within your knowledge that the long-line fishermen's lines have been fouled by the trawlers?—I have seen the Dutch fishermen lining for turbots, but in my time I never saw a vessel lining for cod or haddock.

11,296. Did you ever bring up a large quantity of spawn in your trawl net?—No, I never saw anything of the sort.

11,297. Is any large proportion of the fish caught by the trawlers mangled, and in consequence rendered unfit for food?—No.

11,298. Is any large proportion of it ever thrown overboard as unfit for food?—No.

11,299. I think you said that there was no officer or authority to interfere with you as to the size of the mesh of your net?—Never to my knowledge.

11,300. Do you not act on any rule as to the size of the net, or do you adopt such size as you yourselves think best?—We adopt the size we think best ourselves.

11,301. (*Mr. Lefevre.*) Are you of opinion that there ought to be any regulation as to the size of the net, or the size of the mesh, or the length of the beam?—No, I think the fishermen ought to know best what size they like, and I think they ought to be allowed to act up to that.

11,302. (*Mr. Caird.*) You do not desire any Government authority or interference to come between you and your fishing?—Not in the least.

11,303. Do you complain of any foreign vessels coming upon your fishing ground?—No.

11,304. Then you desire to be left free to take any fishing ground you please, and let the foreigners do the same?—Yes. I think that if you put a stop to trawling you will raise the price of mutton and beef twopence a pound at the least.

11,305. Upon what do you ground that opinion?—Because if trawling is put a stop to there will be so small a quantity of fish sent into the market. At this moment we are able to send from 100 to 200 tons of fish into the London market every day from trawl vessels.

11,306. Do you believe that you furnish the larger supply of fish sent to the London market?—Yes, decidedly, so far as the bulk is concerned.

11,307. Have you any idea what the proportion is you supply as compared with that supplied by the line fishermen?—There is no comparison. Our season lasts all the year round. There is the cod season, the haddock season, the herring season, and the mackerel season. All these fish have their seasons, lasting only a few months, but trawling is carried on all the year round.

11,308. Do you happen to know whether there are more vessels engaged in trawl-fishing than in line-fishing?—Yes, I should say there are three, or four, or five to one.

11,309. Then, speaking of the whole of the east coast of England, you say there are more fishermen engaged in trawl-fishing than in line-fishing?—Yes, decidedly.

11,310. Is the number much larger?—Yes, considerably larger.

11,311. Have you any accurate statistics you can give us upon that point?—No; I only know that there are very few vessels engaged in line-fishing out of Greenwich, Barking, and Gravesend. They are the principal liners I know anything of. With regard to the cobles I know nothing of them. I have been round among them, but I do not know what their numbers are. This, however, I do know, that where there is one man engaged in a line-fishing vessel there are three or four men engaged in trawling.

11,312. Do the trawl-boats fish chiefly for the London market?—No.

11,313. Do they supply Manchester, Birmingham, and the large towns?—The Hull people principally supply Manchester, Birmingham, and the large towns about there.

11,314. South of Hull, do the trawlers chiefly send to the London market?—Yes, their fish goes off to London invariably.

11,315. And is it then distributed throughout the country?—Yes, sometimes.

11,316. With regard to the price of fish, in your experience has it increased or diminished within recent years?—I do not know that there has been much difference in the price.

11,317. Of late years there has been a gradual rise in the price of meat, has there been a similar gradual rise in the price of fish?—I do not think there has been so much difference. If the fish are scarce they fetch a good deal of money, but we would rather have them plentiful and have a middling price for them.

11,318. It pays you better to have a good supply of fish and a middling price?—Yes.

11,319. Does it ever happen that you overstock the market?—Very seldom. Now and then we beat the market with Dutch plaice, but it is not often.

11,320. That soon passes off?—It never lasts longer than a day.

11,321. You gave me the proportion of fish caught in a trawl, which of the different kinds of fish will sell at the highest price, soles, haddocks, or plaice?—Soles.

11,322. Soles bring the highest price per pound weight?—Yes.

11,323. What brings the next highest price?—Turbots and brill, and then haddocks, but they bring a low price, there is such a lot of them coming in.

11,324-5. Are the haddocks chiefly sold to the poorer classes?—Yes, and we make a great trade of haddocks by smoking them. That is our principal trade in haddocks.

11,326. With regard to plaice and whiting, are they still lower in price?—They are low in price.

11,327. Are they lower than the haddocks per pound weight?—No, about the same, but it is all owing to the supply.

11,328. (*Mr. Lefevre.*) How long do your boats remain out at sea?—Six weeks from here, eight from Barking.

11,329. How many voyages do the cutters make in that time?—Sometimes one voyage a week.

11,330. Do your boats go in numbers together, five or six, or many at a time?—Sometimes one goes alone, sometimes there will be three or four, it is just as it happens.

11,331. Do the cutters experience any difficulty in finding them?—No, they mostly find them pretty soon.

11,332. What is the proportion of the cutters to the fishing boats?—There are about 50, or 60, or 70 fishing boats in a fleet, perhaps 100 sometimes, and they will have 10 or 15 cutters.

11,333. (*Professor Huxley.*) Do you know a fishing ground called the "Brown Ridge"?—No, I never heard of it.

11,334. When you have been trawling, has it ever happened to you to be trawling over a long narrow piece of ground for some time?—Yes, at Smith's Knoll.

11,335. How long is that bank?—About 12 miles long.

11,336. And it is not above a mile or a mile and a half wide?—Not so much as that; it is only about three quarters of a mile wide.

11,337. And about 12 miles long?—Yes.

11,338. How many vessels have you seen trawling off that bank at one time?—I have seen a great many indeed trawling there in the height of summer.

11,339. How many fathoms apart?—50 or 100.

11,340. Have there been as many as 50 vessels drifting with the tide and back?—Yes.

11,341. For how many weeks together will that go on?—The season did not last long at that time, but now it lasts longer.

11,342. How long will it last, at a rough guess?—Some of the Yarmouth vessels are there all the year round off and on.

11,343. Were you ever there yourself?—Yes.

11,344. How many weeks have you been there?—We used to come in then on the Friday.

11,345. You went week after week?—Yes.

11,346. For how many weeks would you be doing that?—For six or eight weeks.

11,347. Did you ever notice any difference at the

GREAT YARMOUTH.

S. Hewett.

16 Nov. 1863.

end of six weeks in the quantity of fish taken as compared with the quantity taken at the commencement?—Not in the least, but it all depends on the weather and the tide.

11,348. Did the sternmost vessel get a less quantity of fish than the foremost?—There might be a little difference one vessel with another, but it was nothing to speak of.

11,349. Then on the average of the vessels trawling there backward and forward for six or eight weeks together, they would all get about the same quantity of fish?—Yes, one might get a great many more than another in one take, but on the average there would be very little difference.

11,350. But that might happen as much to a vessel at the front as to a vessel at the stern?—Yes.

11,351. The vessels that went first would not clear the ground for the vessels that came after?—No.

11,352. (*Mr. Lefevre.*) What is the greatest depth that you can fish with advantage in trawling?—We have been fishing in 40 fathoms of water in the Silver Pits.

11,353. (*Mr. Caird.*) Do you find that your sailing cutters which take the fish to the London market generally make the run in time to supply the fish fresh to the market?—Yes, with the assistance of ice.

11,354. Did you ever employ a steamboat to do that?—We have had steamboats to meet them off the light on the Ness.

11,355. Did it never occur to you to employ steamboats instead of sailing cutters?—We tried it one summer but it did not answer.

11,356. They did not answer?—The expense was very heavy and the steamer was never where she ought to be. It required two or three vessels to do it properly. We tried the experiment once and it did not answer.

11,357. (*Mr. Lefevre.*) You say that you have a steamer to meet the boats at the Ness in the summer?—Yes, occasionally.

11,358. Is that when there are light winds?—Yes.

The witness withdrew.

C. Spashett.

CHRISTOPHER SPASHETT called and examined.

11,358*a*. (*Mr. Caird.*) Have you been long acquainted with the fishing at Yarmouth, Mr. Spashett?—Yes.

11,359. Do you belong to Yarmouth?—No, I belong to Gorleston.

11,360. Are you yourself a practical fisherman?—Yes.

11,361. Are you at present engaged in the fishing business?—No.

11,362. Are you an owner of fishing smacks?—No.

11,363. Are you connected with them in any way?—Not now.

11,364. Were you for some years engaged as master of a fishing smack?—Yes.

11,365. Then you have a practical knowledge of the mode of fishing practised off this coast?—Yes.

11,366. How long is it since you were at sea in a fishing smack?—About 14 or 15 years.

11,367. In your experience here has the number of vessels employed in trawl-fishing increased or diminished?—It has very largely increased.

11,368. Is that increase still going on?—Yes.

11,369. Within your knowledge has the quantity of fish increased also?—Decidedly.

11,370. Does that apply to all kinds of fish?—Yes, to all kinds of fish.

11,371. There has been no diminution of any kind?—No.

11,372. Neither in the size nor in the quantity?—I think not.

11,373. Do you agree with the previous witness that the size of the haddocks has increased?—I do.

11,374. Are there any fishing grounds off Yarmouth which in your knowledge were prolific of fish formerly, but have ceased to be so?—No, none.

11,375. Are all the fishing grounds off Yarmouth as productive of fish as they ever were?—The quantity of fish caught now is quite equal to what it ever was.

11,376. Are there any line-fishers here?—I think not, belonging to the port of Yarmouth.

11,377. Have there never been any in your time?—No.

11,378. There has been no change then in fishing from line-fishing to trawling?—No.

11,379. In the boats that you have been connected with had the fishermen a share in the catch of the fish?—No.

11,380. They were simply paid wages?—Yes, they were simply paid wages.

11,381. Had they no per-centage on the produce of the fishing?—Not the fishermen, only the masters.

11,382. Has that always been the custom among the fishermen here?—It has during my time.

11,383. (*Mr. Lefevre.*) Were you the owner of the smack you were in?—I had several at one time, but I have none now.

11,384. Were you the owner of the one in which you sailed?—I was owner and sailing master also.

11,385. (*Mr. Caird.*) Is it the case that the fishermen employed here in trawling have principally risen from being common fishermen to be the owners of smacks?—Yes.

11,386. Is that the case with many fishermen here?—Not perhaps in this town, but it is in the place I come from, namely, Barking.

11,387. But not here?—There are a few I believe.

11,388. Have you ever observed in fishing with the trawl net that many of the fish are mangled or injured by the trawl when they are brought on deck?—No.

11,389. Are there any small immature fish caught by the trawl?—No; the mesh of the net is so large that very few are caught.

11,390. But do not the meshes draw together and become filled with rubbish or weed from the bottom of the sea occasionally?—I never saw any quantity of small fish taken.

11,391. But are there not always small fish taken?—There are a few at times.

11,392. Does that depend on the depth of water you are fishing in?—Sometimes in deep water we get a few, and sometimes we get some when we are fishing in shallow water.

11,393. What proportion of the fish you take will be small compared with that which will be marketable?—The proportion is very trifling indeed, simply a handful; sometimes there may be a few dabs and gurnets and such like.

11,394. What do you do with them?—We throw them away or give them to the boys.

11,395. But I understand you to say that no large proportion of the fish you take is of that kind?—No, very few indeed.

11,396. What quantity in weight of fish altogether will there be in an average haul?—Perhaps from two to three tons.

11,397. That is beyond an average, is it not?—Yes, that is decidedly beyond an average.

11,398. What is the largest haul you ever saw?—I think I have seen three tons taken at one haul.

11,399. Is that the largest?—I think so; there were about 140 score of haddocks, besides other fish, and I think the take altogether weighed about three tons.

11,400. Could you make two such hauls in a day?—No, we could not do that and get ashore to market with the fish.

11,401. Do you ever salt any of the fish on board when you could not bring them away fresh?—Very seldom.

11,402. Do you carry ice now?—Yes, there is ice on board all the cutters that carry the fish.

11,403. Do the fishing cutters carry ice?—There is no ice in the fishing smacks themselves.

11,404. And does it often happen that you are obliged to throw the greater part of your fish over-

board altogether, because you cannot get it to market?—Not very often, but it has occurred.

11,405. In stormy weather?—Yes.

11,406. There is no great proportion of the whole fishing lost in that way?—No.

11,407. Has the number of men employed in the fishing vessels increased in your time, and also the size of the vessels?—Yes.

11,408. Has the size and the length of the beam and of the net increased?—Yes; they are larger than they used to be.

11,409. Have you altered the size of the net in your time?—Yes, the net is larger than it used to be.

11,410. And the mesh is larger?—Yes.

11,411. Why did you alter it to a larger size?—We fancied that if a quantity of fish got in the net and any sand too there was a possibility of the net parting in consequence of the weight.

11,412. And you found it of advantage to enlarge the size of the net?—Yes.

11,413. Does it frequently happen that the net is broken in that way?—Yes, if the shealing is too small.

11,414. What is the cost of a trawl net?—A trawl net complete will cost from 8*l.* to 10*l.*

11,415. How long will it last?—That depends upon the ground over which it is worked. If the ground is clear and nice for fishing it will last two months at certain seasons of the year.

11,416. Do you not endeavour to choose a clear ground?—Yes.

11,417. Can you not ascertain at once whether the ground is clear when you put the net down?—We can, generally, before we put the net down.

11,418. How do you ascertain that?—By putting down the leads; we always do that.

11,419. You always do that?—Yes; a good fisherman would do so.

11,420. Do you agree with the previous witness, that wherever the ground is clear you can find fish off this coast?—Yes.

11,421. Then you have no need to go to any particular fishing bank before you can find fish?—No; we can find fish 15 miles off this shore, and right across over to the Dutch coast.

11,422. Then anywhere from 15 miles off the land here to the opposite coast you can find fish?—Yes, up to within 15 feet of water on the Dutch coast.

14,423. Then there is an immense extent of fishing ground open to you between this and the Dutch coast?—Yes; there is an immense ground indeed.

11,424. Do you suppose with all the vessels that have been fishing with the trawl, that the whole of that ground has been covered?—Most likely the whole of it has been some time or other.

11,425. The trawlers fish from side to side?—Yes, within 15 miles off this coast they do. With the exception of those 15 miles they fish from side to side.

11,426. And in the whole of your experience you have not found any particular part of the ground that appeared to be exhausted in consequence of being over-fished?—Certainly not.

11,427. Have you ever fished on the Dogger Bank?—Yes, on the south-east part of it.

11,428. Do you find that that is a better fishing ground than any other part of the channel?—It is a very good fishing ground, but the distance is very great.

11,429. What depth of water do you generally find to be the best depth for trawling, or has the depth of the water any effect in trawling?—The best depth is from 22 to 24 fathoms. We generally find more fish in that depth, unless in the summer time, and then we find fish in the shallow waters.

11,430. What depth of water is there on the Dogger Bank, I mean in that part which you are in the habit of fishing?—I have not been trawling there, but I have been lining there. I have never been trawling on the Dogger Bank.

11,431. Is it about 20 fathoms deep?—About 17 or 18.

11,432. (*Professor Huxley.*) Are you a Barking man?—Yes.

11,433. Are the vessels that have come here of late years mostly Barking vessels, or are they vessels that have been built here?—They are vessels that have been built here.

11,434. Are no Barking vessels brought here?—No.

11,435. They are vessels that have been built in this place?—Yes, the whole of them.

11,436. Are you aware of what Mr. Hewett stated about Smith's Knoll. I mean with regard to the fishing up and down the ground there?—Yes.

11,437. Do you agree with that?—Yes.

11,438. Do you know a fishing bank called Brown Ridge?—No, I know a place called Brown Bank.

11,439. It is marked Brown Ridge on the chart; it is a great place for fish, is it not?—Yes, it is a very extensive ground.

11,440. Do the herrings gather there as well as other fish?—I have never seen any herrings there.

11,441. Are you a herring fisherman?—No, I am not.

11,442. Is there a great quantity of flat fish there?—Yes, a great quantity at times.

11,443. Have you any notion of the reason why fish gather on those banks and on such places as the Brown Ridge and Smith's Knoll?—We consider the reason to be that the ground is rich in food.

11,444. Did you ever examine the stomachs of the fish when you gutted them?—Yes.

11,445. What did you find in them?—Soft mud, shells, small fish, and so on.

11,446. Did you ever find spawn in the stomach of the turbot?—No, I never saw any.

11,447. Did you ever find it in the stomach of the haddock?—Yes.

11,448. What kind of spawn was it?—Herring spawn.

11,449. What time of the year did you find it?—We generally find it when we take it with a hook.

11,450. What time of the year would that be?—In October, and part of November.

11,451. Whereabouts did you find it?—Most likely in the north-east Knoll, about 36 miles from Cromer.

11,452. Do you think that is a place where the herring spawn?—They do spawn there no doubt.

11,453. Did you ever find herring spawn in the stomach of the turbot?—Never.

11,454. Do you agree with the last witness as regards the size of the haddocks?—Certainly I do, they are very fine now.

11,455. You do not think that there has been any falling off in the last 30 years?—I do not.

11,456. Do you think they are scarcer than they used to be, or are they quite as plentiful?—They are quite as plentiful; you can put your net down and get 150 score at a draught off the Dogger Bank.

11,457. Did you ever see spawn come up in the trawl?—Never on any one occasion to my knowledge.

11,458. You said just now that you had nothing to do with the herring fishery?—No, I am not a herring fisherman.

11,459. Have you ever had anything to do with the mackerel-fishing?—No.

11,460. (*Mr. Lefevre.*) How long is it since you came from Barking?—About nine years.

11,461. How long did you work there?—About 41 years.

11,462. What wages do the fishermen get here?—The common fishermen will get 16*s.* and the masters 18*s.*

11,463. Has there been any diminution in the wages of the fishermen?—No, they are the same now as they have been during the last 25 or 30 years.

11,464. Are they the same here as at Barking?—I think they are quite as good, they are certainly not less.

11,465. Have you any complaint to make of the number of trawlers off this port?—No, certainly not.

GREAT YARMOUTH.

C. Spashett.

16 Nov. 1863.

11,466. You think there is plenty of room for them?—Yes, and for 500 sail more.

11,467. There is plenty of ground for the trawlers to go over?—Yes, plenty.

11,468. (*Mr. Caird.*) Did you ever trawl within the headlands in the bays along this coast?—Never.

11,469. We have had complaints made to us by the line fishermen that the trawl-vessels further north come in to the injury of their in-shore fishing in the bays; you say that you never did that?—No, I never knew a case of the sort.

11,470. Is it the practice for all the trawl-boats at Yarmouth to fish at the same distance from the land and not within the bays?—They all fish in the deep sea.

11,471. And never in the bays?—Never to my knowledge, always in the deep sea.

11,472. Do you think that any restriction could be imposed on your mode of fishing with advantage to you?—I think not.

11,473. You think it better that you should be left entirely to follow your own plans as to the size of the vessels, the size of the nets, and the size of the mesh of the nets?—I do.

11,474. (*Mr. Lefevre.*) Do many of the trawlers land their fish here or do they mostly send them to London?—The whole of the vessels belonging to this port land their fish here.

11,475. Do they send it here by cutters?—Mostly by cutters.

11,476. Is there any means of ascertaining the quantity of the fish landed on the beach here?—I think not.

The witness withdrew.

N. Apter.

NICHOLAS APTER called and examined.

11,477. (*Mr. Caird.*) Are you a fisherman here?—Yes.

11,478. Are you master of a fishing vessel?—Yes.

11,479. Have you been long engaged in that capacity?—From 15 to 20 years. It is 20 years since I first went fishing, I think.

11,480. Have you continued during those 20 years to be fishing off this place?—I have followed nothing else but fishing.

11,481. What is the size of the vessel you have charge of?—60 tons, according to the old measurement.

11,482. Have you any share in the vessel yourself?—Yes.

11,483. Have you observed in your experience during the last 20 years whether the quantity of fish has increased or diminished?—It has increased.

11,484. What have been the size and quality of the fish?—They have been a great deal larger in size and there have been more fish too.

11,485. Has there been no change made in the size of the vessels you have been in the habit of fishing in during those 20 years; is the vessel in which you fish now larger than it was formerly?—Yes.

11,486. Do you use a larger net?—No, it is not so big as it used to be.

11,487. What is the size of the net now?—16 feet goring and 16 feet bosom.

11,488. What is the length of the beam?—36 feet.

11,489. Is that larger than it used to be?—No, not so large.

11,490. What is the reason you have taken to a smaller net?—Because there is more tide here and when it runs strong it shuts the nets up.

11,491. Do you require a different kind of net in fishing different places?—Yes.

11,492. Where the tide runs strong do you require a smaller net?—Yes.

11,493. Does that apply chiefly to in-shore fishing?—No.

11,494. At what distance from the shore do you chiefly fish?—I have been about 150 miles from Yarmouth this time.

11,495. On the Dogger Bank?—Yes.

11,496. Is there any part of the fishing ground on this shore that you have been principally in the habit of frequenting during the last 20 years?—I have been off all parts.

11,497. Have you been repeatedly in the habit of going over the same ground?—Yes.

11,498. And at the same season?—Yes.

11,499. And you never found that you had exhausted the quantity of fish on that ground?—No, according to the different seasons of the year the fish take away. They may be found at one place at one season and at another another.

11,500. You follow them from one ground to the other?—Yes.

11,501. What is the reason that has induced you to go to the Dogger Bank lately?—There are so many vessels on this coast that if we were all to remain here there would not be a living for the whole of us. We are obliged to distribute ourselves, so that we may not get foul of each other.

11,502. Are there many vessels fishing close in-shore now?—No, not close in-shore?—I think the nearest the shore they come is Smith's Knoll.

11,503. How many miles is that?—22.

11,504. How many boats are there, now?—I don't know.

11,505. Have you not fished there this season?—No, not for two seasons.

11,506. Then during these two years where have you been fishing?—About Botany Gut, and the Silver Pits, and across to the other side—to Schelling and the Texel.

11,507. Do you find that you can make as good a run with your fish to London from those more distant places as if you were fishing nearer home?—We like it much better because we can find more fish.

11,508. You can find more fish?—Yes.

11,509. Has it always been the case that you can find more fish by going a greater distance?—When I first went to sea there was not one half or one quarter the quantity of fish caught that there has been caught during the last five years. I have been on the Dogger Bank and in a three-hours haul I have got as many fish as we could get on board.

11,510. When was that?—This season.

11,511. You have been there this season?—Yes.

11,512. And you got a good haul?—Yes; in four weeks during the season we caught 326 packages of fish.

11,513. What weight would there be in each package?—Three half cwts.

11,514. What kind of fish did the catch principally consist of?—Haddocks and plaice.

11,515. Do you agree with the previous witness, that the quality of the haddocks is as good as it used to be or is even better?—Yes, and I sincerely believe that more fish are caught every year.

11,516. Has there been any great increase of vessels fishing on the Dogger Bank lately?—There have been about 60 sail fishing here.

11,517. When you first went on the Dogger Bank was it much frequented by vessels?—Not when I first went.

11,518. Have you no idea of the increase that has taken place in the take of fish on the Dogger Bank as compared with five or six years ago?—No.

11,519. Nor upon any other part of the grounds that you are more familiarly acquainted with?—I can only say that the more smacks there are the greater the quantity of fish appears to be. I have never seen any scarcity of fish at all.

11,520. I think you said just now that the smacks were so numerous on the coast that you found it of advantage to go further out in order to get a living?—Yes.

11,521. But if you get more fish the more you fish

why should you go further out?—We always get more fish down to the northward. We get more soles at this part at Yarmouth, but more offal there.

11,522. What do you call "offal"?—Haddocks and plaice.

11,523. They are called offal in the trade?—Yes.

11,524. Is that because they are caught in the largest quantity and bring the lowest price?—I suppose so.

11,525. Do you get many cod and turbot?—Not many cod. We get one or two turbot, perhaps two or three in a haul.

11,526. Can you stay out in all kinds of weather in your vessel?—Yes.

11,527. Do you keep the sea in stormy weather?—Yes.

11,528. Do you ever render assistance to vessels in distress?—Yes.

11,529. Do you ever act as pilot?—Yes.

11,530. Do you ever come upon the long-lines of the long-line fishermen?—No.

11,531. Did you never foul any long-lines in your knowledge and experience?—No.

11,532. Do many of the fish come up in the trawl mangled?—I can't say.

11,533. I mean mangled and knocked about, so as to unfit them for being sent to the market?—There are not many unless we may jump upon one or two when we get them in.

11,534. Will they be so injured that they cannot be sent to market?—Sometimes we may jump upon some of them when we are hauling them in, and injure them.

11,535. What is the largest quantity of fish you have caught in one haul?—About 30 baskets, but more have been caught by other fishermen.

11,536. What is the largest quantity you have heard of?—Seventy baskets.

11,537. Seventy baskets, each weighing one hundred weight and a half?—Yes, but we don't get them all in at one time.

11,538. What do you mean?—We have to sweep the net and get them on deck at different times.

11,539. You don't lower the net again?—No, they are all in the net.

11,540. At the same time?—Yes.

11,541. Does it frequently happen that you don't get any at all?—Yes, when we have had a calm we have had the net down for 24 hours, and have not got enough for a single person to eat.

11,542. Does that often happen?—No, only when it is calm, and there is no wind to take us over the ground.

11,543. In such a case the vessel would be comparatively stationary?—Yes.

11,544. In short you would not fish the ground at all?—No, she has had her anchor down.

11,545. Do you find that you get the best fishing when you get a strong breeze, or a nice gale?—We get the best when we have a nice wind. In stormy weather we don't put the trawl down at all.

11,546. Not when it blows a heavy gale?—No.

11,547. (*Professor Huxley.*) Do you ever get fouled with the drift nets?—Never.

11,548. Never in all your experience?—Yes, I think I did once.

11,549. That was at night, I suppose?—It was in a thick fog.

11,550. In the night time?—Yes.

11,551–2. Do you carry any particular kind of lights?—Yes, the mast head light, as the club requires.

11,553. What club is that?—The club the vessels belong to at Hull.

11,554. Do you belong to a club at Hull?—Yes, and we are required to carry a light such as other ships have for anchor lights.

11,555. Suppose you were working your trawl, and you came across the drift men with their nets out, are you bound to get out of their way?—Sometimes we cannot do so.

11,556. Do you feel any obligation to get out of the way?—We do if we can.

11,557. Is that for any particular reason?—No.

11,558. Do you know that you are punishable if you don't do so?—I have heard so.

11,559. Were you ever punished?—No.

11,560. Have you ever heard of anybody that was?—I believe some have been punished at Hull.

11,561. Did it ever happen to any fishermen in this neighbourhood, or on this coast?—No.

11,562. Are there any vessels about here at the time the herring fishing is going on?—Yes.

11,563. I mean Revenue cutters, or Government vessels?—I don't take any notice of them.

11,564. Have you yourself ever had anything to do with the herring-fishing?—No.

11,565. You heard what the previous witness stated respecting boats fishing one after the other?—That was not here.

11,566. The question I put was this, whether in trawling a number of vessels can work backwards and forwards over the same ground, and within a short distance of each other. Have you found that to be the case commonly?—Yes.

11,567. In such circumstances, is there any noticeable difference in the quantity of fish one will get as compared with the quantity taken by others?—Sometimes one will get more than another.

11,568. Would it be the foremost vessel or the sternmost?—I never took any notice.

11,569. Then it can't make much difference?—No.

11,570. Have you ever been fishing on Smith's Knoll under such circumstances?—Yes.

11,571. It is a narrow bank, is it not?—Yes.

11,572. How many vessels have you seen fishing there?—Perhaps 30 at a time.

11,573. What distance will they be apart?—A very short distance indeed; they speak to one another at times.

11,574. They are engaged in working backwards and forwards with the tides?—Yes.

11,575. Did you ever know which caught most, the sternmost or the foremost vessel?—Sometimes the sternmost, and sometimes the foremost.

11,576. How many weeks have you known these vessels to be fishing backwards and forwards over that bank?—Not more than three or four weeks. They shift about and go elsewhere.

11,577. Why do they shift?—Because the fish take off.

11,578. The fish go away?—Yes.

11,579. Did you find that you caught fewer fish at the end of four or five weeks?—Yes; less were caught at the end of four or five weeks than at the beginning. Sometimes at the beginning of May we go there and find there are no fish there at all.

11,580. Do you believe that the fish go there at particular seasons?—Yes.

11,581. It is not the fishing that takes the fish away?—No, not the fishing, that has no effect upon them. I believe that every trawl that goes over the ground, the more it disturbs the bottom, and brings up insects, gives the fish a greater opportunity of obtaining food. In my opinion that is the reason why more fish are caught year after year.

11,582. Then you think that trawling is a positive benefit?—Yes; I compare it almost to a farm. If you plough the fields and cast out all that is bad, year after year you get a better crop; so it is every year with us, we disturb the ground at the bottom of the sea and by disturbing the ground the sile comes up and the fish get a better opportunity of feeding upon it.

11,583. Have you ever had anything to do with mackerel-fishing?—No.

11,584. (*Mr. Lefevre.*) How long have you been the master of a fishing boat?—12 years.

11,585. What share do you get of the take?—A share, a quarter, and half a quarter.

11,586. Out of how many shares?—Out of eight shares, that is the master's wages.

GREAT YARMOUTH.

N. Apter.

16 Nov. 1863.

11,587. Do you find that your share comes to more or less now than it did when you first began?—It comes to more, but I find that things are a great deal dearer to buy.

11,588. What are your wages, including your share?—I never reckoned up. Sometimes we don't get more than 10*s.* a week.

11,589. What are your wages besides your share?—I have nothing more. We sail differently in our vessels from what they do at Yarmouth.

11,590. You depend entirely upon the take for your wages?—Yes; if we don't get any fish we don't get any money.

11,591. Who does the boat belong to?—Partly to me.

11,592. Who owns the rest of it?—My aunt.

11,593. Is that the only vessel you have got?—Yes.

11,594. Do many of the boats here belong to single persons or do they mostly belong to companies?—Generally to single persons.

11,595. Then do they sell their fish to the cutters that come out to sea?—We send it by the cutters to the salesmen.

11,596-7. Do you pay the cutters for the carriage?—Yes.

11,598. How long is it that your boats have been fishing on the Dogger Bank?—For the last seven or eight years.

11,599. You yourself have only been there during the last two years?—No; it is six years since I first went.

11,600. How far out towards the Dogger Bank do you go, ?—About 100 miles from land? I don't go right to the Dogger Bank.

11,601. You don't go quite as far as the Dogger Bank?—Perhaps I may go for 15 miles upon it.

11,602. You don't go to the further end of the Dogger?—No, if we did we should never get back again.

11,603. The cutters don't go as far as that?—No.

11,604. Do you come in-shore to meet them?—Yes. Sometimes we come in sight of land before we meet them.

11,605-6. Is the quality of the fish caught on the Dogger better than that caught elsewhere?—No, it is according to the season.

11,607. Are the haddocks finer?—Yes, they are very fine fish.

11,608. But are they finer than the haddocks caught on other grounds?—No, I think not.

11,609. Then there is no peculiar excellence in the quality of the fish caught upon the Dogger?—No. They go according to the time of the year. At this time of the year they are very good. Perhaps in the middle part of the summer they will be a little worse.

11,610. What is the reason of that?—I don't know.

11,611. Do they fish on the Dogger Bank in the summer?—No, they are too far away from market.

11,612. The fish would not keep as well, I suppose?—No.

11,613. Do you agree with the last witness that there is plenty of room for all the trawlers on the coast?—Yes.

11,614. And for more vessels?—Yes.

The witness withdrew.

I. Bridges,

ISAAC BRIDGES called and examined.

11,615. (*Mr. Caird.*) You are the master of a trawling smack here, I believe?—Yes.

11,616. Are you part owner?—No.

11,617. Have you long been master of a trawling smack here?—For 18 years.

11,618. Do you hail from here?—Yes.

11,619. What size is your smack?—40 tons.

11,620. What is the length of the beam of your trawl?—36 feet.

11,621. Have you increased the length or diminished it in recent times?—I have never seen any difference.

11,622. Have you always had it 36 feet long?—Yes, from 35 to 36 feet.

11,623. You have found that practically to be a good length?—Yes.

11,624. You are not influenced by the run of the tide in having it short at one time and long at another?—No, I never go far from here.

11,625. Do you go far out to sea?—Quite across to the opposite shore at times.

11,626. Do you go to the Dogger Bank?—No.

11,627. Are there any particular grounds off this shore which you have been in the habit of frequenting constantly, that are not yielding as many fish now as formerly?—No.

11,628. You get as many fish now as formerly?—Equally as many in each vessel, and of course more altogether as there are more vessels.

11,629. Do you know whether the number of vessels has been largely increased?—Yes, it has doubled and even trebled.

11,630. Not only from here but from other places?—I am not much acquainted with other places.

11,631. But the increase is not confined to vessels from Yarmouth?—No.

11,632. Do you find that the number of vessels is increasing on the grounds you frequent?—Yes.

11,633. Do the Dutch vessels come across here?—They come trawling within 45 miles.

11,634. Do you and they frequently trawl on the same ground?—Yes, frequently.

11,635. Both here and on the coast of Holland?—Yes.

11,636. Do the French vessels also come here?—Yes.

11,637. Are they as successful as you or not?—I don't know. I can't understand them if we speak to them.

11,638. Do you often go to the coast off Holland?—Yes.

11,639. Nobody interferes with you?—Nobody in the least. They allow us to go anywhere off the coast of Holland.

11,640. You can fish there where you like?—Yes.

11,641. Within the three-mile limit?—Yes.

11,642. Is there no three-mile limit observed on that coast?—No.

11,643. You have never been ordered off?—No.

11,644. You have never been interfered with in any way?—No.

11,645. Do the foreign fishermen bear any grudge or express it in consequence of your going upon their ground?—No.

11,646. Nothing of that kind occurs?—No.

11,647. You don't bear any grudge to them if they come upon your coast?—No.

11,648. You don't find that you do any injury to each other?—No.

11,649. You think there is plenty of room for all?—Yes.

11,650. Are the quality and size of the fish as good as they used to be?—Yes equally good.

11,651. Is there any kind of fish that has fallen off or decreased in quantity?—I know of no falling off.

11,652. Do you get as many haddocks as you used to get in proportion?—Equally as many.

11,653. Do you get as many cod in proportion?—We don't catch many cod.

11,654. Where are the cod caught that go to London?—Mostly down to the northward.

11,655. Are they caught by line fishermen?—Yes.

11,656. Then all those fine cod we see in London are caught by line fishermen?—I imagine they are mostly.

11,657. The trawl fishermen don't catch those fish in any large proportion?—No.

11,658. Do they catch turbot?—Yes they do.

11,659. Do they supply the largest quantity of turbot that goes to market in London?—The trawl men supply the largest quantity.

11,660. You catch turbot in the trawl?—Yes.

11,661. Do you get as many as you used to get?—Quite as many.

11,662. Do you get more?—I don't know that we get more. We get five or six some nights but at others we don't get one, and that has been the case ever since I have been at sea.

11,663. You don't observe any difference in the average catch nor in the quality?—No.

11,664. Do you find that your trawl injures the fish sometimes by mangling them?—No, I never saw them mangled or rendered unfit for sale.

11,665. Do you bring up many small fish?—No, not a great many.

11,666. On some particular grounds do you bring up a larger proportion of small fish than on others?—The fish are smaller in some places.

11,667. What do you do with the small fish?—Those that we consider of no good we chuck overboard.

11,668. Out of 30 baskets how many would you throw overboard?—Sometimes we get a basketful or half a basketful in a night's catch. There is no more than that of no service to us.

11,669. What becomes of these small fish?—The other fish eat them I believe.

11,670. You think they do?—I imagine that a great part of them do.

11,671. What do you consider an average take of fish in one haul by a trawl-boat?—I don't know.

11,672. What weight—what number of baskets?—They vary a great deal; sometimes we may get five or six, sometimes three or four, sometimes nine or ten.

11,673. What is the largest number you ever saw?—I never saw more than 40.

11,674. What will be the average quantity, taking a good boat, caught in the season?—I am sure I don't know; the fishing season is all the year round.

11,675. Well take all the year round?—I can't give much idea about the matter.

11,676. Do you fish upon the same ground in the summer time as in the winter time?—No, we go right across in the summer time into the shoal water.

11,677. Is that chiefly on the Dutch coast?—Yes.

11,678. Do you send the fish to market there?—We send them here.

11,679. You send them to Yarmouth for London?—Yes.

11,680. The Dutch coast is nearer to you than the Dogger Bank?—Yes.

11,681. It is a shorter distance for you to sail to the Dutch coast than to the Dogger Bank?—Yes.

11,682. In the summer time do you generally bring the fish in fresh to market?—Yes, the cutters have ice.

11,683. You send them over in ice in cutters?—Yes.

11,684. When they come here do you know what market they chiefly go to?—Chiefly to Billingsgate.

11,685. Is there nothing sent direct to Manchester, Birmingham, Leeds, and other large towns?—I dare say there is, but I don't know much about the markets inland.

11,686. Have you any interest in the price of the fish?—Yes, I get a per-centage.

11,687. You get a per-centage on the produce of your fishing?—Yes.

11,688. Has the price of fish increased during late years?—I don't see any difference; some seasons the price is better than at others.

11,689. But there has not been any marked difference in the price between one year and another?—No.

11,690. Are the cod not much dearer than they were 10 years ago?—I don't know much about cod.

11,691. Are turbot any dearer than they were 10 years ago?—I don't know much about the price of turbot.

11,692. Are you engaged in the herring-fishing at all?—No.

11,693. Then you have no knowledge upon that point?—No.

11,694. (*Professor Huxley.*) You have seen the Dutch fishermen fishing?—Yes.

11,695. Do they work with the same kind of trawl that you do?—Something after the same sort; but I don't know exactly how their trawls are fished.

11,696. You never examined them closely?—No; they generally fish with two trawls.

11,697. One on each beam?—No, one forward and one aft.

11,698. On the same beam?—Yes.

11,699. Have you any notion what is the length of their beam?—About 31 or 32 feet.

11,700. Do they carry the trawls on one beam 31 feet long?—Yes.

11,701. Then they can't work as fast as you do?—Yes they do.

11,702. (*Mr. Lefevre.*) Have they larger boats?—No, their boats are smaller.

11,703. (*Professor Huxley.*) Do they carry more sail?—No; they drift faster with the wind and tide. They are a great deal lighter than our boats, and their gear is lighter.

11,704. What is the size of the mesh they use?—I don't know.

11,705. Do you know the length of the net?—No, I don't know the length of the net, but the beam to the best of my knowledge will be 31 or 32 feet.

11,706. What number of men do they have in their crew?—I think they have seven.

11,707. That is larger by three than the crews of your boats?—No, we generally have seven.

11,708. You have as many as seven?—Yes.

11,709. (*Mr. Lefevre.*) Do you think they take a larger quantity of fish than you?—I don't know. I think it is likely that they do sometimes.

11,710. Have you seen the French working?—Yes, frequently.

11,711. Do they use two trawls?—No, only one.

11,712. Is it of the same make as yours?—About the same thing.

11,713. Is your share the same as that of the last witness?—No.

11,714. What is yours?—I get 14*s.* a week, and 1*s.* in the pound upon the vessel's earnings.

11,715. Has that been the same for the last 18 years?—Yes.

11,716. Do you find that you make pretty much the same earnings now that you did when you first began?—Yes, it is quite equal if not more; I think it is more.

11,717. Have you noticed any increase in the price of fish during that time or not?—I don't know much about the price of fish.

11,718. You can give us no idea whether the average price is the same?—No.

The witness withdrew.

G. Pellett.

GEORGE PELLETT called and examined.

11,719. (*Mr. Caird.*) You are the master of a trawling smack here?—Yes.

11,720. Have you been long in that capacity?—Twenty-five years.

11,721. Twenty-five years hailing from Yarmouth?—No, not from Yarmouth all the time; I hailed from London part of the time.

11,722. How long have you hailed from Yarmouth?—Four years from Yarmouth.

11,723. What is the size of your vessel?—Forty-nine tons.

11,724. What is the length of your beam?—Thirty-seven feet.

11,725. Have you ever had it of any other length?—Yes, I had it 36 feet.

GREAT YARMOUTH.

G. Pellett.

16 Nov. 1863.

11,726. Did you ever have it 40 feet?—No.

11,727. Do you find that 37 feet is a good length?—Yes, a very good length.

11,728. Does the size of the beam at all depend upon the size of the vessel?—If the vessel is large you are obliged to have a larger beam in order to work the trawl.

11,729. You have a beam to correspond with the length of your vessel?—Yes, in order to keep it clear of the stern when it it is drawn up.

11,730. Have you during all the time you mentioned fished on this coast?—Yes, generally speaking on this coast.

11,731. Where have you been fishing lately?—Off here and around the coast.

11,732. You fish off this coast 40 or 50 miles?—I have been fishing various lengths.

11,733. Have you been in the habit during most of these years of frequenting the principal fishing grounds between this and Holland?—Yes.

11,734. Have you fished off the Dogger Bank?—I have been on the Dogger.

11,735. Often?—Yes.

11,736. Have you ever been to the north of the Dogger?—No.

11,737. Have you ever gone to fish on the Yorkshire and Northumberland coast?—Yes, I have been along there, not fishing with the trawl but with the line.

11,738. Is that recently?—I have not been there for the last nine years.

11,739. Then during the time you have been a fisherman on the fishing grounds on this coast and between this coast and Holland and on the Dogger Bank, have you observed whether the take of fish has increased or diminished?—There are as many fish as ever there were.

11,740. You find that with your own boat you can get as many fish as formerly?—Yes, much more than in former years

11,741. Do you find that any particular ground has been fished out?—No.

11,742. You always expect to obtain fish on whatever ground you put down your trawl?—Yes, wherever there is smooth ground.

11,743. Wherever there is smooth ground you go with as great confidence as you ever did before?—Yes, just the same.

11,744. With the expectation of finding fish?—Yes.

11,745. Have you observed that the number of boats going to the same grounds has greatly increased—Yes.

11,746. Are there two boats for one now?—Yes.

11,747. They have more than doubled compared with what they were?—Yes.

11,748. Compared with 10 years ago?—No, not compared with 10 years ago.

11,749. How many years ago?—20 years ago.

11,750. At what time did the largest increase of boats take place?—I cannot say.

11,751. Has it been gradual?—The number has been gradually increasing.

11,752. Is it increasing now?—Yes.

11,753. Is it increasing every year?—Yes.

11,754. Does every boat seem to get as good a take as it did formerly?—Yes.

11,755. Then the quantity of fish taken altogether must have greatly increased?—Yes, it has increased. I think the more you disturb and pull the ground about the more fish there is.

11,756. You stated that you were a line fisherman formerly?—Yes.

11,757. How long did you practice that?—For nine years, I never put a trawl down.

11,758. You were a long-line fisherman?—Yes, I fished with the long-line, and with the hand-line too.

11,759. (*Mr. Lefevre.*) Where from?—From London.

11,760. (*Mr. Caird.*) As a line fisherman did you go out into the deep sea some distance from shore?—Yes.

18,761. Did you ever fish in the bays?—Never in the bays. I was always a deep-sea fisherman and never in-shore.

11,762. Did you ever find that the trawlers interfered with the lines of the long-line fishermen?—The trawl will not touch them; it will go over them.

11,763. I don't speak of the fouling of the line, but of the fact alleged by the line fishermen in the north with regard to the destruction of spawn and of young fish. They say that the quantity of fish has generally decreased. Did you hear that complaint made when you were a line fisherman?—No.

11,764. Have you observed the trawl-vessels working the trawls when you were a long-line fisherman?—Yes, I have seen them go over my lines.

11,765. When your lines were set?—Yes.

11,766. And they did not touch your lines?—No. They passed over the top. The lines were always close to the ground and the trawls would not touch them.

11,767. Have you ever seen them foul the lines and pull them up?—Never, I have seen them repeatedly go over them.

11,768. What is the length of the lines from end to end?—I cannot tell exactly. I have had out about 12 miles.

11,769. How many hooks on the line?—36 hooks on the line.

11,770. How many lines tied together?—I don't know.

11,771. How many miles would you cover altogether with one long-line?—Each line is 40 fathoms and we have two lines in a piece.

11,772. How many pieces are attached together when you set your lines?—Nine off the Dogger.

11,773. That will be 720 fathoms?—Yes.

11,774. Then your lines would be a mile in length altogether?—Do you mean they would be all a mile long.

11,775, Yes?—Yes, they would be twelve.

11,776. Twelve miles in length?—Yes.

11,777. How many hooks have you on each of these lines?—36 on a line. A line is 40 fathoms long and two lines are what we call a piece. I have been shooting 80 or 90 of these pieces.

11,778. Ninety pieces 80 fathoms long?—Yes.

11,779. That according to my computation would be about 6,500 hooks?—Most likely.

11,780. How long does it take to bait these hooks?—We bait them as we draw them up.

11,781. What quantity of bait would it take to bait such a length of line?—About four or five bushels of whelks.

11,782. Do you generally bait with whelks?—Yes.

11,783. What quantity of fish did you catch?—Sometimes we had a great haul and sometimes not so many.

11,784. Had you ever as many on an average as you would get in a haul of the trawl?—Yes, more.

11,785. On an average you would get more?—I have seen 100 score in a shot; I have got 20 score of cods in a shot.

11,786. What length of time would it take you to get your lines baited, set, and drawn up?—It generally takes us a day. That is our day's work.

11,787. It takes you a day then to go over the lines once?—Yes; we put them out two hours before daylight, and then, as soon as it comes daylight, we commence hauling them in. It takes us all day to get them in.

11,788. Does the cost of lines 12 miles in length exceed the cost of a trawl net?—Yes, they cost a very great deal more.

11,789. Would the cost attending them—the cost of bait—be greater than in the case of a trawler?—Oh yes.

11,790. Is it a more expensive mode of fishing than trawling?—Yes, much more expensive than trawling.

11,791. Is there greater hazard attending it in regard to the loss of your lines?—That depends upon circumstances. If you have your lines shot when there comes

on a gale of wind in all probability you will never see them more.

11,792. Do you never lose your trawl net?—Sometimes we do; sometimes we break the rope on the gunwale and lose the lot.

11,793. Taking the year's fishing, would it require more capital to conduct a fishing vessel with long-lines than a trawl-vessel with a trawl net?—Yes, considerably more.

11,794. The wages and material in every way would cost more?—Yes.

11,795. At the end of the season would you find that you have got more fish with a trawl net than with the long-lines?—Yes.

11,796. Then you think that trawl-fishing is more productive for the capital employed?—Yes.

11,797. (*Mr. Lefevre.*) Are there many long-line fishermen from Yarmouth now?—No.

11,798. Do you come across many of them between here and the Dutch coast?—No.

11,799. How are your wages paid; are you paid by share?—I have 14*s.*, and a per-centage of 1*s.* in the pound upon the earnings of the boat.

11,800. Do you find that your wages have diminished or increased since you have been master?—Very little. I don't see much difference.

11,801. Did you find, when you were a line fisherman, that your fish sold for a better price than fish caught by the trawl?—I never saw much difference. Sometimes they would, according to the market. Sometimes cod would sell better. Cods caught by the line would sometimes fetch a very high price, but it varied very much. Occasionally it would be very high and occasionally very low.

11,802. Was it an advantage to bring them on board alive?—Yes.

11,803. With the exception of the cod, did you find much difference?—No, none whatever.

The witness withdrew.

WILLIAM HOLT called and examined.

W. Holt.

11,807. (*Mr. Caird.*) You are the master of a Yarmouth trawler?—Yes.

11,808. Have you long been engaged as a fisherman here?—Yes, for 20 years.

11,809. Have you ever been a line fisherman?—No.

11,810. Have you ever had any experience at all except as a trawl fisherman?—That is all the experience I have had of fishing.

11,811. What is the size of your vessel?—44 tons.

11,812. What is the length of the beam of your trawl?—36 feet.

11,813. That seems to be the ordinary length here? Yes.

11,814. Are there any beams here that are 40 feet long?—Not that I know of.

11,815. Have they never been more than 36 or 37 feet?—I have worked a larger beam in the north.

11,816. But here you find 36 or 37 feet sufficient for your purpose?—Yes.

11,817. Would you object to have it larger?—Yes. The current in general where we work runs very strong, and when the wind falls light our nets would close. We could not keep them open, and for that reason we could not satisfactorily work a larger trawl.

11,818. Have the nets a tendency to close more in calm weather than in blowing weather?—Yes; the length of the net would fall down in drifting with the tide; it would not admit the fish to the net; they would not get to the far end, and the result would be that we would not catch them.

11,819. Would you not catch fish if the beam were much larger?—No.

11,820. In what kind of weather do you catch most fish?—In middling weather with two reefed sails.

11,821. At what rate would you drift?—About 3½ knots an hour, with the tide and all. The tide will take us about 2 or 2½ in most places where we fish, and the vessel would drift perhaps a knot or a knot and a half; we force them along. We don't like a dead drift, we prefer forcing the boats along with canvass.

11,822. You go faster than the tide?—We like to go faster than the tide. We go very little faster in catching soles, but when we are catching haddock and plaice we go rather faster.

11,823. Is there any means by which you can tell whether you are catching haddock or soles?—We can't tell until we heave up the net.

11,824. When you do that you know what rate you ought to go?—We make one haul, and according to what we find we work.

11,825. If you find haddocks and plaice you make more sail and go faster?—Yes.

11,826. But if you find you are catching soles you take in your sails and don't go so fast?—Yes, we go very easy in general.

11,827. Do you always fish with the tide?—Yes, as near as we can.

11,828. You take the same run as the tide?—Yes, as near as we can. The wind will not always allow us to do so; but the nigher we go to the run of the tide the greater benefit it is to us.

11,829. Do you ever fish against the tide?—We can't do that; the net would not go to the bottom. It lifts up. We can't fish against the tide.

11,830. How far off the shore do you generally go?—From 15 miles off here to the coast of Holland.

11,831. Are there particular seasons at which you fish on this side and at the other side?—We generally cleave to the shore on the other side in the middle of the summer, but the fish on this side is a good deal better in quality than on the Dutch coast. If we find it is not plentiful on this side, then we go to the other.

11,832. They are better in quality on this coast than on the Dutch coast?—Yes, where there is the heaviest tide the fish are always better.

11,833. Are they larger in size?—I don't know much about the size, but the more the ground is disturbed and cultivated the better the produce is that comes from it.

11,834. Do you mean that the fish are better fed?—Yes.

11,835. Are they firmer fish?—Yes.

11,836. Fatter fish?—Yes, they are kept in more constant exercise, and are not allowed to lie and grow dead and black.

11,837. Has your fishing not been better on the Dutch coast? Trawling has been constantly carried on there?—Yes, it is better now than it was 20 years ago.

11,838. Is that because the ground has been more fished?—I have no doubt of it.

11,839. Do you often fish among the Dutchmen?—Very frequently.

11,840. Do they come among you?—About 40 miles from the shore is the nearest they come. They dare not come any closer; their trawls are lighter than ours and would be pulled to pieces if they came on our rough ground here.

11,841. Their gear will not permit them to trawl nearer?—No.

11,842. Is the ground off the Dutch coast smoother than it is here?—Yes, it is very fine all along for 150 miles. It is very fine from the lower part of the Flemish banks down to Schelling and even below that. With the exception of a little place off the Texel it is smooth ground all the way.

11,843. Have you fished on the Dogger Bank?—I went there in the first part of my time, but I have not been there of late years. I was there about the time there were a great many fish caught in the Silver Pits.

GREAT YARMOUTH.

W. Holt.

16 Nov. 1863.

11,844. The Silver Pits are south of the Dogger?—Yes, betwixt that and the Well Bank.

11,845. Are there any grounds which you have been frequenting all the time you have been a fisherman that have shown signs of being fished out?—No.

11,846. No fishing bank has become exhausted of fish?—Not anywhere off here for 150 miles.

11,847. No bank has shown signs of diminution?—No; I take it that all of them have increased.

11,848. Do you ever come upon the long-line fishermen when you are trawling?—Very seldom; they don't come upon our grounds except outside the sands, and there we don't go with our trawls.

11,849. Do you bring up many fish in your trawl not fit to be sent to market in consequence of their being damaged, or being too small?—No; they are all market fish generally. We spoil very few. There is a small portion of small fish such as gurnets and dabs.

11,850. What is the largest quantity of fish you have caught in one haul?—About 40 packages.

11,851. Out of those 40 packages, what would be fit for the market?—The whole of them. Possibly we should not catch a basket of offal when we got these gluts of fish.

11,852. By "offal" you mean fish unfit for the market?—We call haddocks and plaice "offal."

11,853. Do you mean that you did not catch a basket of those?—No; what I meant was that when we fell in with that heavy glut of fish we did not get a basket of small fish.

11,854. Do you ever catch dog-fish?—Yes, lots of them; they are very tiresome to us—they prick our fingers in the dark. It is impossible for us to use lights, and we often feel them when we don't see them.

11,855. You throw them back again into the sea?—Yes, we throw them back again; some take the livers out.

11,856. (*Professor Huxley.*) Is it the piked dog-fish or the spotted dog-fish that you get?—There are two spurs on the back.

11,857. That is the piked dog-fish?—Yes.

11,858–9. Do you ever get the spotted?—Sometimes, in-shore.

11,860. (*Mr. Caird.*) Is there any other unmarketable fish you get in the trawl?—We get thornbacks and other fish sometimes which don't serve the market; they don't fetch much money.

11,861. Do you throw them back into the sea?—Yes, but we don't kill them.

11,862. You can't kill them?—We don't kill them; like men engaged in trawling they would stand a great deal of hardship.

11,863. (*Professor Huxley.*) Do you understand this chart of the North Sea?—Yes.

11,864. Will you point out to us any places you can't work on?—There are lots of places around and about the shores on the westernmost parts of the Well Bank.

11,865. That is in-shore?—No, it is a good way out at sea; on the chart we call these places the Well Bank. It was a bank to the southward of the Silver Pits extending as far as the Dudgeon to the westward, and as far as the White Bank to the eastward; but now we have the Well Bank defined on the chart where there never was any name some years ago.

11,866. Do you find it rough ground all the way to the English coast?—Yes.

11,867. And all the way to the Dutch coast there is smooth ground?—Yes.

11,868. Can you trawl away from the mouth of the channel right across to the Dutch coast?—We can trawl away in the latitude of the Galloper on smooth ground as low as the latitude of Cocquet Isle with safety, but we cannot trawl as far westerly.

11,869. How do you manage when you get off the Norwegian coast; do you ever go so far as that?—No; I am unacquainted with that coast.

11,870. What is the greatest depth you can conveniently trawl in?—In the pits we trawl in 50 fathoms; that is about the most. A few years ago when a number of soles were pulled out there they were all big fish. All the fish caught were big soles, and we were of opinion ourselves that the fish did not breed there in consequence of their being all big soles.

11,871. (*Mr. Lefevre.*) Has the quantity of fish fallen off in the Silver Pits?—I don't think those large soles are caught as they used to be, but there are a greater number of smacks to do the business. At the time I speak of there was not one belonging to Hull, but now they have over 300 sail.

11,872. Do you know the Fiskar Bank?—No.

11,873. There is nothing to prevent your trawling to the eastward of the Dogger Bank right away to the Dutch coast?—No; but we don't frequent that much. Mr. Hewett's vessels go there; he takes that part of the sea. There are many people who are fond of handling the fish, and seeing it is properly stowed away, before it is sent to market; and therefore we generally go to Yarmouth with our fish.

11,874. Have you ever been herring-fishing?—I went one voyage.

11,875. You are not a regular herring fisher?—No.

11,876. Have you been mackerel-fishing?—No.

11,877. Do you fall in with the Hull trawlers?—Yes, in the summer season.

11,878. Do they fish mostly to the northward?—Yes, barring about three months. They come as far as the Hook of Holland, but generally they fish to the northward.

11,879. Do you agree that there is enough fish for all of you?—Yes, I have four sons nearly qualified and I should like to have a vessel for each of them if I had money enough.

11,880. Then do you think it as good a trade as ever it was?—Yes, we have to work a little harder but we earn a little more money.

11,881. How long have you been master of a smack?—Well on for 20 years now. I tumbled into it curiously. I was a seaman before.

11,882. Do you think that as much money is made out of it now as there was then?—We work in heavier weather than we used to do and we pull more gear to pieces, but the fish must be more numerous than they were formerly, because when the first trawlers went out of Yarmouth there were only two smacks. If we live six or eight weeks longer we shall be able to muster 140 sail from Yarmouth alone.

11,883. Does that include Mr. Hewett's boats?—Not at all; he is a stranger, but as some of his vessels could not get home he came here to be handy on the spot.

11,884. There will be 140 vessels from Yarmouth without counting Mr. Hewett's?—Yes, I think there will after Christmas. If we be spared we shall then muster 140 sail.

11,885. All belonging to Yarmouth?—Yes.

11,886. And manned by Yarmouth men?—I suppose if the men can get the money there will be 30 or 40 more fitted out.

11,887. Are they all manned by Yarmouth men?—Yes, the greater part of them. I mean from here and round about the suburbs.

11,888. How many have you in your smack?—Eight.

11,889. How many of those are boys?—Four.

11,890. Are they apprentices?—I have one apprentice.

11,891. Do you take up many large stones with the trawl?—Yes, we have cleared the ground wonderfully since I have been trawling. I can show you some that you would think it impossible for any net to take up, now lying on the borders of Yarmouth Quay.

11,892. Do they do much damage to the fish?—They would if they got along with the fish. Of course they would mangle it a bit before it could be got on board.

11,893. Do you find that that is often the case?—Not now. We trawl now in safety, where 16 or 17 years ago we should have been sure to make a sacrifice if we put our nets down.

11,894. Have you noticed any difference in the price of fish since you came here?—I think sometimes we have a better sale.

11,895. Take the case of haddocks; do they sell for the same price or do they bring more money?—When I first went they were sometimes very low and I have known them at times fetch a great deal of money. In general they may fetch a little more than they did. I think the reason is that we have not so many lines to catch haddocks. They have left off line-fishing and taken to trawling. When I first went fishing in this capacity I think that Mr. Hewett had about 10 or 12 liners, but I don't think he has more than two or three now.

11,896. He told us he had five or six.—I did not think he had as many now.

11,897. The trawlers don't catch as large a proportion of haddocks as the line fishermen?—The haddocks the liners catch are more pure and clear. We mangle them a little and they don't look as well as the line fish at Billingsgate.

11,898. The line haddocks fetch more in the markets than yours?—I think they do.

11,899. Is that always the case with regard to other fish?—There are not many others caught with the line by which the men could make a living.

11,900. Do the line men catch soles?—Not many. Perhaps a chance one if he is hungry has a bite at the hook and gets nailed.

11,901. (*Mr. Caird.*) Have there been any line fishermen here in your time?—We had a few who went to Iceland, but they did so badly that they could not afford to go any more. We had also one vessel that went for haddocks a short distance from here, but she also gave it up from some cause or other.

11,902. In your own knowledge and experience have you ever seen line fishermen give up the line business and become trawlers?—Yes; the vessel I have just referred to is a trawler now.

11,903. (*Mr. Lefevre.*) Do you employ men who have been apprenticed to the trade?—Yes, hundreds of them. We have 700 men employed in trawling, and 20 years ago we had only seven or eight.

11,904. Is there any rule as to the number of apprentices?—No, there are a lot of apprentices now.

11,905. Is there a rule forbidding the employment of men who have not been apprenticed?—No, not here.

11,906. (*Mr. Caird.*) Are there many coast volunteers here?—No.

11,907. (*Mr. Lefevre.*) Did the 700 you mentioned include apprentices?—Yes; our owners have to find a lot of victuals for them.

11,908. Do many of the men go voyages during the year, and take to fishing only during a part of the year?—Some of them leave off trawling to go after herrings.

11,909. But do many go voyages?—Do you mean sailoring?

11,910. Yes?—Some do, but not many.

11,911. They mostly all of them confine themselves to the fishing?—Yes.

The witness withdrew.

Isaac Shuckford called and examined. *I. Shuckford*

11,912. (*Mr. Caird.*) Mr. Shuckford, you are connected with the herring-fishing here?—Yes.

11,913. More largely than with trawl-fishing?—I have about the same number of herring and mackerel vessels as I have of trawl-vessels.

11,914. Is the catch of herrings increasing or diminishing, taking your experience of some years back?—In my experience of something like 30 years I think there are more herrings on the coast now in this present year and last year than I ever knew; certainly more than I have known during the last 20 years.

11,915. In what months do you generally find the herring-fishing to be best here?—Generally from the early part of October until the latter end of November.

11,916. Two months?—Yes, the season lasts four months. We begin the herring-fishing in the early part of September, and we go on generally to near Christmas; but October and November are the two principal months for the heavy catches on this coast.

11,917. Is there any other season of the year except from September to Christmas that you catch herring here?—Yes, there is a season that has originated during the last eight or 10 years, called the spring herring catching. That begins sometimes in the latter part of February, and sometimes in the early part of March, and lasts until the later part of April. But that is a herring-fishing that I don't follow.

11,918. Is it not productive?—There are large quantities caught. Probably millions are caught, but they are unseasonable fish. There is not one of them that is not what we call a spent fish. They have no roes in them and they sell for very little money.

11,919. What is done with them?—They are sent to London and the manufacturing districts. A large portion of them is sold for manure for very little money indeed.

11,920. Are they salted, or are they sold fresh?—They will not bear salting.

11,921. Is there a very large quantity caught in the spring fishery?—Some years a very large quantity, but there have not been so many for the last one or two years. In point of fact, people have got tired of going to catch them, as they have frequently been sold as low as 3*d.* or 4*d.* a hundred. The farmers will buy these spring herrings for manure and give 3*d.* a hundred for them. They are comparatively worthless to them for that purpose, inasmuch as they have got no moisture in them.

11,922. Will they pay the carriage to the manufacturing towns?—Yes.

11,923. Are they sold there?—Yes.

11,924. Are they taken freely there for food?—There is a large quantity sold for very small prices.

11,925. Are they wholesome?—There is no flavour or quality in them; but I believe they are wholesome.

11,926. Is that a fishing that has been lately originated—has it not been long practised here?—It has certainly originated during the last 10 years.

11,927. There was no spring-fishing previous to 10 years ago?—Not to my knowledge.

11,928. Has it diminished the autumn fishery?—Not in the least.

11,929. Then whatever can be caught in the spring is so much addition to the food of the people if it can be eaten?—Yes.

11,930. No damage is done to the autumn fishery in consequence of catching these herrings in spring?—I believe not.

11,931. You find the autumn fishery quite as good?—Yes. We have another herring fishery here, which we call the midsummer herring fishery. That begins in the early part of June and continues for a month or five weeks. During the last seven years it has been quite a failure. We had a very large fishing for one or two years; but whether the spring herring fishery has had any effect upon it is more than I am able to say. I believe it has.

11,932. Are the fish in good condition at that time?—They are fish not curable for exportation; but if they are not kept beyond a certain number of days, as far as quality goes, they are about the most expensive and finest fish we catch during the year.

11,933. How long is it since that practice of midsummer-fishing began?—Not more than 10 or 12 years.

11,934. Then the spring and summer-fishing seem to have commenced together?—Pretty nearly together.

11,935. And you think the spring-fishing has damaged the summer-fishing?—Yes. I judge that there are millions of these herrings which are caught in the

GREAT YARMOUTH.

I. Shuckford.

16 Nov. 1863.

months of March and April. It is impossible to find one with any thing in the shape of a roe in it. They go on catching these herrings, and perhaps in the early part of May you may begin to see them becoming what we call half-full. They have a sort of gut in them apparently after that. We have what are apparently the same herrings with a larger gut in them; it is not exactly roe, but a fuller gut, and it gives a certain quality to the fish.

11,936. (*Professor Huxley.*) Is that what you call a "matey?"—Do you mean a melt?

11,937. No; I refer to a special term used by the Dutch. I presume that the gut you speak of is the fat gut?—Yes.

11,938. They are fat herrings?—Yes.

11,939. (*Mr. Caird.*) If the fish caught in the spring have no roe in them they are not likely to be fish that from being caught would diminish the supply in the summer?—I think they do.

11,940. Do you believe they would grow into summer fish?—I believe they would.

11,941. But by the spring fishery, except the fish actually caught, you don't appear to destroy the brood?—There is no evidence of that fact on this coast.

11,942. I suppose your autumn fishery is your valuable and great herring fishery here?—Yes, it is the principal fishery.

11,943. Is it a source of much revenue to the place?—Yes, a very large revenue.

11,944. Do you know how many boats are engaged in the herring fishery here?—About 300 or 400 out of this port. The Gorleston boats catch their fish on the same coast, and all belong to the same port. I should say there are 300 or 400 boats altogether.

11,945. How many men are there in each boat?—They range from nine to eleven, according to the size of the boat.

11,946. Are all these 300 or 400 boats engaged in the spring, summer, and autumn-fishing?—No; at at this place not one-fourth of them are engaged in the spring herring fishery.

11,947. Perhaps there are 100 in the spring-fishing?—Not so many as that. There are not more than 50, and they chiefly belong to Gorleston.

11,948. How many are there engaged in the summer-fishing?—The summer-fishing has latterly been such a failure that it has come down to the nominal number of 20 or 30 boats that follow it.

11,949. But there are 300 or 400 engaged in the autumn fishery?—Yes.

11,950. Therefore the autumn-fishing is really a fishing of great importance to you?—Yes.

11,951. Is there no return of any kind kept here by which we could ascertain the relative quantities of herring caught one year with another?—No, I think not.

11,952. There is no official return?—No.

11,953. Are the fisheries here not under any Government inspection the same as the Scotch fisheries?—There is no return kept.

11,954. Is there no return connected with the port from which you could ascertain the fact?—There is no return except from the Custom House, which would give you the export to the foreign market only.

11,955. Is there no Government brand placed upon the herrings here as in Scotland?—There is no such thing as in Scotland.

11,956. There is no Government officer who acts in the same way as in Scotland?—No.

11,957. Do you send your herrings to the same market that the Scotch do?—Decidedly not. Theirs are green fish; ours are all salted and smoked.

11,958. The Scotch fish are salted but not smoked?—Yes.

11,959. Yours are smoked but not put in barrels?—Yes, ours are put in barrels.

11,960. In what way are they sent to the market?—Principally they are salted on board the boats that catch them, and then they are brought ashore and salted again and placed on the floors of the curing houses and then hung up and smoked for 10 or 12 or 14 days. They are then put in barrels and shipped for exportation.

11,961. Are those fish what are called "red herrings"?—Yes.

11,962. They are not bloaters?—No, the bloaters will perhaps be hung up to-day and taken down to-morrow, and perhaps sent to London the same day. Yarmouth bloaters are usually not smoked more than from 12 to 18 hours.

11,963. In what proportion is the catch used as red herrings, and as bloaters, and as fresh fish?—I cannot tell you accurately. All these things would require a little calculation.

11,964. I don't mean accurately, but approximately?—I should say that one-fifth of the catch will be intended for exportation; perhaps one-fourth or one-fifth are exported.

11,965. You mean red herrings?—Yes.

11,966. Are the red herrings chiefly prepared for exportation?—Yes.

11,967. When you speak of exportation, do you mean exportation abroad or to the manufacturing towns?—I mean exportation abroad to foreign countries.

11,968. Is the principal part of the red herrings exported?—All that are cured here are exported.

11,969. They are not used in the home market?—No, they would not suit the home market.

11,970. Where are they sent to?—To the Italian markets.

11,971. To the Mediterranean?—Yes, chiefly to the Mediterranean, the Greek islands, and other places.

11,972. You say there is no brand of any kind upon them?—No.

11,973. Is there no mark so that the buyer can distinguish them as coming from a particular curer?—Yes, almost without exception every man's name is put on the barrel.

11,974. That forms what may be called your trade mark?—Yes. There will also be a number upon the barrel which tells more or less the quality of the fish. A barrel going out with my name may be marked 600. That would be worth more than a barrel marked 750.

11,975. Is that because the fish are of finer quality?—Yes.

11,976. Then do you think that a brand, showing the number of the fish is as good a test of the quality as a Government brand would be?—I am not in a position to speak of that.

11,977. You have never experienced in the market any loss because you had no Government brand?—That is a thing I cannot speak of.

11,978. Your fish never come into competition with branded fish?—No, because the Scotch fish are all green fish; they are all gutted.

11,979. Are your fish not gutted?—Certainly not, they are smoked herrings and nominally speaking we get none here that are gutted.

11,980. Is the gut not taken out of the smoked herring?—Oh dear no; certainly not.

11,981. Then what proportion do you suppose is sent in the shape of bloaters to the market?—Perhaps to the London market about one third of the catch.

11,992. Are bloaters the most remunerative to the fishermen?—They ought to be but it is not always the case. We always prefer the fish brought in, if the boats can bring them in, so that they can make bloaters; but bloaters are the same as anything else. When all the boats bring bloaters, and all have got a large quantity, however good they may be they sometimes go to London and overstock the market.

11,983. Are bloaters selected fish?—You can make a bloater of anything, but generally speaking they are selected fish.

11,984. Is there any particular season for bloaters?—We make bloaters all the season.

11,985. All the autumn season?—Yes, during all the common season up to Christmas, but they are

generally considered best in October, and in the early part of November.

11,986. Are not bloaters made from spring or summer fish ?—They are smoked and sent up as bloaters. In fact there is no other means of doing anything with spring herrings, except salting them one day, hanging them up the next, and sending them off to market on the third. But spring herrings are nearly all poor fish and sold for manure.

11,987. Are some of the fishermen engaged in the herring season engaged at other seasons in trawl-fishing ?—Some of the men who follow herring-fishing are trawlers when they are not herring-fishing ; is that what you mean ?

11,988. Yes.—Some of them are, but they are not as a rule.

11,989. What do they do at the time there is no herring fishing ?—A certain number of fishermen attend the beach and work at bringing the fish ashore from the smacks. They are also on the look out for salvage cases. The principal portion of them come from Caistor, Winterton, and Hasborough and they go home after the season is over. Some of them, who are called "capstan men," are a low class of men so far as payment goes.

11,990. There seems to be a larger number engaged in the herring-fishing than in trawling ?—Yes, three times the number.

11,991. During the season of the year that the herring fishing is not carried on, do any of these men fish mackerel, or any other kind of fish ?—Yes, there are some.

11,992. Some men follow the mackerel-fishing ?—Yes.

11,993. When does it begin ?—It is a summer-fishing. From the 10th to 15th of May up to the 20th of July.

11,994. So that there is continuous work for them from May to Christmas ?—Yes.

11,995. The slack time is from Christmas to May? —Yes.

11,996. Have the wages of the fishermen increased here ?—The wages of the fishermen, as a rule, have been pretty much the same during the 25 or 30 years I have been connected with the business. Some 8, 10, or 12 years ago the seasons were so dreadfully bad that the fishermen's wages were reduced perhaps 15 per cent.

11,997. Are the fishermen paid wages exclusively or have they an interest in the catch of the boats ?—There has been a new class of boats during the last five or six years called "half-and-half" boats. They are not as large as the other boats. They fish by share, but the old standards all fish by wages. Whether the fish are worth 10*l.* a last or only 3*l.* the men get the same for catching them.

11,998. They have no interest in the catch ?—No.

11,999. They have no per-centage on the catch ?—No.

11,999*a*. (*Mr. Lefevre.*) They are paid so much per last ?—Yes.

12,000. (*Mr. Caird.*) Are they paid a fixed price per last ?—Yes.

12,001. Then they are paid according to the quantity caught ?—Yes, but not according to what the fish brings.

12,002. Then they have an interest in catching a large quantity ?—Yes.

12,003. Their wages depend upon their own exertions ?—Yes, to some extent.

12,004. Then the wages they earn would be some test as to the increase or diminution in the catch ?—Yes.

12,005. Has the condition of the herring fishermen, compared with former years, improved, or has it fallen off ?—Are you speaking of the remuneration of the men ?

12,006. Yes, the men who are paid by the last.—Some 10 or 12 years ago the men's wages were reduced in consequence of the seasons being so bad.

12,007. That is to say the price per last was reduced ?—Yes, something like 15 per cent. ; but after that had gone on for three years certain circumstances arose, and the men made something like a stand and obtained their old wages again.

12,008. Has it continued so ever since ?—Yes, up to the present season, when in consequence of the seasons having been so bad for the last few years they agreed to go for something like 15 per cent. less than they have had for the last five or six years.

12,009. (*Mr. Lefevre.*) What is the payment per last ?—The average payment per last is about three guineas for men's wages.

12,010. (*Mr. Caird.*) Is the quantity they are catching now greater than it used to be ?—The quantity they have caught this year is beyond the average catch.

12,011. Do the French herring boats come here at all ?—Not very near the coast; but as far as the fishing is concerned, I am not a practical fisherman and can't say where they come.

12,012. Do they interfere injuriously with your fishing ?—Not much on this coast.

12,013. Do your fishermen complain of it ?—They have done so when they have had to go in the early part of September to fish down in the Silver Pits and towards Flamborough Head. There they have come into contact with the French fishermen, and have got into great disputes, but who is most in fault I cannot say. All I can say is that the French boats are much larger, that they carry a much larger number of hands, and that they shoot so many more nets that whenever they happen to come into contact our people are sure to get the worst of it.

12,014. Are your herring boats decked boats ?—Yes, they are all decked boats.

12,015. Do they keep the sea in rough weather ?—Yes.

12,016. They do keep the sea ?—Yes, many of them are the same class of boats as the trawlers, and after the herring season is over they are capable of being converted into trawl-vessels, and they go trawling in the winter.

12,017. Have you ever heard any complaint that the Government have sent no protection against the fishermen coming among the herring nets ?—I have heard a great deal of complaint on the part of fishermen fishing abreast of the Humber, off Flamborough Head.

12,018. Your chief take of herrings is off Flamborough Head, is it not ?—We get a considerable quantity when we first go to sea, from the middle of September till the 10th of October, off the Yorkshire coast, but the boats subsequently come south. We have no herrings on our coast at that time of the year, after the season is over there our boats work up to Yarmouth.

12,019. Do the herrings work up ?—We find them here then.

12,020. But they may be different shoals ?—Yes.

12,021. Do not the French boats follow them further south ?—We do not find them come so much in contact after that.

12,022. Do you catch much of your herrings three miles from the shore ?—No; a few boats go and fish off the shore with a small number of nets, but very few.

12,023. Then that forms an inconsiderable portion of your take ?—It is quite nominal ; it only lasts for some seven or eight or ten days, or on a chance time for a fortnight ; but the herrings taken in that way don't form one per cent. of the general take or catch.

12,024. (*Professor Huxley.*) You have been speaking of the spring-fishing ?—Yes.

12,025. I think you stated that it began in February ? —I am not particular as to the exact time it begins, but it generally begins about the latter part of February or the early part of March.

12,026. Are herrings ever seen here in January ; is there an appearance of herrings here then ?—There is no general appearance then, but I believe if the boats went off after them they would get herrings, though only a small quantity.

12,027. What is the average size of the fish caught

GREAT YARMOUTH.

I. Shuckford.

16 Nov. 1863.

in the spring-fishing? Is it as large as the autumn herring?—No; however many millions may be caught during the months of March or April I have never seen a proper herring among them.

12,028. They are not full-sized herrings?—No, they are not full of roe or milt.

12,029. How many go to the barrel?—About 900 or 1,000.

12,030. Whereas your full-sized herrings go about 600 to the barrel?—Yes, about 600.

12,031. Have you ever seen a full herring among the spring herrings?—Never in the early part of March or April.

12,032. Did you ever see one in February?—No.

12,033. Did you ever see spent fish then?—They are all spent fish then.

12,034. Are they spent or are they not full?—I can't answer that. We call them shotten or spent fish.

12,035. They are not the same as you get here in November?—No, they are not as large.

12,036. Are they fat inside?—No, they have neither fat nor moisture. One proof of this is that even the farmer who buys them for manure will not give half the price for the same weight or quantity as he would give for any offal fish, because they have no oil or grease or moisture in them.

12,037. What kind of net are those spring fish caught with?—They ought to be caught with the same net we fish with in the midsummer-fishing; but whether they are or not I don'tknow. I cannot speak from experience, but I have heard that they are caught with nets that run 37, 38, 39, and 40 meshes to the yard. If that is so all these nets are seizable.

12,038. What is the size of the nets you use?—My herring nets are all braided about 31 to 31½ to the yard, but by the time they go through the different processes of barking and being rendered fit for sea, they will be 32½, and by the time they have got worn out they will become 34 to 34½.

12,039. Do you ever use them 36 to the yard?—I never braided anything over 31 to 31½, and in my experience I never noticed them becoming more than 34 or 34½.

12,040. Why do you use them of that particular size rather than any other?—If we had them of a larger size the effect would be that they would not catch fish; if we had them of a smaller size we should get nothing but small fish of which we could make nothing.

12,041. Are you aware of any regulations on the subject?—My impression is that no herring net should be less than 36 to the yard, or an inch from knot to knot on the line.

12,042. Is there any officer to examine your nets here?—No.

12,043. Did you ever know of any nets being seized?—No.

12,044. Nobody takes any trouble about it?—No; because one man has no desire to do another man an injury; but I think there should be a man sent by Government, or some one placed here in authority to see that nets of an illegal mesh are not fished with.

12,045. Is there a Revenue cutter here?—Yes.

12,046. Does she ever overhaul the nets?—I never heard of such a thing.

12,047. (*Mr. Lefevre.*) Is there any Government steamer stationed off here to look after the fisheries?—Not that I am aware of.

12,048. (*Professor Huxley.*) If the mesh of the spring net does not run closer than 37 or 38 it will not catch very small fish?—Yes, it makes a great difference when the meshes are even only one or one and a half closer. That makes a considerable difference in the catch of herrings.

12,049. Are the fish at that time in large shoals?—Sometimes they are in very large shoals. More spring herring-fishing is carried on at Lowestoft than here. I have seen 100 lasts brought in and sold for 3*d.*, 3½*d.*, or 4*d.* a hundred, when we give our men in the proper season 9*d.* a hundred for catching them.

12,050. Where do these herrings go inland. They go in large quantities to Manchester, Birmingham, London, and Liverpool.

12,051. Do you think the poor people are very glad to get them? A man who has nothing but potatoes to eat will be glad of herrings?—I don't say he will not, but I think many thousands of them are of such a quality that even the lower classes after eating a few of them would care very little about herrings.

12,052. You mentioned just now that you did not consider that your spring herring-fishing injured your autumn-fishing?—No, there has been no appearance of it.

12,053. When there has been a large spring-fishing at Lowestoft has there been a falling off in the autumn-fishing here?—I never noticed it.

12,054. The fish you are catching now are full of roe and milt?—Generally speaking they are, but we have now come to the time of the year when we expect to get a certain portion of them spent.

12,055. They are either full or spent?—Yes.

12,056. Do you ever catch herrings here in August?—No.

12,057. Is that because it is not the practice to catch them, or because they are not here?—Because the fish are not on the coast.

12,058. What is about the average tonnage of your herring boats?—In speaking of the tonnage of the herring boats there is very much difference in regard to the way you take it, whether according to the old measurement or the new. Upon what we call builders' measurement the average tonnage of my boats is from 55 to 60 tons.

12,059. Is that fully as large as the tonnage of the trawling vessels?—It is as large as the tonnage of many of them.

12,060. There are as many as 400 of those boats here?—There are somewhere between 300 and 400 boats belonging to the port, but they are not all of that size. Perhaps one half of them will be of a class that run 10 tons below that.

12,061. What is the depth of your nets?—Do you mean of the herring nets?

12,062. Yes, how many fathoms deep are they?—They are 200 meshes deep.

12,063. How long are the head lines?—The cork ropes?

12,064. No, the nossels?—About 15 or 16 inches.

12,065. Not more than that?—No.

12,166. Then you float your nets very near the top of the water?—We float them or sink them according as we cork them.

12,067. But don't you regulate your depth by those lines?—No, the seizings regulate the depth.

12,068. What do you call "seizings"?—It is a line 7 or 8 yards long. There are two on each rope, and they keep the nets from breaking away in strong weather. They are from 1¼ to 1¾ inches in circumference. There are two on each herring net made fast to the warp. If strong weather comes on there would not be sufficient stamina in the rope to resist it; it would break away if it were not for these seizings.

12,069. Do you let your warp swim on the water?—I think not, but I am not a practical fisherman enough to say.

12,070. What is the length of the fleet of nets in one of your boats?—Perhaps as a general rule a little over a mile, say a mile and a quarter.

12,071. What will a herring boat with all its fittings cost, supposing you had to fit one up ready for sea?—If a man desired to have one or two boats he would hardly fit one up for the herring-fishing alone; he would fit her up for both the herring and mackerel-fishing. If he fitted her up expressly for the herring-fishing, a boat with nets and warp would cost 1,200*l.* or 1,300*l.*

12,072. Then the fittings of a herring boat would cost a great deal more than the fittings of a trawler?—Yes, because it is not only the nets she actually shoots, but to carry her over the season she must have three or four sets. If she has three, she will use one

of them in a month. The first that goes out of trim can be repaired by the time the third requires replacing, and thus she will be enabled with three sets actually to fish four sets in the season.

12,073. Is there any kind of capstan for hauling the nets on board?—Yes, the boats have a capstan.

12,074. How many men have you on board?—Eleven.

12,075. How often do you haul the nets up?—Generally speaking, they are hauled up only once a night.

12,076. Have you any regulations with regard to shooting your nets before sunset?—Not that I am aware of, but that is a matter I cannot speak to, as I am not a fisherman.

12,077. Then with regard to the mackerel-fishing, how is that managed; is it carried on by hookers?—No, by nets.

12,078. You practice drift-net mackerel-fishing?—Yes, with nets of a different mesh.

12,079. What is the size of the mesh of your mackerel net?—From 24 to 25½ in. the yard.

12,080. Do you use the same length of net?—The mackerel nets are not as deep in the water, but a mackerel fleet will reach 2½ miles.

12,081. You fit up your boats for the mackerel and herring-fishing?—Yes.

12,082. What does it cost for both?—Something like 1,500*l.* or 1,600*l.* The same warps will do for both, but you will want double the quantity.

12,083. In what condition are the mackerel at that time of the year; are they full fish?—When our boats first go to sea they sometimes get a few mackerel that are not full-roed. The last week or ten days before they finish the same thing will occur, but as a general rule they are always full.

12,084. (*Mr. Lefevre.*) How long have you been here engaged in the trade?—30 years.

12,085. Have you observed any increase in the number of boats engaged in the herring trade during that time?—Yes, as far as this port goes; taking 20 years since there are two-fifths, or double the boats now compared with what there was formerly. The increase originated principally with what we call half-and half boats which fish in closer to the shore.

12,086. Has the quantity of nets used increased in that time?—The quantity of nets has much increased because the number of the boats has much increased.

12,087. But I mean the size of the nets used by each boat?—About 14 years ago the length of the herring net used to be 14 yards to the rope; at the present time it is about 17 yards.

12,088. Then that is about the proportion they have increased?—That is the increase in the length of each net.

12,089. Has the average take of each boat increased?—Do you mean in the herring fishery.

12,090. Yes?—I think the takes on this coast have been more than they have ever been known for many years.

12,091. Is there any means of ascertaining the quantity of fish that is sent from Yarmouth?—Do you mean sent off by rail?

12,092. Yes?—I should think about 20,000 tons a year from here to the London market.

12,093. Do you think we can ascertain the quantity sent off accurately?—It is possible, but I am not certain.

12,094. Is a large quantity of the fish sent by vessels from Yarmouth?—Not sent from Yarmouth direct by vessels.

12,095. Not a large proportion of the whole take?—No, not to the London market.

12,096. But for foreign ports?—For foreign ports the quantity sent away is considerable, some years ranging from 50,000 to 60,000 barrels, each barrel containing 600 or 700 fish.

12,097. Is there any means of ascertaining the number sent to foreign ports?—That could be got from the port dues. I think the officers here have the numbers.

12,098. Do you think the midsummer herring is the same as the spring herring?—My impression is that the spring herring would come to be a midsummer herring.

12,099. You don't think that the autumn herring is the same as the midsummer or spring herring?—I don't know.

12,100. You have not observed that a decrease of the spring herrings has been followed by a decrease of the autumn herrings?—No.

12,101. How late does the autumn-fishing go on?—As near Christmas as possible; within a week or ten days, and sometimes within two or three days.

12,102. (*Professor Huxley.*) You mentioned that you never found summer herrings full?—Not with roe or milt, but I have found them with fat gut.

12,103. They must get full some time or other?—Possibly they may get full in the autumn or winter, but my experience does not allow me to give an opinion upon that.

12,103*a*. How far do the Yarmouth herring boats go to the north?—Sometimes as far north as Scarborough—as a general rule between Scarborough and Whitby is as far north as they go.

12,104. Is there any sprat-fishing here?—Very little indeed; I believe there is a sprat fishery at Pakefield and Lowestoft, but I am not aware that there is any here.

12,105. (*Mr. Caird.*) Are there any shell-fish caught here?—No.

12,106. Neither lobsters, crabs, nor oysters?—No. As a rule there is nothing worthy of the name nearer than Cromer.

12,107. Do you desire any Government interference to regulate the herring fishery?—I think we ought to have Government interference, to see that no nets are fished with of an illegal sheal. They catch the herrings before they come to maturity; but if I saw 10 men using illegal nets, and although I knew it was unjustifiable and wrong both to the trade and themselves to do so, I would not interfere.

12,108. Do you think there are any of these illegal nets here?—I do.

12,109. Is it not the result that they catch fish of a less marketable quality?—Decidedly they do.

12,110. Surely that would not pay them as well?—It don't pay them, but still it takes place at a time of the year when they have no other particular employment to follow.

12,111. Do they not fish with those nets in the autumn fishery?—No.

12,112. Only in the spring fishery?—Yes.

12,113. Have you never seen a small meshed net used in the autumn?—No.

12,114. Then you think the fishermen's own interest guides them in using a legal net in the autumn?—Yes, they catch sizeable fish.

12,115. It would not be for their interest to use a smaller mesh?—No.

12,116. Is there any other point on which you desire Government interference?—No.

12,117. Not as to shooting the herring nets before sunset?—No, I think not.

12,118. There is no regulation that you think would be beneficial to the fishing generally?—I am not practical man enough to speak on that point. I never have been fishing; I am only an owner of boats.

12,119. Are we to gather from what you say that the spring fishery ought to be put a stop to altogether?—That is my feeling in the matter.

12,120. Would not public loss result from that?—I think not.

12,121. Do you think you would get in summer what are now caught in spring?—I think we should get more in midsummer. I think the spring herring-fishing has this effect—it prevents hundreds of lasts of herrings caught in the autumn from being eaten. People get so thoroughly sick of the spring herrings that they don't care to touch them for a long time to come.

12,122. Do you sometimes find difficulty in getting

GREAT YARMOUTH.

I. Shuckford.

16 Nov. 1863.

your fish disposed of?—Yes, we have had great difficulty this year.

12,123. Is there a glut in the market?—They have been selling at such prices that there has been an immense loss to us catchers.

12,124. Is that on account of the large catch?—Yes.

12,125. In what market has that glut taken place?—In every market in the kingdom.

12,126. Do you find it in Manchester, where many of the operatives are out of work, or in the Lancashire markets generally, where the operatives are in such distress?—It is not confined to the Lancashire markets. Whether the fish is sent to Manchester, Plymouth, Birmingham, or Cornwall, we find the whole of the markets are packed.

12,127. Then it is the case that there has been a large catch of fish universally?—Yes.

12,128. (*Mr. Lefevre.*) What is the price they are fetching now per last?—My boats since they have been at sea have caught 500 lasts and more. If they had been put up to public sale they would not have averaged 6*l.* a last during the season, and many times I have had large quantities of which I have not made more than 3*l.* 10*s.* or 4*l.* a last. I feel convinced, that in an extreme case, I have not made more than 6*l.* or 7*l.* a last.

12,129. What do they cost you in wages per last?—Each boat must get 60 or 70 lasts and realise about 10*l.* a last to keep me clear of loss.

12,130. How many boats have you?—I have nine drift-fishing boats.

12,131. (*Mr. Caird.*) Have you observed in former seasons that the fishing after a warm summer was better or worse than after a cold summer?—I have not observed that as far as quantity goes.

12,132. Is it affected by the temperature of the atmosphere in the summer which no doubt has its effect on the sea?—I think not. I always find when the water is warm in the early part of the year that the fish are not as good in quality.

12,133. Have you ever noticed any seasonable difference with regard to the catch of fish? This year, for instance, there has been a large catch of fish, and every market has been glutted. Have you ever noticed that before?—I am not at all aware that the atmosphere or weather in the summer, whether it is warmer or colder, has anything to do with it.

12,134. But you know as a fact that there has been a large catch this year?—Yes; we had a large catch last year also.

12,135. You had a large catch last year?—Yes, there was not a glut but there was a large catch of fish. With the large catch of fish and the large number of vessels the effect is that this year a greater number of fish has been caught than can be sold with profit to the catcher.

12,136. Are you acquainted with the prices of fish at the large consuming markets in the country?—I send to all of them.

12,136. What is one of the principal markets you send to?—Leeds.

12,138. Is the price of fish lower than it was last year at Leeds?—Yes.

12,139. What other markets do you send to?—Manchester.

12,140. Is the price much lower there?—Yes, it is.

12,141. Is it lower than at Leeds?—I can't say whether it is or not, but taking the season throughout the prices have been very low, much lower than ever I knew them.

12,142. But is the price lower at Manchester than at Leeds?—No, I don't know that there is much difference.

12,143. I suppose the markets are very much regulated by each other? You would not supply Manchester at a lower price than Leeds? If you got more at Leeds you would send them there, would you not?—Yes, practically speaking, the market for fish with regard to prices is like corn.

12,144. It finds it level at once?—Yes.

12,145. Do you send more to Manchester than to Birmingham or Leeds?—We send large quantities to all the markets.

12,146. Which are the largest consuming markets?—With the exception of London, which is the principal, the largest are Manchester, Birmingham, and Liverpool.

12,147. For herrings?—Yes.

12,148. In all those markets is the price considerably lower than it has been on the average?—It is lower than I have known it.

12,149. Much lower?—Yes.

12,150. What would be the average price; what measure do you sell by?—In the London market we sell by boxes containing 180 or 200. They generally sell at so much a 100.

12,151. What would be the average price of 100 herrings in the manufacturing towns during the last five years?—That would be very difficult to say, but I have no hesitation in saying that the average price of herrings in the London market this year is 50 per cent. lower than it was five years ago.

12,152. Is it the same in all the large consuming towns?—Yes.

12,153. Is it 50 per cent. lower than it was last year?—I believe it is fully 50 per cent. lower than it was last year.

12,154. When did that material decrease first begin?—Last year there was a large catch, and we felt a depreciation in our business, but this year the price has been much less than last year.

12,155. Is that to be attributed to the large catch of fish?—Yes.

12,156. It is solely attributable to the large catch of fish?—Yes.

12,157. The greater supply thrown into the market?—Yes.

12,158. (*Mr. Lefevre.*) What wages do you pay per last?—Our wages come to about three guineas per last.

12,159. What price must you realise in order to make it pay?—The price we must realise depends upon the quantity the boats catch during the season. It will take 10*l.* a last and 60 or 70 lasts to clear us.

12,160. (*Professor Huxley.*) That clears the wages of all the men?—Yes.

The witness withdrew.

R. Martin.

ROBERT MARTIN called and examined.

12,161. (*Mr. Caird.*) You are a herring fisherman?—Yes, I have been so.

12,162. Have you been long a herring fisherman here?—Yes.

12,163. For how many years?—Over 30.

12,164. Are you still engaged in that business?—Yes, but I have not been fishing this season.

12,165. What size of vessel have you been in the habit of fishing with?—From 50 to 60 tons.

12,166. Is that a decked vessel?—Yes.

12,167. About the same as a trawl-vessel?—Yes.

12,168. Having heard the evidence of the previous witness, do you agree with him with regard to there being three seasons here for herring-fishing, the spring season, the summer season, and the autumn season?—Yes.

12,169. Do you find that the fish are poor in the spring season?—Yes, very poor indeed; in fact, they are quite young fish that have not come to maturity at all.

12,170. Do you think that the spring-fishing has to any great extent injured the summer catch?—Yes, it has, and the mackerel catch also.

12,171. Why?—Because the spring herring nets stop the fish. The mackerel just get their nose against the net and they lie against it. There they

die and rot away. If they only get their nose against the net they lose all their strength and rot away.

12,172. You think that they die ?—Yes.

12,173. And they are lost entirely ?—Yes.

12,174. Have you yourself practised the spring herring-fishing ?—I was never a spring herring catcher in my life.

12,175. Do they use a small net for it ?—Yes.

12,176. Universally ?—Yes, they are a great deal smaller than the nets used in the autumn-fishing.

12,177. Have you noticed that the summer-fishing has decreased lately ?—Yes, a great deal.

12,178. Do you attribute that to the spring-fishing ?—Yes.

12,179. Has the mackerel-fishing become less also ?—Yes, a great deal less, we have got no fish at all these last few years.

12,180. Do you agree with the previous witness that the autumn-fishing is as good as ever it was ?—Yes, quite equal.

12,181. It has not been affected at all ?—No, only the summer-fishing.

12,182. Do you think that they are the same shoals of fish ?—No, they are different altogether ; they are young fish.

12,183. Are they caught on the same fishing grounds ?—Yes.

12,184. You begin your early fishing in September further north ?—Yes, and we come further south as the season advances.

12,185. Where are the herrings caught now ?—About 20 miles from here, some of them 30 miles.

12,186. North, or what ?—About north-east from Yarmouth.

12,187. (*Mr. Lefevre.*) At what distance from the land ?—Perhaps some of them may be caught not more than 15 miles off. Some are caught just over Smith's Knoll. That is a great fishing place that we reckon upon.

12,188. (*Mr. Caird.*) How long do you keep at sea herring-fishing without coming ashore ? — That will depend on the fish we get ; sometimes we come in next day, sometimes we are out for three or four days. It all depends on the fish.

12,189. On the quantity of fish you can stow ?—Yes.

12,190. If you are two or three days at sea, do you salt them ?—Yes.

12,191. Do you salt them in bulk or in barrel ?—In bulk. We have a place to put them in.

12,192. Do you sprinkle the salt over them ?—Yes, and turn them over and sprinkle them again.

12,193. Do you gut the fish ?—No.

12,194. You just throw the salt over them ?—Yes.

12,195. Then it it is a very simple process ?—Yes.

12,196. What is done with the fish afterwards ?—They are brought ashore, and if they are fresh they are taken up for bloaters.

12,197-8. Is anything further done with them ?—They are cured and sent to the market.

12,199. Are they smoked ?—Yes.

12,200. Are they split open ?—No ; they are hung up on spits run through their gills.

12,201. What are they smoked over ?—Oak billets. They are hung up about as high as the ceiling of this room over the fire, perhaps 20 or 28 feet off. There are what we call "loves" of wood to hang them on.

12,202. Then there are fires to hang them over ?—Yes.

12,202*a*. How long do you hang them ?—If they are intended for bloaters from about a dozen to 14 or 18 hours.

12,203. And how long for red herrings ?—From three weeks to a month for a red herring.

12.204. Then they would be partly cooked would they not ?—Yes, they would be smoked quite through ; they are quite as red inside as out with the smoke.

12,205. Has the price of herrings of that sort increased of late years ?—I think it has increased.

12,206. Has the price of the herring prepared for export increased ?—Yes ; there was an increase some three or four years ago.

12,207. Is it higher now ?—No ; it is lower now.

12,208. Is the largest proportion of the herrings caught here cured in that way and sent abroad ?—Yes.

12,209. More are sent in that way abroad than are sent to the great markets of the country ?—Yes.

12,210. You have yourself been in a herring house and have seen the process ?—Yes.

12,211. You understand the business ?—Yes. I have been working at it personally when I have been at home in the winter time.

12,212. (*Professor Huxley.*) You have never been engaged in the spring-fishing yourself ?—Never.

12,213. Do the fish ever remain on this coast until January ?—Yes.

12,214. You find them in January ?—Yes.

12,215. What kind of herring are they then ?—In January they are what we call shotten.

12,216. Spent herring ?—Yes ; they do not go after them till the latter part of February or the beginning of March.

12,217. But you think herring are here ?—Yes, of course they are here but we think they are quite young fish with no roe in them.

12,218. They are not spent fish in the same sense that the fish you are getting now will soon be spent ?—No, those we have now run larger.

12,219. Is there only one time of the year at which you get full fish ?—Yes, only one time of the year.

12,220. Do you know where the herrings spawn ?—We always think they draw into the shallow water where they spawn.

12,221. That is where you find great quantities of them ?—Yes, always in shoal water.

12,222. Have you been fishing this season ?—No.

12,223. Do you see the fish brought in now ?—Yes.

12,224. Are they full fish ?—Some portions of them are spent fish.

12,225. Already ?—Yes ; perhaps some boats will have all full fish and some will have a few spent.

12,226. I understand you to say that the mackerel-fishing has fallen off ?—Yes, a great deal indeed during these last three or four years.

12,227. Do you attribute that to any other cause than the one you have mentioned ?—We fancy that that is a great hindrance to us.

12,228. Do you think it is altogether that ?—Yes.

12,229. That has caused the falling off ?—Yes.

12,230. Do you think the mackerel come in the same quantities that they did formerly ?—No, they do not. I think they kill them off before we can go after them.

12,231. Did you ever see them killed off ?—They catch plenty of small mackerel now. We see them bring them in ; sometimes they will have such a thing as 1,200 or 1,500 small mackerel. We know that the taking of that fish must be injurious to us because they are hardly fit to eat.

12,232. In one shape or another you get mackerel and herring all the year round pretty nearly ?—Yes, we go in the first part of the year after mackerel.

12,233. What becomes of the mackerel after July or thereabouts ?—We do not think they stir far from the coast. Where the spawn is there the fish is sure to be.

12,234. (*Mr. Lefevre.*) Do you fall in with the French boats in the autumn season ?—Yes, plenty of them.

12,235. Here ?—No, further out.

12,236. Further north ?—In the North Sea, off the Humber. Sometimes there are more of them than of our own boats.

12,237. They do not follow you down ?—No, when we come here they go away to the Foreland.

12,238. Do they go back to France ?—Yes, when they get their fish. They are now fishing off the Foreland.

12,239. Do you have any trouble with them ?—Plenty of it.

GREAT YARMOUTH.

R. Martin.

16 Nov. 1863.

12,240. Is there anybody to look after them?—You cannot make them honest. If they approach near you you are obliged to haul your nets in; they will not haul in theirs.

12,241. Is there any French Government steamer to look after them?—Not often here, but there is off the Scotch coast where they fish close upon the rocks.

12,242. But there is none off this coast?—I have never seen one during all the years I have been fishing.

12,243. Is there any English Government steamer employed?—I believe there has been one boat, but I have not seen it.

12,244. Do you fish within 3 miles off the coast or outside?—We do not fish nearer than 8 miles.

12,245. The French boats are larger than yours?—Yes, some of them have 30 or 40 people on board of them.

12,246. Do you think it would much assist you if you had a Government steamer to look after you?—I think it would; in fact they destroy our nets a good deal. They put their nets in among us and then our fishing is at an end. They will pull all our nets to pieces if we do not get them in.

12,247. Do they observe any rules as to shooting their nets before sunset?—No, they generally shoot them just before sundown. We do the same. Just as the sun is going down we get our nets overboard if we can.

12,248. What is the size of your mesh?—When the nets are new the mesh is about 31 or 31½ inches to the yard.

12,249. Are there any boats that use a smaller mesh?—None that are Yarmouth boats, but the spring boats do.

12,250. None of the boats engaged in the autumn-fishing do?—No.

12,251. Is there any Government official that overhauls your nets occasionally?—I never had anybody overhaul mine.

12,252. Do you know of any case in the autumn-fishing in which a smaller mesh has been used than that you have mentioned?—No, we generally all use the same. I believe they come principally from one manufacturing place. Many of them come from Bridport.

12,253. Where do you think the herrings spawn off this coast?—Just off the shore.

12,254. In-shore?—Just off the shore against the Knoll, and any way where there is a lee. That is generally where we find them. We find many spent fish about 12, or 14, or 15 miles from the land.

12,255. Do you catch any large number of spent fish late in the year?—We have not caught any large number yet.

12,256. Do you find them further off the shore than full fish?—They are generally inside, about 12 or 15 miles from the land.

12,257. Do you mean outside or inside?—I mean towards Lowestoft or Yarmouth. They fetch a smaller price than other fish. Sometimes they bring a mere nothing, about 3*l.* or 4*l.* a last. I have seen them sold for 50*s.* That was on account of the bad market.

12,258. Are you captain of a herring boat?—I have one boat of my own, and I have been engaged in the fishing until this year myself.

12,259. Do you pay your men wages by the last as stated by the last witness?—Yes.

12,260. Can you say whether, on the whole, the wages have increased in the herring trade or not?—The wages have not increased.

12,261. I do not mean per last, but whether, on the whole, the men make more in the trade than they did formerly?—They make as much money; they have got more fish in the last three years to make up for the decreased price.

The witness withdrew.

J. Mainprize.

JOHN MAINPRIZE called and examined.

12,262. (*Mr. Caird.*) Are you a purchaser of fish here?—Occasionally I purchase fish, but I am the owner of vessels employed in the herring and mackerel fishery. I have one vessel engaged in trawling.

12,263. Then you are acquainted with all the kinds of fishing practised on this coast?—I am, but more particularly with the herring and mackerel-fishing.

12,264. Can you give us any accurate figures as to the quantity of herrings caught here in the season?—I have no means of giving an accurate opinion. I can only estimate it by the larger proportion which has been taken up by the owners and cured.

12,265. Have you ever made any computation of the whole quantity caught here?—We have something like 400 vessels fishing out from Yarmouth, and I should consider 50 lasts per vessel an average catch.

12,266. Those are 20,000 lasts altogether?—Yes; I am speaking now of the autumn fishing.

12,267. That is the great fishing?—Yes.

12,268. How many fish are there in a last?—10,000. There are 33 warps to the 100, and four to the warp.

12,269. You call a last 10,000 in number, but a last of fish is in reality very much more than 10,000?—Yes, there are more than 13,000 in a last.

12,270. That comes to 250 millions of fish in a season?—I have never calculated the quantity, but I know that it has increased during the last two or three years. The number of boats has also increased.

12,271. The quantity caught now is a considerable increase on what was caught previously?—Yes.

12,272. You mean that 20,000 lasts are an average season's catch now?—Yes, and that is more than used to be caught because there are now more boats.

12,273. The quantity you mentioned as the present average catch is beyond an average catch?—No, I should take it as an average catch.

12,274. Then the herring must be a source of large revenue to Yarmouth?—It is the chief source of employment we have here; it is our staple trade. In addition to that we have trawling vessels employing six or seven hands each all the year round.

12,275. Do you know the number of people employed altogether in the fishing business in Yarmouth?—I have no means of knowing, except by calculating the number of vessels.

12,276. May we take 10 as the average number in each herring vessel?—That is rather too much, I should say nine would be the full average. There are a great many small vessels. Taking the average of the year the number of trawling vessels would be about 100.

12,277. How many men are employed in the trawlers?—From six to seven.

12,278. Then there are upwards of 4,000 fishermen employed here?—Yes, at sea.

12,279. Sea fishermen?—Yes.

12,280. Do you agree with the previous witness, that the quantity of fish caught, on the whole, is increasing here?—Yes, as far as my experience goes.

12,281. Does that refer to all kinds of fish off here?—Yes, with the exception of mackerel and also the midsummer herring.

12,282. Do you only fish for mackerel in the summer time here?—From the early part of May till about the 20th of July.

12,283. Do you not find them in the autumn?—There have been a few caught by the herring boats, but they do not fish for them expressly.

12,284. They do not come in sufficient abundance to pay?—No.

12,285. Are they seasonable?—They are good in quality this year, but as a rule they are not considered seasonable.

12,286. As a rule have you observed that since they have fallen off in the summer they have increased in the autumn?—Not generally.

12,287. There has been a decided falling off in the midsummer-fishing here?—Yes, from 1853 to 1857

there were abundant years; since then the catch has been very indifferent.

12,288. Has it fallen off in large proportions?—Yes, very large.

12,289. Has the number of boats decreased?—No, it is about the same.

12,290. Then they make a worse business of it?—It has not been at all remunerative.

12,291. Is there any cause to which you attribute that?—By practical people it is attributed to the spring-fishing. A great number of small fish is supposed to be destroyed—the catch is very small; a great number of small mackerel are also destroyed. They are a very tender fish, and as soon as they strike the net they die; large quantities are supposed to be destroyed in that way.

12,292. This spring-fishing has not existed long?—No.

12,293. Only about 10 years I believe?—About 10 years.

12,294. Was the midsummer-fishing successful before then?—It varied, but it has been very unsuccessful for several years since 1857.

12,295. Do you attribute that to the existence of this spring herring-fishing?—Not entirely.

12,296. Are you acquainted with any other ca[illegible]use?—No.

12,297. You know of no other cause w[illegible] injured the fishing or controlled it?—No[illegible]hich has have always been great fluctuations[illegible]; but there

12,298. From your own experienc[illegible] further than 10 years?—I have [illegible]e can you go back business for 16 years. [illegible]been engaged in the

12,299. Was the midsum[illegible]mer-fishing better 16 years ago?—Much better tha[illegible] it has been during the last two or three years.

12,300. And then [illegible]ou had no spring herring-fishing?—No.

12,301. Then d[illegible] would be benefici[illegible]o you go as far as to say that it spring herring-f[illegible]al to the catch of fish generally if the think so. [illegible]shing were put a stop to?—I certainly

12,302. If [illegible] mesh should [illegible] it were made imperative that a small think that [illegible] not be used, would that be sufficient?—I

12,303. [illegible]would effectually check it.

sea?—I [illegible] It would not be worth their while to go to the ordi[illegible]do not think they would catch these fish with

12,30[illegible]ary sheal.

Yes. [illegible]4. Then it would be given up altogether?—

12,30[illegible]

Yes. [illegible]05. And you think it desirable to do that?—

12,[illegible]

Gove[illegible]06. If such a regulation were imposed by the fish?[illegible]nment it would tend to increase the supply of also [illegible]—Yes; the supply of midsummer herring and [illegible] of mackerel.

able[illegible]2,307. Do you know whether any large or valu-fishi[illegible] quantity of herring is obtained in the spring-the [illegible]ng?—The quantity is very large sometimes, but are [illegible] fish themselves are comparatively worthless. They ma[illegible] not worth more than the price they can bring for [illegible]nure.

not [illegible]2,308. Are those which are sent to the large towns firs[illegible] worth more than the price of manure?—At the ve[illegible]t part of the season they are; it is a season when sal[illegible]y few fresh herrings can be obtained, and for the bu[illegible]e of novelty persons purchase them once or twice, th[illegible]t those who deal in them generally send orders to m[illegible] salesmen, after a very little time, not to send any [illegible]re; they are not liked generally.

to [illegible]2,309. After they have been sent for a certain time tak[illegible] the manufacturing towns, do the markets refuse to [illegible]e any more of them?—As a rule they do.

[illegible]2,310. Is there then a glut here?—Yes.

—Y[illegible]2,311. And they become comparatively worthless?—[illegible]es.

12,[illegible]312. And are sold as manure?—Yes.

price?—[illegible]13. And even as manure they bring an inferior

12,31[illegible]—Yes; from 2*d.* to 3*d.* a hundred.

am not [illegible]4. Is any large quantity sold as manure?—I [illegible]able to state the quantity because the spring herring-fishing is prosecuted more by the Lowestoft boats than by ours. It is carried on by the half-and-half shore boats at Gorleston. It would not answer to prosecute this fishing at all unless it was done by the shore boats.

12,315. Are many of the spring fish caught by the large decked boats?—Not by the larger class of vessels, but the same boats are also employed in the autumn-fishing.

12,316. (*Professor Huxley.*) Have you noticed any considerable variation in the catch of herring during the time you have been here?—It does vary very m[illegible] from one season to another. [illegible]uch

12,317. Is there often a run of bad [illegible] has been a large increase in the [illegible] years?—There within the last two years. Fi[illegible] catch on this coast two or three years we ma[illegible]ve or six years since for Yorkshire coast. Co[illegible]de our voyage chiefly on the then, but during t[illegible] comparatively few were caught here voyages alm[illegible] the last few years we have made our caught [illegible]ost exclusively on this coast, and have [illegible] much less on the Yorkshire coast.

[illegible]2,318. Is there any cause you can assign for that?—No.

12,319. Do you pay much attention to the northern markets in reference to the catch in the north?—We generally seek for information as to how the catch goes on.

12,320. It is of interest to you to know the state of the market elsewhere?—Yes.

12,321. Have you noticed any alteration in your catches here as compared with the catches at Wick and North Berwick?—No.

12,322. Have you ever observed whether if you have a good catch here they have a bad one there?—I have not noticed that.

12,323. There has been a very good catch at Wick this year I believe?—Judging from the Scotch accounts there has been.

12,324. (*Mr. Lefevre.*) Is the low price of herrings due to the great catch here, or is it due to the increased catch in other parts?—To both causes, and also in some measure to the depressed state of the manufacturing districts.

12,325. (*Mr. Caird.*) Do you cure chiefly for the foreign markets?—Do you mean the bulk of what I ship abroad?

12,326. Yes, as red herrings.—Yes.

12,327. Where do you find the best market for them?—We chiefly send to the Mediterranean ports. There are some markets to which we send a better description of fish than others; for instance, to the lower parts of the Mediterranean. To the Adriatic and other parts we send an inferior quality of fish.

12,328. Do you send the best fish to Spain and lower Italy?—Unfortunately we cannot ship for Spain at all. Their duty is quite prohibitory.

12,329. Their duty is really prohibitory?—It is practically prohibitory.

12,330. Is there no such duty in Italy?—A duty existed in Naples some time ago, but when the late change of government took place it was remitted, and became merely nominal.

12,331. And has the export to Naples increased in consequence of that remission of duty?—Yes.

12,332. Your best markets are now in the south of Italy?—Yes.

12,333. Do you send to Malta?—Yes, we send an inferior description of fish there.

12,334. Do you supply the Greeks?—Yes.

12,335. And you send none at all to Spain?—No, we believe it would be a great advantage if we were able to send to Spain.

12,336. Do you send to Portugal?—No.

12,337. In consequence of there being a prohibitory duty in Portugal?—I believe so. I feel confident that the fish would have found their way there if it had been at all practicable.

12,338. Do you know what is the amount of the duty in Spain?—I am not able to state, but I know that it is quite prohibitory.

GREAT YARMOUTH.

J. Mainprize.

16 Nov. 1863.

12,339. There is no fish sent to Spain in consequence ?—No, none.

12,340. Are your fish exported in barrels ?—Yes.

12,341. Do you know the average number of barrels exported from Yarmouth in a year ?—It is very large indeed, and has been so for some years. During the last two seasons large quantities have been shipped by steam for London. There are no official records kept I believe. Last year the direct shipments were between 50,000 and 60,000 barrels.

12,342. What were the home shipments ?—Perhaps 20,000 last year ; this year they will be more.

12,343. So that there will be upwards of 80,000 barrels sent abroad ?—Yes, speaking of the last two seasons, when the quantity caught has been much in excess of previous years.

12,344. Has the price of the fish sent abroad fallen off in the same proportion as at home ?—Very much so.

12,345. (*Mr. Lefevre.*) You do not gut the fish here at all ?—No.

12,346. Do you know if the French boats off here gut their fish ?—I think they do.

12,347. Do they get a better price for the fish when gutted ?—I am not able to give an opinion on that point. We do not compete with them. The pickled fish is sent chiefly to the Baltic. The Scotch have that market in their own hands almost exclusively.

12,348. You do not send to France ?—No.

12,349. There is a prohibitory duty there ?—It is much lower than in Spain, but we do not find it answer.

12,350. (*Professor Huxley.*) Is it possible to obtain any record here of the quantity of fish cured during the last 10 years and exported ? Is there anything like a trustworthy record to be obtained ?—I hardly know how it can be obtained, but we will be glad to do our best to furnish you with it.

12,351. Can we obtain anything like an approximate estimate ?—Not an accurate one.

12,352. But sufficiently accurate to enable us to form a judgment as to the average take of herring ?—I think we can.

12,353. Can you supply us with such a return by-and-bye ?—I will endeavour to do so.

12,354. (*Mr. Caird.*) Is the size of your barrels of red herring the same as that of the Scotch barrels ?—The Scotch barrels are a little larger.

12,355. Do they contain as large a number of herrings ?—I think not. The salt takes up a portion of the room. Our fish being dried pack up closer together.

12,356. Do your fish bring a greater price ?—Not as a rule.

12,357. Are they about the same price ?—I think the Scotch herrings generally obtain a higher price.

12,358. They are differently cured altogether ?—Yes, their package is more expensive. Being wet they are obliged to be in light packages.

12,359. They do not go to the same expense you do in smoking ?—No.

12,360. That seems to be a costly process ?—Yes. I am not much acquainted with the Scotch herrings.

12,361. Do you put a trade mark on your herrings when they go abroad ?—Only our own mark.

12,362. Is your own mark known generally abroad ?—Yes, and in consequence there are some brands that fetch a higher price than others.

12,363. According to the character of the curer ?—Yes.

12,364. Is that regulated by the number of herrings marked on the barrel showing the size of the herring ?—Yes.

12,365. Is that generally a sufficient test to secure a good price for the herring ?—Yes, if the foreigners can depend on the brand.

12,366. Do they depend on the brand ?—They rely upon it in a great measure.

12,367. They cannot look at every herring in a barrel ?—No ; where a shipper has been in the habit of sending for many years the buyers know if they can depend upon his mark.

12,368. Are different prices given for the herrings cured by different curers ?—Yes ; as much as 50 per cent.

12,369. When there is no difference in the quality? —Generally there is a difference in quality.

12,370. Then there is a good reason for it ?—I think so.

12,371. And that is sufficiently tested without the necessity or expense of a Government brand ?—Yes.

12,372. (*Professor Huxley.*) Do you think it would be of advantage to have a Government brand here ?—No.

12,373. Would it interfere with individual enterprise ?—I think we are better without it.

The witness withdrew.

B. Fenn.

BENJAMIN FENN called and examined.

12,374. (*Mr. Caird.*) What is it you wish to say ?—As a preliminary remark I wish to say that I have been fishing since 1819, and that I have been chairman of the mackerel and herring fishery, partly by myself, and in later years as I became older, in conjunction with my friend Mr. Shuckford who has been examined here to day. From the experience I have had, which extends over a very long period, I think the evidence you have received from Mr. Shuckford and Mr. Mainprize, as to the details of the fisheries at Yarmouth, is so correct that any further evidence you could obtain would be merely a repetition, and that too, probably, not from so accurate a source as you have already had, owing to the practical habits of business of the gentlemen who have been examined.

12,375. Then you think that in the evidence we have taken to day we have exhausted the question here ?—I do think so. I hope you will excuse my having made these remarks to you, but having had a long practical experience in the matter, I am enabled to state that with regard to the details of the question you have pretty nearly exhausted it. If there are any other points which have not entered into your investigation, on which you think it desirable to obtain information, I shall be glad to answer any questions you may put to me.

12,376. Does anything occur to you that we have omitted ?—I have on one or two occasions in the course of the time I have been connected with the fisheries given details for the information of the Government. In 1857 some queries were sent down to be filled up and returned to the collector of Customs which, with the assistance of friends, I was enabled to supply. They were general statistics as to the number of vessels employed, the number of hands, the capital employed, &c.

12,377. Was that return as recently as 1857 ?—Yes, it was furnished to the Board of Trade in 1857.

12,378. Have you a copy of it ?—Here is a rough copy, but between six and seven years having elapsed since the return was made there has been much alteration since. With regard to the addition of the half-and-half system of fishing in smaller boats, and also with regard to the spring fishery, returns were to be given. According to the statement I made then to the Government the spring-fishing boats numbered about 300 sail, and they came partly from Scotland, partly from Hastings and Brighton, and partly from Yarmouth. Since that time the greater portion of the fishery has been monopolised or carried on by Lowestoft and Pakefield, and in a small degree by Yarmouth.

12,379. Do vessels not come from Scotland now ?—No ; the fish were so valueless that they found it did not answer their purpose to fit out boats.

12,380. Then is the spring fishery on the decrease ?—No ; the vessels of a small class that fish in the spring autumn fishery are generally employed in the

GREAT YARMOUTH.

B. Fenn.

16 Nov. 1863.

fishery, and they number about 300 sail of vessels. I think the evidence you have already had on these matters from Mr. Shuckford and Mr. Mainprize is as correct as possible. Those gentlemen have formed an estimate on the matter to the best of their judgment, and I quite concur in what they have stated.

12,381. Have you anything to say in reference to the summer-fishing?—The summer-fishing has sprung up within recent years. In the earlier stages of the fishery, about 1819, the number of fishers out of Yarmouth was very small indeed. The number employed in the mackerel trade did not exceed 50.

12,382. How long does your experience extend?—Practically from 1819.

12,383. Comparing that with the present time, has the quantity of fish taken at Yarmouth materially increased?—Yes, very materially, inasmuch as what used then to be termed an average catch of herrings was 30 lasts. Our boats did not make the season last as long as it does now. They did not go to the Yorkshire coast in the early part of September. The fishing used to commence here at New Michaelmas, about the 29th, and it continued until the beginning of December, during which time they caught about half the quantity of herrings they catch now.

12,384. And they have more boats now?—Double and treble what they had in 1819.

12,385. You are speaking now of the herring boats?—Yes.

12,386. Does your experience enable you to speak in regard to other kinds of white fish?—Yes, with regard to mackerel.

12,387. Has the quantity of mackerel diminished or increased?—It has diminished of late years.

12,388. Of late years?—Yes, in the earlier stages of the mackerel fishery the mackerel were much more abundant. The number of vessels to take them was not so large, but the catches of each vessel were of a larger character than they have appeared to be for several years passed. As Mr. Mainprize told you, the mackerel fishery has been carried on at a considerable loss by all parties engaged in it.

12,389. Do you attribute that to the same cause he does, namely, to the destruction of mackerel in the spring-fishing?—I have no doubt that to a certain extent that has a prejudicial effect. The spring-fishing is quite a modern affair altogether; I may be wrong, but my impression is that the herrings caught in the spring are young herrings. I have seen them brought to the quays, and have taken considerable notice of them, and they always appeared to me to be herrings which had not arrived at maturity.

12,390. Do you attribute the decrease of mackerel to the destruction of mackerel by the spring-fishing?—I know of no other cause, although there may be; but if so, it has not come within the scope of my inquiry.

12,391. (*Professor Huxley.*) Have you noticed whether the spring and summer fisheries have in any way affected the autumn catch?—Taking the experience of the last few years, certainly not, because this year the increase in the catch has been larger than it has been on this coast for many years.

12,392. Was there a considerable spring-fishing this year?—That I am not prepared to say.

12,393. Shall we be able to ascertain that fact at Lowestoft?—Yes, better at Lowestoft but the catches continually vary. In some seasons there have been large catches both of herring and mackerel and at others the catches have been very small. I have never been able to assign any cause for the difference. I have seen it stated in some of the papers that trawling has had some effect but at the time of which I speak there were no trawling vessels, and yet the mackerel and herring fisheries fell off without any reasonable or apparent cause.

12,394–5. How many years ago is that?—20 or 30 years.

12,396. (*Mr. Lefevre.*) That was before the trawlers came off this coast?—Yes.

12,397. Do you think it desirable that the Government should interfere more with the trade than they do now either by establishing a brand or giving greater protection?—I think not, except with regard to the sheal of the net which is a question of great importance. In my opinion it is very injurious that a smaller description of sheal should be allowed for the purpose of catching herrings than that of one inch to the mesh.

12,398. Do you think that the interest of the fishermen is not sufficient to enable them to decide that matter for themselves?—My impression is that if parties were restricted to the use in the catching of herrings of the inch mesh it would be beneficial to all—even to those who now use a smaller mesh.

12,399. Have you any reason to believe that in the autumn-fishing nets of a smaller mesh than the legal size are used?—Yes, and they catch an inferior description of fish. When there are only 600 herrings in a barrel they are of much more value in the foreign market than when there are 700 in a barrel.

12,400. Have you any reason to believe that nets of a smaller size than the legal mesh are really used in the autumn-fishing?—If they are used they are used by small boats, of which, of my own knowledge, I have no information. I think they are chiefly used, and the greatest prejudicial effect is produced in the spring-fishing.

12,401. (*Mr. Caird.*) Do you wish to make any further remarks?—No.

The witness withdrew.

The inquiry was then adjourned until Wednesday, the 18th of November, at Billingsgate.

Billingsgate, London, 18th November 1863.

PRESENT:

J. CAIRD, Esq., M.P. (Chairman). | G. SHAW LEFEVRE, Esq., M.P.

BILLINGSGATE.

W. Marchant.

18 Nov. 1863.

WILLIAM MARCHANT called and examined.

12,402. (*Mr. Caird.*) Have you been long connected with the trade in fish in London, Mr. Marchant?—Yes.

12,402*a*. How many years?—42 years.

12,403. Are you a fish salesman?—Yes.

12,404. Can you give us any statement as to the supply of fish at the present time comparing it with previous years?—Past and present?

12,405. Yes.—In about the year 1822, when I first went to sea, about 41 years ago, there were about from 40 to 50 sail of trawling vessels fishing for the London market. At that time there were scarcely any vessels belonging to Dover, Ramsgate, and Hull. There were a few but very few, scarcely worth naming. Our method then was to go to sea as we go now, but not exactly as we go now. Our fish are caught and put into cutters now. Then we went indifferently to sea and caught our own voyage and brought them up to Billingsgate. At that time the fish were much scarcer than they are now. It would take us from four to five days and nights to catch anything like seven or eight bushels of soles. That we used to consider in those days a good voyage for soles.

12,406. You are speaking exclusively of trawling

BILLINGSGATE.

W. Marchant.

18 Nov. 1863.

now?—Yes; with the same net, the same sort of vessel, with everything exactly the same as we n w have, we could only produce that.

12,407. Perhaps you can trace the gradual progress from that time?—Time went on and it kept at that pitch for many years and after that vessels began to increase at Ramsgate, Dover, and, much later, at Hull. The first vessels I think came round from the westward, and brought up at Dover. At first some of our Barking vessels went down as pilots and introduced them on the coast of Holland.

12,408. (*Mr. Lefevre.*) How long ago is that?—That is about 35 years ago, I should think. The fishing still continued, as far as regards sole-fishing, about the same for a number of years. There never was a large quantity of soles in my early time for many years, nothing like what there is at the present time.

12,409. (*Mr. Caird.*) You stated that you were fishing with the same tackle and the same boats then that you fish with now?—The same boats, the same nets, and the same quantity of hands.

12,410. Then there has been no change in your time in the size of the fishing vessels and the size of the nets?—The boats were not quite so large. We have got some now we call extra large, but the nets and the gear are the same.

12,411. What is the length of them?—32 feet up to 40.

12,412. In former times it was the same?—About 34 feet and we had the same beam heads and the same ground-ropes.

12,413. Has there been any change made in the size of the mesh?—No, no change at all; the mesh is or ought to be about the same now as then.

12,414. Then do I accurately understand you to say that at that time, fishing with the same nets as now, they made a smaller catch than now?—Yes, considerably.

12,415. Can you give us any figures to show us accurately what the difference is?—Since trawling has become so general, I think the trawl has operated the same on the soil of the sea as the plough on the land.

12,416. That is an opinion we have heard frequently expressed, but we should like you to confine yourself to matters of fact?—We can take now about the quantity in two nights that we could take in four or five nights then.

12,417. That is double the supply with the same amount of labour?—Rather more than double.

12,418. You mentioned that there were 40 or 50 vessels from London 40 or 50 years ago, how many are there now?—There are about 1,000 sail I should say.

12,419. A thousand from London?—No, altogether. We have about 200 from London.

12,420. I am speaking of London alone?—Mr. Hewett has lately drawn a large number from London. I cannot say what the number of vessels registered in London is, but I should think there is the best part of 200.

12,421. Are we to understand that 40 to 50 vessels 40 years ago furnished the only supply to the London market?—They did.

12,422. And now taking not only the number of vessels that hail from London, but all others engaged in supplying London, how many are there?—The best part of 1,000 sail. There will be 800 at least. In a rough way I should say between 800 and 900.

12,423. Are we to understand from you that each of these 800 or 900 on an average catches twice as many fish as vessels of the same size did 40 or 50 years ago?—Upon an average treble.

12,424. With regard to particular kinds of fish has there been any change in the proportionate supply to the London market of any particular kind of fish?—Yes, in plaice from the coast of Holland, but they have come from elsewhere. They are not so numerous off the coast of Holland.

12,425. What has been the change with regard to cod?—Cod have nothing to do with trawling whatever; they are caught by the line; they are a line-fish.

12,426. Then take soles?—I believe the produce of soles is 100 fold more than it was. Where there was one bushel of soles brought into London when I was a boy there are hundreds now.

12,427. Are the soles of as good quality as they used to be?—They are better.

12,428. Has the progress been recent or gradual?—It appears to have been gradual. As the vessels increased Providence seems to have ordained that the fish should increase also. There are more fish to catch now than there were when the vessels were fewer in number.

12,429–30. If you heard it stated that the quality and size of the fish had rapidly diminished would you consider from your practical knowledge that that is not a correct statement?—I have heard that stated, but as a practical man I should not think that it is correct.

12,431. You think so as a practical man?—Yes, I believe the fish are of a superior quality now than ever were brought to London.

12,432. Take whiting?—They are a hook-fish. The trawlers have no connexion with them at all.

12,433. Then haddock?—Of late years on the northern ground they have caught a great abundance of haddock in the trawl.

12,434. In the trawl?—Yes.

12,435. Were they not formerly caught by the trawl?—Yes, more so on the Holland coast than now on the northern ground.

12,436. How is it with regard to plaice?—Plaice are a fish continually migrating about. They are never more than two months in any part. We can see them grow in numbers. Where we catch a bushel in a couple of hours, a fortnight later we may catch two bushels.

12,437. Has the supply of plaice kept quite up to the demand?—Quite up to the demand, quite as many as we can find a market for.

12,438. Flounders?—No, they are *nil.*, they are a little river fish.

12,439. They do not come into the London market to any extent?—They come in the small channel boats; they are not a deep-sea fish.

12,440. Well, I suppose that exhausts the trawl fish. Can you tell us about the line-caught fish?—I cannot say much about the line-caught fish. I believe there is as great a supply as there ever was or more, only they come through a different channel than they did formerly when there were no railroads. When I was a boy there was only one steamboat on the Thames, there were no railroads, no ice-houses, or anything of the sort; all the fish for the London market was brought up the river. Now they come from a hundred various channels, from Grimsby by the Great Northern railroad, from other places by the South-Eastern, and from Harwich, Lowestoft, and Yarmouth by the Great Eastern. They are ten-fold now what they used to be when then they came only by water.

12,441. Can you tell us whether the ground on which the greater number of the trawlers fish has varied very much from what it was 40 years ago?—All I can say is that, like Nelson, I have gone through all the degrees. I went first as a cabin boy, then from cabin boy I became master, from master I became admiral, and from admiral I have now become a commander-in-chief. I can therefore speak a little from experience, and the fact is I believe the ground is in a better condition for supplying food to the fish, principally through the trawlers. I believe that if it were not for the trawlers who are continually trawling at the bottom of the sea the ground would become covered with a kind of muck, and there would be nothing for the fish to live on; the trawls constantly passing over it level it.

12,442. You have not answered the question I put to you, which was this—Suppose you were 40 years ago fishing on certain fishing grounds that were well known to you, have the vessels in the course of that time found it advantageous to shift from those grounds?

—Not much. We go on those fishing grounds every season. We have our seasons.

12,443. Do you go further north?—No, we go on just the same ground that we did 40 years ago at certain times of the year, but of late years, since we have had railroads and ice, we have stretched further north, and for why? because the soles on the Holland coast were always very small. From my infancy up to the present time they were always small fish, but the further north and the more we approach the western shores the finer and better the fish are.

12,444. The fish are much finer on our own coast?—Yes, when we come to the eastern shore we come upon nothing but small fish. When I was a boy our market was supplied chiefly by Dutch fishermen. Two-thirds of the turbot that came to the market were brought by the Dutchmen. We used to rig little boats from this place and go to the Dutch coast where we caught small fish, little turbots, by millions. I believe those harbours are the nursery of the brood of flat-fish. I believe they supply the produce of the whole German Ocean.

12,445. Do you mean the bays on the Dutch coast?—The Zuyder Zee and all along that coast.

12,446. Have you fished there up to this time?—Yes.

12,447. Do you believe that at this moment they continue to trawl in those bays?—There are very few bays in Holland. The coast is flat, with large inlets, and thousands of these vessels, the Dutch vessels, fish there as they always did.

12,448. Do they still continue to catch the small immature turbots they formerly caught?—Not so much. They come further out, but they catch small fish. They do not want large fish. Their fish is caught for salting and drying.

12,449. Do you know whether they continue to fish in the mouths of those rivers and the Zuyder Zee?—Yes, the Dutch vessels do.

12,450. And do they continue to catch the small turbots there?—No, they come further out.

12,451. Is there much of the supply to the London market brought from the Dutch coast?—Not so much now as there formerly was.

12,452. Is there not a considerable quantity of fish brought from the Dutch coast and from Dutch vessels?—Not so much as we used to bring in. We used to bring more turbot than is brought now. There is now and then a good supply of cod brought, but very little trawl-fish. Their cod is caught on the Dogger Bank and on our western ground.

12,453. Caught by the Dutchmen?—Caught by the Dutchmen.

12,454. I want to know whether any large proportion of fish supplied to Billingsgate market is brought by foreign fishermen?—Not a large supply. I believe there is some.

12,455. Is there a regular supply from foreign fishermen?—No, not a regular supply. We should go very short if we trusted to them. There is a supply coming now and then from various sources, but of little importance, except cod now and then.

12,456. What is the proportion?—I have not gone into that. It is as nothing; thrown into the scale, it may be called dust in the balance, but it is nothing to operate on our market at all in the trawling way. In the cod way sometimes it does.

12,457. Now regarding the price, has there been much change in the price of fish in the 42 years of your experience?—Yes, a great difference.

12,458. Can you give us some facts regarding that, carrying it on progressively to the present time?—The price then varied very much, and of necessity. If a man had six bushels of soles for his voyage, perhaps the first bushel might fetch him 10*l.* and the rest 15*s.* If you had got fresh fish in those days you could get any price for it. The order of the day then was to get a bit of fresh fish, if possible, and it was such a rarity to get it into the market, that if we could have got fresh fish into the market then as we do now we could have ridden in our carriages in half the time that we have been labouring.

12,459. Then we are to understand that not only the supply of fish has increased, but the supply of fresh fish?—Yes, I believe that where we throw away one hundred weight now, we used to throw away a hundred tons.

12,460. Was that caused by the delay in bringing the fish to the market?—Yes, a great deal of it.

12,461. By the time lost in the fish coming to market?—Yes, the fish used to spoil.

12,462. In what way is that remedied now?—By the use of ice, and the assistance of the railroads; but ice is the main thing.

12,463. The aid of ice has enabled you to go out further to sea?—Yes, by the use of ice we can go further out and bring the fish direct to market.

12,464. Now let us know something as to the progressive rate of the price of fish?—The price is always varying. If you had come to our market last week to purchase soles you would have been frightened. There was such a fluctuation in the price that you could not enter the market. If no more fish came to London now than did then they would be worth a guinea a mouthful. Last week soles were worth 4*l.*, 5*l.*, or 6*l.* a box, and now you may buy the same article as good or better for 12*s.* or 14*s*; that is the difference in a week.

12,465. It depends on the supply?—It depends on the supply, not the demand but the supply.

12,466. Do not take week by week, but year by year?—Year by year, there is not a great deal of difference. There was a difference at times in other years, or else how could a man live catching a bushel of soles and being a week in doing it?

12,467. Instead of going back 40 years, go back to a more recent period, say 20 years ago. What was the average price of soles in the London market 20 years ago?—I do not think there is a great difference.

12,468. Is it less or more now?—I think it is less. Taking the general market from time to time, I think fish is produced now at a cheaper rate than it ever was.

12,469. Do you think the average price of fish in Billingsgate market is lower than it was 10 or 20 years ago?—I believe plaice is more, soles are less. I believe plaice fetch much more money on the average, and soles much less.

12,470. What is the relative price of plaice and soles per pound weight?—I cannot answer that, it is so fluctuating.

12,471. Then may we gather from your answer that the higher priced fish, and the more valuable fish, have become more plentiful and gradually lessened in price?—Yes, a little.

12,472. Is there a larger proportion of soles brought to the London market than of plaice altogether?—Taking the year round, there is a larger quantity of plaice.

12,473. Have you any knowledge of shell-fish?—Not much.

12,474. (*Mr. Lefevre.*) How long were you at sea, Mr. Marchant?—About 25 years.

12,475. And you are now a salesman?—Yes.

12,476. And the owner of trawling boats?—Yes.

12,477. How many?—Five.

12,478. Now, during the 25 years you were at sea, what was the furthest point you went to with your boats?—I should say the Texel, upon the Dutch shore, or down to Schelling for a short period of the year.

12,479. And on our coast how far?—As far down as Cromer, and on the Lincolnshire coast. I am speaking of trawling now; I am not speaking of lining. We go down to the Orkneys lining.

12,480. And you say that trawling boats still go on the same ground now as they did when you were young?—Yes.

12,481. And you think that they catch the same quantity of fish now as they did formerly?—I am

BILLINGSGATE.

W. Marchant.

18 Nov. 1863.

satisfied they catch threefold more than they did at that time.

12,482. Over the same ground?—Yes, three times the quantity.

12,483. Are the wages you pay to the seamen the same now as they used to be?—Just the same, there is no difference whatever.

12,484. Do you buy fish of any fishermen other than trawlers?—No.

12,485. Can you tell us how many line fishermen are going from the port of London?—There are not a great many, perhaps 50 or 60 sail from Greenwich and Barking.

12,486. Fifty or sixty sail now?—Yes.

12,487. Do you buy any fish of them?—No.

12,488. Can you tell us whether there is any difference in the quality of fish brought in by the line fishermen and by the trawlers?—I believe the quality is about the same as it was. The quantity is greater than it ever was, and the quality is the same.

12,489. Is the quantity brought by the line fishermen the same as it used to be?—Much about the same; in fact they bring more than they did, because the facilities are much greater; the produce is double. The time used to be taken up by passages to and fro.

12,490. Whereabouts do the line fishermen from London fish?—They are all on the same ground; the season compels them to be all on one ground or thereabouts.

12,491. Do the trawlers at all interfere with the line fishermen?—I do not believe they do; imagination may lead some people to think so, but I do not think it myself.

12,492. Have you had any means of judging of the difference in the quality of the fish brought in by the line fishermen and the trawlers?—I do not know that there is any difference. If we catch a cod it is a cod, and it seems to be of about the same quality as those caught by the lines, only by catching a greater number they have a better selection.

12,493. Do the fish brought in by the line fishermen fetch a better price than those caught by the trawl?—They bring a different article; they bring round-fish, we bring flat-fish; ours may be brisk and theirs dull sometimes, and at other times theirs may be brisk and ours dull.

12,494. Do they both bring haddocks to the London market?—The line-vessels bring very little; that is an express business of itself. The haddock business is hardly worth mentioning.

12,495. Do the trawlers bring no cod?—They bring a great supply of haddocks but very few cod, scarcely any worth mentioning.

12,496. Is there any difference in the price of those brought by the trawlers and those brought by the line fishermen; I mean as regards cod?—I should say so. It is treble or four or five times as much. If a cod is caught by a trawler in all probability it is brought in dead and is of very little value. The cod brought here by the liners are alive, and, generally speaking, one live one is worth a dozen dead ones.

12,497. Is any considerable portion of the fish brought in by the trawlers damaged?—Not in these days. There is a small supply now and then, in consequence of the ice vessels missing.

12,498. I mean is there any considerable portion of the fish brought to the London market damaged?—No.

12,499. Is any portion considerably mangled?—No, none of any consequence. There is a small portion which may be injured in stowage.

12,500. What I want to know is, whether the fish brought up are damaged in the catch?—Scarcely any. All are brought up marketable in the net; nothing whatever is damaged in the trawl. I never saw a fish injured by being brought up in the net in my life.

12,501. Do you know how many cutters there are belonging to the London market?—About 40.

12,502. How long ago is it that ice was first introduced, and cutters, into the trade?—Cutters 15 or 16 years ago, and ice about 11.

The witness withdrew.

W. Deering.

WILLIAM DEERING called and examined.

12,503. (*Mr. Caird.*) You are clerk to the market at Billingsgate?—Yes.

12,504. How long have you held that office?—Seven years come next month.

12,505. Do you keep a record of the supply of fish to Billingsgate market?—I simply keep a record of the number of vessels and the number of vans that are sent away.

12,506. The number that daily comes to Billingsgate market?—Yes.

12,507. Do you keep any record of the quantities of fish and vessels discharged?—No.

12,508. Have you any means of getting at it?—None, except the merchants themselves furnish it.

12,509. Is there any means by which we could ascertain, with accuracy, the supply of fish to the market at Billingsgate, daily or weekly?—I believe it would only be an approximate statement.

12,510. Can you give us an approximate statement?—I could not presume to do that.

12,511. Is there any record from which you could get an approximate statement?—I could only get one by applying to all the salesmen in the market.

12,512. Are there no dues paid on the sale of fish?—There are dues levied on the vessels and paid by the vans.

12,513. Not on the quantity of fish sold?—No, not on the quantity of fish sold. To convince you of the impracticability of getting such a statement I may say that I have known a van come with a solitary package and I have known vans to contain 250 packages. You could only ascertain the number of vans that pay the toll, and that is all. It would not be possible to arrive at a correct estimate of the quantity of fish sold.

12,514. Are the tolls you mentioned certain dues levied upon the fish sold in the market?—Certain dues levied on the conveyances bringing fish; not on the fish themselves.

12,515. Are they levied in the market?—Yes.

12,516. Have they been pretty uniform for a number of years back?—I can only speak for seven years.

12,517. Has the rate been uniform for those seven years?—I think there has been no decrease in the number of vessels.

12,518. That is not the question. Have the dues been the same?—I think the dues on the whole have been on the increase.

12,519. Then upon the dues on each individual vessel the rate of payment has been the same during the whole of the seven years?—Yes.

12,520. Can you give us the total amount of dues for each year during those seven years?—I have it in detail from day to day, but I furnish a condensed statement every week to the comptroller's office, and they further condense it into an annual statement.

12,521. You mean the comptroller of Customs?—No, the city comptroller.

12,522. Then, could we obtain from you or the city comptroller the annual amount of dues levied?—Yes.

12,523. Would that, to some degree, be a test of the gradual and progressive supply of fish in Billingsgate market?—It would be a test to a certain extent.

12,524. Do you know of any better test by which we could arrive at a result with accuracy?—None, except a personal application to the salesmen for the exact amount of the fish.

12,525. Is that practicable?—No.

12,526. Can you suggest a better test?—No, I cannot suggest a more correct test.

12,527. Can you yourself give us the facts to which

you have referred, namely, the annual accounts during the time you have held the office?—I could not give it without going through all my books from day to day.

12,528. You say you give a weekly abstract?—Yes.

12,529. Can you not add that up for a year?—When it passes from my hands I have not the weekly abstract. I have the particulars from which the abstract was made out.

12,530. Do you pay the dues over to the comptroller weekly?—Yes, weekly.

12,531. Can you not give us the amount?—Yes, by reference to the cheque book.

12,532. We are desirous of arriving at some accurate statement of the facts?—I am prepared to give every information in my power, but it would be a very difficult affair to give a detailed statement.

12,533. We do not want a detailed statement, but week by week, or year by year—which would be most convenient to yourself?—It would be more convenient for them to render it in a condensed form. They have it done for them all ready. It would be exceedingly difficult for me to go over my books from day to day.

12,534. Then you think we can get the information better from the comptroller?—Yes, I cannot see any hindrance whatever to your obtaining the information.

12,535. Then speaking from your own knowledge during the seven years that you have been clerk, do you think the supply of fish in Billingsgate has increased, diminished, or remained stationary?—I believe the supply of the coarser kind of fish has increased.

12,536. The coarser and lower priced fish?—Decidedly so; especially with regard to haddocks, for which almost a new market has been created by a number of the poorer costermongers taking up the trade of haddock curing. They have been sustained by the fishermen with a larger supply, and as the trade has sprung up it has been met by the fishermen connected with this market.

12,537. Has the price of haddocks in consequence of that increased supply diminished or remained pretty stationary on the average?—I am not as competent to speak of that as a salesman would be, but my impression is that when I came here the haddocks were brought in in much smaller quantities than at present, and they were also of less value. A trade has been created for them. A demand has been created. Sometimes these haddocks fetch a very good price and at other times a very low price.

12,538. What other kind of fish besides haddocks has in your opinion increased in supply?—I think the supply of plaice has also increased.

12,539. Any other kind of fish?—I cannot speak positively of any other; my mind is generally taken up with other matters.

12,540. Do these kinds of fish, the haddocks and plaice, which you call the coarser kinds of fish, go chiefly into consumption among the lower classes?—Yes.

12,541. Do you think that in seven years there has been an increased supply of that fish consumed by the lower classes of the population?—Decidedly.

12,542. Are they chiefly trawl-caught fish?—Yes.

12,543. Altogether so?—Yes, altogether so; the haddocks which are cured are trawled fish, and not hooked fish.

12,544. Then with regard to the finer class of fish, what has been the progress in the supply?—I do not perceive any difference, in the supply of soles for example.

12,545. A previous witness stated to us that the supply of soles had increased in his opinion?—He might be perfectly correct, but I am not conversant with the fact.

12,546. You have not observed a decrease?—No, I have not observed a decrease. I should think on the whole, as far as my memory goes, not having made it a matter of particular observation, that there are more soles at present than there were.

12,547. What is the relative price as compared with what it was seven years ago, wholesale?—I cannot tell you.

12,548. You talk of the finer kinds and the coarser kinds, will you name the kinds of fish you classify in that manner?—Turbot, brill, red mullet, and lineswhiting we call fine fish.

12,549. Cod?—Yes, cod.

12,550. Soles?—Yes, we call them fine fish also, and doreys.

12,550*a*. Then in the coarser kinds you include haddocks and plaice?—Yes.

12,551. Anything else?—Gurnet, skate, maids, and that sort of fish, are mostly considered coarse fish.

12,552. Is there any trade name for the finer and coarser sorts?—No.

12,553. We have heard the expression "offal fish"?—That is the coarse kind.

12,554. Are haddock, plaice, and skate included among offal fish?—Yes, the haddocks were once the perquisites of the apprentices belonging to the fishing boats. Now what they once gave to their apprentices has become a matter of material consideration to the fishermen.

12,555. Can you tell us in what proportion the market is supplied with this coarser and finer fish relatively?—No, I cannot do that.

12,556. Taking the whole of the coarser and the whole of the finer, which is supplied in the greatest proportion to the London market?—The coarser fish decidedly.

12,557. Is it the same with regard to weight?—There is a very much greater amount of the coarser kind of fish than of the finer. There are some other fish which have not been named but which must be included among the coarser kind of fish, such as ling, halibut, and several other kinds of fish.

12,558. Can you say from your knowledge of the market whether the price of the finer kinds of fish is greater or less than it was seven years ago?—I believe it is somewhere about what it was.

12,558*a*. Has the price of the finer kinds of fish continued pretty stationary up to this time?—I think it has on the average, but the salesmen can answer that question much better. My business is only to collect the tolls; I do not pay any particular attention to the price the fish are sold for.

12,559. You do not feel yourself competent to speak of the price of fish. During the same period can you say whether it has increased, diminished, or remained stationary?—I would rather decline answering that because there are other persons who can give you their experience upon the matter.

12,560. Can you tell us what proportion of the whole supply is supplied by foreign fishermen?—No, but as far as my knowledge of the matter goes, I should say the quantity coming from foreigners is very small, with the exception of salmon, and I believe your inquiry does not include that fish.

12,561. No?—The principal supply of foreign fish is salmon—Dutch salmon.

12,562. Is there a large supply of smelts from foreign fishermen?—Yes.

12,563. From the coast of Holland?—They do come from Holland.

12,564. Can you tell us the principal source of supply from our own coast independent of the vessels that come direct to Barking in the Thames?—No.

12,565. Is there any means of getting at that information?—None, except from such gentlemen as are here.

12,566. No market returns show it?—No.

12,567. Can you tell us the export of fish inland from the London market?—It is far less from London to the provincial towns than it was, unspeakably less than it was before the establishment of railways. Prior to the construction of railways London was the principal emporium for fish, and it was sent from London to all the cities and provincial towns of the

BILLINGSGATE.

W. Deering.

18 Nov. 1863.

Kingdom. Consequently, going back 20 years, there was, with regard to some fish, a very large quantity sent away; for example, a large quantity of cod was sent away at that time because all the cod being brought here to be sent into the country the quantity was larger then than it is now when so much is sent coastwise from Hull, Grimsby, and other places inland.

12,568. Do you agree with the previous witness in believing that there is a much larger supply of fish brought into the London market now than formerly?—How many years back do you go?

12,569. We went back in the evidence of the last witness for 40 years, but you say you can only go back seven?—From my observation I should say there is a much larger supply of fish. There have been instances in which this market has been for three or four weeks without a supply of any fish.

12,570. Are we to understand that whilst there is an increased supply into the London market there is a decreased export out of it to the large provincial towns of the kingdom?—Decidedly.

12,571. Then there must be a larger supply to the population of London itself?—Yes, a larger supply to the population of London, and a larger supply generally to the population of the country.

12,572. To what part of the country is the fish chiefly sent from the London market; does it go to Birmingham, Manchester, or that direction, or is it sent to the south coast?—I think fish is sent from this market to all parts, but much less to some parts than it was formerly.

12,573. Taking the great towns, such as Manchester and Birmingham, are there any buyers in Billingsgate market, specially for Manchester and Birmingham?—No, but there are buyers for those markets at Grimsby and Hull.

12,574. But not here?—Not that I am aware of, but many of the large fishmongers who are called "Bomarees" in this market send fish in that direction though in smaller quantities than formerly.

12,575. Do you find that the fish comes in a better condition to the market than it used to do?—I do not see any difference; they had ice then, and they have ice now.

12,576. It just remains the same?—Yes, sometimes it came bad then and sometimes it comes bad now.

12,577. Is there any difference in the quality of the fish from the different fisheries?—No, I do not think there is, but that is too finely discriminating a question for me to answer.

12,578. (*Mr. Lefevre.*) Were you connected with the trade before you became clerk to the market?—No.

12,579. Then you cannot speak of any comparative quantity except during the last seven years?—No.

12,580. I think you say the dues are levied on the vans and vessels?—Yes.

12,581. Does every vessel pay the same amount of dues or is it levied upon the tonnage?—If it is a full cargo the vessel pays five shillings, if not it only pays two shillings and sixpence.

12,582. And how is it in the case of the vans?—A vanload drawn by three horses pays one and sixpence, a two horse vanload pays one shilling. The tolls are regulated by Act of Parliament.

12,583. Does the greatest amount of fish that comes to London by railroad come in vans?—Yes, I think it is on the increase.

12,584. Is there any considerable portion of it sold to the fishmongers without coming to Billingsgate from the railroad?—I do not think there is any fishmonger supplied direct from the railway. I never heard of it.

12,585. The fact is that all the fish come to Billingsgate at once?—Yes.

12,586. Do you recollect the time when the fish came in the fishing boats before the time of the cutters?—No.

12,587. Does all the fish come now in the cutters, or are there a certain number of fishing boats that come?—The sprats are brought in the boats in which they are caught, and herring and mackerel have been brought in very large quantities, at the time the dock was in existence, in the boats in which they were caught. Mackerel have long ceased to come in boats, and there has been only one boat of herrings here this year, whereas at one time we were accustomed to have as many as eight a day.

12,588. Then we may take it, with small exceptions, that all the fish comes direct to the port of London in cutters?—Nearly all, very little comes otherwise.

12,589. Is there any inspector in the market to look at the fish, and see if it is fit for sale?—There are two inspectors appointed under an ancient charter by the Fishmongers' Company. I am empowered also under an Act of Parliament to inspect the fish if they are not present. When they are not there an appeal is made to me in any doubtful case.

12,590. Have you power to order the destruction of any fish unfit for sale?—I have power, and use it sometimes.

12,591. Is there any considerable quantity of the fish so destroyed?—A very large quantity in the course of the year.

12,592. Is there any means of getting at the quantity of fish so destroyed?—Formerly an account was kept by my predecessor of all the fish condemned by the inspectors appointed under the charter to which I have referred, but on my appointment the men demurred to that being done, because they thought that it was assuming the credit of having myself condemned so much, whereas they had nothing to show that they had condemned any. I said I wished to have no borrowed plumes, and that if there were any credit in the matter they were welcome to it.

12,593. Can you give us the quantity you yourself have ordered to be condemned?—I can submit my books to you.

12,594. Can you make an extract from them to show what has been destroyed every year since you have been clerk to the market?—There has been a very small quantity independent of that condemned by the inspectors. It was only in their absence that I have exercised any power.

12,595. Do the inspectors appointed by the Fishmongers' Company keep an account?—I think so.

12,596. Do you know whether the fish is ever destroyed in this market in order to keep up the price?—I never heard of such a case.

The witness withdrew.

J. T. Morgan.

JAMES THOMAS MORGAN called and examined.

12,597. (*Mr. Caird.*) Have you been long engaged as a fish salesman in this market?—Ever since I can recollect.

12,598. As a salesman?—I have been a salesman for 24 years.

12,599. Do you sell all kinds of fish that come to the London market?—Yes.

12,600. Then you have had considerable knowledge and experience in reference to the supply of different kinds of fish in the market?—Yes.

12,601. Including both trawled fish and hooked fish?—Yes.

12,602. Can you tell us whether, in your experience, the supply of hooked fish has kept pace with the increased supply of trawl fish?—Yes, there is three times the quantity.

12,603. Three times the quantity of hooked fish?—Yes.

12,604. What do you suppose is the increase in trawled fish?—I should think it is nearly the same.

12,605. Then you think each has gone on progressively at the same rate of increase ?—Yes.

12,606. Has there been any recent falling off in the supply of hooked fish ?—No. I went to sea when I was a boy. I used to be gone about five or six weeks, and I used to come up to Greenwich with a basket of fish containing 10 or 12 and sometimes not more than 6 score of fish, and now I see vessels come in with 10, 20, and 30 score.

12,607. (*Mr. Lefevre.*) Are you speaking of live fish ?—Yes, brought in by vessels that had been engaged in codding.

12,608. When you talk of hooked fish, do you refer mainly to cod ?—Yes, cod and skate.

12,609. (*Mr. Caird.*) In your experience there has been no decrease in the supply of hooked codfish ?—No, there is now three times the quantity. I can prove that vessels I have been connected with during the last five or six years have brought in five or six times the quantity that similar vessels used to catch when I was at sea as a boy.

12,610. Were you a long-line fisherman ?—Long-line and hand-line too.

12,611. Which has increased most in the catch, hand-lining or long-lining ?—The catch by the long-line men has increased the most.

12,612. Are the line-boats the same size as the trawl-boats ?—About the same.

12,613. Do they go on the same ground ?—The line-vessels go on the Dogger Bank during the season.

12,614. What kind of fish are caught by the long-line boats ?—Cod, haddock, skate, halibut and ling; that is about all.

12,615. (*Mr. Lefevre.*) Are you the owner of a fishing boat ?—I have 35 sail.

12,616. What proportion of these are line-fishing boats ?—I have nine vessels hooking and the others are trawling.

12,617. (*Mr. Caird.*) Has the quality of fish you find coming to the market increased as well as the quantity ?—Yes, it is three times as good.

12,618. There is no falling off in the size of the fish that come to the market ?—None.

12,619. Is the cod as good as it used to be ?—It is much better. Twenty-two years ago we used to have cod in the wells for five or six weeks. The consequence was that they pined away. Now they are not caught three days before they are on the consumers table.

12,620. Then the quality is better than it used to be ?—Yes.

12,621. Is there any waste in consequence of the fish being unfit for food, or is that waste less than it used to be ?—Yes, a great deal less.

12,622. Is there less fish caught unsuitable for food than was the case formerly ?—There used to be ten times more thrown away when I was a boy than is thrown overboard now. When I used to go to sea. the first few nights it was our custom to overhaul the well, and throw away all the fish that were dead. Now, the fish are caught, packed, iced, and in the market in three or six days almost alive.

12,623. Is the supply much more continuous than it used to be ?—There is three times the quantity.

12,624. But without regard to the quantity, is the supply more regular day after day ?—Yes.

12,625. Is there a great difference in that respect ?—Three times the quantity comes to the market that used to come.

12,626. And it comes with greater regularity ?—Yes.

12,627. Are there periods in which the market is inadequately supplied ?—Yes.

12,628. Are these periods as frequent as formerly ?—No.

12,629. Do you know whether there is any difference between the quality of the fish caught by the hook by the trawl ?—Yes, the fish they term "offal" caught by the trawl is plaice, haddock, and whiting. They call them "offal" because the fish are dormant when they come to the vessel's side. They are gutted, packed, and sent to London. When they are caught by the hooker they are placed in the well of the vessel alive, and are taken alive to the market.

12,630. Then is the quality of the hooked fish superior to that of the fish caught by the trawl ?—No; one quality is as good as the other.

12,631. You are speaking of the same kinds of fish caught by the line and by the trawl ?—No; plaice are caught by the trawl.

12,632. Perhaps you will be good enough to confine yourself to the same kinds of fish caught by the hook and by the trawl ?—The fish caught by the hook are haddock, cod, and ling principally.

12,633. Are there a good many haddock caught ?—Yes.

12,634. Is the quality inferior ?—The quality of the fish is not as good as when it comes to the market alive, because the fish are gutted as soon as they come on the vessel's deck. They are washed clean, packed, and it takes three days before they get to the market, whilst the fish out of the wells is alive and in the market in 12 hours.

12,635–6. Are all the gutted haddock trawl-caught fish ?—Yes.

12,637. In what proportion is the London market supplied with haddocks caught by the trawl and caught by the hook ?—I should say 99 to 1. Where there is one haddock that comes to the market from the hook there are more than 99 brought by the trawlers.

12,638. Supposing that it might be considered a proper thing to put an end to trawl-fishing altogether, what would be the consequence with regard to the supply of fish in the London market ?—There would scarcely be any at all. There would be no flat-fish whatever. I have had 26 years' experience now, and never more than one turbot came to me that had been caught by the hook, and that was last winter.

12,639. Then there would be an end of turbot altogether ?—Yes.

12,640. How would it be with regard to soles ?—There would be none whatever. They could not catch any with the hook.

12,641. What other fish would the London market also be deprived of if trawling were put an end to ?—There would be no turbot, brill, plaice, and various other kinds of fish that might be mentioned.

12,642. What proportion of the whole supply that comes to the London market would you be deprived of by putting an end to trawling ?—I myself have brought 100 tons per week on the average. For the last four or five years I have averaged 350 baskets a day, which will be about 100 tons a week, and Mr. Hewett has about 200 tons.

12,643. Are you speaking of trawled fish ?—Yes. If it were not for the trawlers I should have none at all.

12,644. What supply would you have had without them ?—I should only have had codfish.

12,645. What weight of codfish ?—From 10 to 12 tons.

12,646. Is that a return in your hand of the quantity you have sold ?—It is just a slight sketch. I find I have had 350 baskets, 1 cwt. in each basket, every day for the last few years.

12,647. Can you tell us the proportion of the principal fish which you yourself sell ?—No. I should think it is about half and half.

12,648. Half what ?—Half offal and half prime.

12,649. They are about equal in quantity ?—Yes, taking the summer and winter together.

12,650. You sell about an equal quantity of prime fish and an equal quantity of coarse fish ?—Yes, that is about the proportion of my sale.

12,651. Do you suppose that your experience represents the average experience of the salesmen in the London market ?—No, I speak of my own sale; what my cutters bring to London.

12,652. Then we must not take that as an accurate average of the supply to the London market ?—No.

12,653. Where do your vessels fish ?—In the summer generally for some months off the back of the Leman and about Smith's Knoll.

BILLINGSGATE.

J. T. Morgan.

18 Nov. 1863.

12,654. How far is that from the land?—About 32 or 35 miles.

12,655. Do you get a great quantity of fish there?—Yes, the fish there are very fine indeed.

12,656. Then do you think that your average will show a larger proportion of fine fish than would be the common average of the London supply?—Yes.

12,657. Taking it at half and half, your average would show a larger supply of the prime fish than comes to the London market on the average?—Yes.

12,658. In your experience, can you give us the relative and progressive price of the different kinds of fish during the last 20 years?—I think that the fish are a great deal cheaper now than they were when I first came into the business.

12,659. Take 20 years ago; do you sell soles by the basket?—No, by the box. We used to sell them by the basket. When I went to sea, 20 years back, I have known the best basket fetch 5*l.* or 6*l.*, the next would fetch 3*l.*, and the last one 15*s.* That is because we were obliged to get our own fish, and were obliged to stop out in muggy weather. We could not get our fish to market with the same facility that we do now. Then it was not unusual to throw on an average one half the produce of the voyage away before we came home.

12,660. On the average, you were formerly obliged to throw away as waste a large proportion of the catch?—Yes, quite one-half.

12,661. What proportion do you throw away now?—We don't throw away a fish's eye now.

12,662. Are none thrown away at all?—No. Some of our baskets may only fetch 8*s.*, whilst others will fetch 3*l.* or 4*l.* We have food for the poor and food for the rich.

12,663–4. Take 10 years ago; you can more easily recollect that time. What were the relative prices of fish 10 years ago compared with what they are now on the average?—Codfish is much cheaper now than it was 10 years back.

12,665. Is it the same with regard to turbot?—Yes.

12,666. And soles?—Yes, almost every kind of fish.

12,667. Do you sell herrings here?—No.

12,668. Are any herrings brought to Billingsgate market?—Yes, there have been more herrings brought here this year than was ever known in the memory of man.

12,669. You cannot speak of the supply or the price from your own knowledge?—No, only through our agent at Lowestoft, who says they have been sold as low as 4*l.* 10*s.* the last, and that I never knew of before.

12,670. Do you know the London market?—No, not for herrings.

12,671. But you know that a large supply comes here?—Yes, very large indeed.

12,672. Do you sell any foreign fish?—Yes, lobsters, salmon, and mackerel.

12,673. Has the supply of lobsters increased or diminished of recent years?—It has diminished.

12,674. Is that chiefly the foreign supply or the supply from our own coast?—We have a foreign supply of mackerel in the season commencing the latter end of June, and running through July and August.

12,675. But I want to know about lobsters?—They are falling off.

12,676. Is there a considerable falling off?—Yes; in the course of the season they have fallen off 5,000 or 6,000 a day.

12,677. Do all the lobsters that come to the London market go to Billingsgate?—They go to Grimsby and Harwich, and they are sent to London every day.

12,678. They are brought up by railway to London?—Yes.

12,679. Is the supply gradually on the decrease?—Yes.

12,680. Is the price increasing?—I don't think it is as good as it used to be, and I think the fish run much smaller than they did formerly.

12,681. The fish are smaller now?—Yes.

12,682. To what do you ascribe that?—I have known years back what we call "tens," the largest fish we have, brought to the market. There would be six, seven, or eight tens in 1,000, and now we do not get more than two.

12,683. Do you suppose that the ground has been too closely fished?—Yes.

12,684. How is it with regard to crabs?—I don't know anything about crabs.

12,685. Do you sell oysters?—No.

12,686. Bloaters?—No.

12,687. Do you sell any dried fish?—Sometimes I sell some dried cod when the vessels come from Shetland.

12,688. Do you sell much of that?—Not a great deal. They generally have orders to sell that at Shetland.

12,689. I believe there is a considerable quantity of dried cod in this market?—Yes.

12,690. Do you sell smoked haddocks?—No, but there are people here who do.

12,691. Is there any large supply of tusk in this market?—No, there are very few here.

12,692. Any skate?—There is a great quantity of skate in the months of December, January, and February. They come from the Dogger Bank.

12,693. Has the supply of skate increased or diminished during the last seven years?—It has increased.

12,694. We find on the north-east coast of England that the supply has greatly diminished?—That is because there is nothing for the fish to eat on the Yorkshire coast. Most of them go off to the Dogger Bank in order to get food.

12,695. Are you confident that the supply has greatly increased from the Dogger Bank?—Yes, it has very greatly increased.

12,696. Has the price kept stationary, or has it increased or diminished?—There is no difference in the price, except that the gutted fish may fetch a little less.

12,697. (*Mr. Lefevre.*) Did you begin life as a fisherman?—I commenced when I was about two or three years old.

12,698. How many years were you at sea?—As soon as I could walk I used to go and look after the boat to see that nobody robbed it.

12,699. How many years were you at sea?—Four years.

12,700. As a fisherman?—Yes.

12,701. And then did you come to land?—I lost the sight of my eye when I was 17 or 18 years old, and I found that the sea did not agree with me.

12,702. When did you first own fishing boats?—When I was about 18.

12,703. How many boats did you begin with?—One.

12,704. And have you gone on increasing the number until you own 35?—Yes.

12,705. Of that number I think you stated that you have nine line-fishing boats, the rest being trawlers?—Yes, I think I have 150 odd apprentices, and that is more than any one can say in England.

12,706. How many?—153 I think.

12,707. How many men do you employ?—From 130 to 140.

12,708. Then one half of the crews you send on board are youths or apprentices?—Yes, one half are apprentices, and one half are men.

12,709. Was the first boat you owned a line-fishing boat or a trawler?—A trawler may be a liner in the line season.

12,710. What do you find pays the best?—I am sorry to say that none of them have paid lately. During the last few months I have lost 2,000*l.*

12,711. Taking the average, which pays best, the line-fishing boats or the trawlers?—Since I have em-

ployed clipping vessels with lines for cod on the Dogger they have done the best.

12,712. Do your line-fishing boats go further out than the trawlers?—Yes.

12,713. The line-fishing boats go off the Dogger Bank, and the trawlers remain off the Ness?—From the Ness down to Flamborough Head.

12,714. Do they mostly keep together?—Yes, in the fall, and they send a cutter away for the London market every day with the fish iced.

12,715. Do you own any cutters yourself?—Yes.

12,716. How many?—18 or 20.

12,717. In addition to the 35 fishing vessels?—No, they are included in them. My fishing vessels are nearly all fast vessels, and can act as cutters.

12,718. Do the line-fishing boats keep together off the Dogger Bank?—No, they go by themselves. They take their bait, make a voyage, and then return back.

12,719. Then you have no cutters going out with the line-fishing vessels?—No, only with the trawling boats. When the wind is against them they employ the fastest cutter they have to take the fish in.

12,720. Can you give us any notion as to which pays best, the line-boats or the trawlers?—The line-fishing boats have paid best during the last five years.

12,721. Do you suffer any loss in consequence of the trawlers coming across your lines?—No, they never go near them. As soon as the trawlers see the fishing vessels with lines it is time for them to get out of the way, because the ground that the liners are on will not suit the trawlers, they would lose their tackle.

12,722. Do the trawlers fish on a different bottom?—Yes.

12,723. In deeper water or not?—It is all according to the season. If there is a frosty night or snow they go to deeper water expecting the fish to come to them. In fine weather they fish in shallow water.

12,724. Have the line-boats increased more than the trawlers of late years?—No, the line-boats from London have diminished; they have gone to Grimsby, from which place they make shorter trips, and send the fish up by railway. By going to Grimsby and sending the fish up by the Great Northern railway they can make three voyages where formerly they could make only one.

12,725. Do your boats go to Grimsby?—They are doing so now. We are short of ice, or they would come up to London.

12,726. Have you ever tried to send out steamers to the trawlers from the port of London?—I have sent them out, but they did not answer.

12,727. Do you find that cutters pay better?—If a steam-boat went out and there was any wind she would roll and smash the boats.

12,728. Do you find that any large proportion of the fish caught by the trawlers comes up in the trawl damaged?—No; I have seen a few baskets occasionally damaged, when the wind was blowing heavy, and the vessel was coming up with the wind against her, but nothing to speak of.

12,729. I mean have you ever seen the fish damaged in the catch?—The fish were never as good in the memory of man as they are now.

12,730. Do the fish come up in the trawl with their scales rubbed off?—Yes, sometimes. The vessel will do that in pulling the net over the ground.

12,731. Are they ever in such a state as not to be fit to send to market?—No.

12,732. You send all to market—large and small?—Yes.

12,733. Is any large proportion very small fish?—We have very few small fish. We have small whitings now and then, but very few.

12,734. You have not a large number of small turbot or young fish?—If we get over to the eastward we get small turbot, but we don't want our vessels to go there.

12,735. Do you agree with the last witness that there is not the same quantity of fish exported from London to the provincial towns as there used to be?—I think there is more. When we had to send by boat 20 or 30 years ago we had to pay 20 times the amount in carriage.

12,736. Do you sell mainly to the London fishmongers?—No, I know there are a great number of soles in the summer season sent to Paris. The French fishermen have not brains enough to catch them good enough for the French Emperor to eat, and the fish are spoiled before they get them in.

12,737. Does any supply come to London that is brought by the French trawlers?—No, we beat them out of the field, they cannot get them good enough. They don't like to give 2,000*l.* or 3,000*l.* a year for ice.

12,738. What is the cost of a line-fishing boat and a trawler complete?—To fit out a line-fishing vessel with a good crew and plenty of lines would cost about 1,500 guineas.

12,739. What is the cost of a trawler?—The cost would vary according to the size. The same sized vessel would cost about 1.200 guineas.

12,740. What is the differenee in the crew?—One has eight hands and the other has 13.

12,741. Can you recollect the time when any quantity of fish was distroyed in the market in order to keep up the price?—No, ever since I have been engaged in the fishing business we have not been able to get enough, leaving alone destroying them.

12,742. I only wanted to know if that was so?—No.

12,743. (*Mr. Caird.*) You stated just now that you send a quantity of soles to the Paris market?—I don't send them myself. The buyers buy them of me and send them to the Paris market.

12,744. Has that only recently occurred?—During the last three or four years.

12,745. Has there been a regular trade of this kind going on between London and Paris in the summer time?—Yes.

12,746. Is it carried on only during the summer time?—One man buys regularly every day.

12,747. Does he take any large quantity?—Yes, 30 or 40 baskets in a day.

12,748. Does he take a large proportion of the whole supply?—No, not any large proportion. It varies according to the price. If he thinks they are very dear he will only buy 10 or 15 boxes, but if they are cheap then he will take 30 or 40. The buyers for Paris are ruled altogether by the price.

12,749. Are the Paris buyers coming in large numbers to your market?—There are only two buyers yet.

12,750. Do you happen to know of your own knowedge what quantity altogether is sold in that way, or whether the quantity sent to the Paris market is increasing?—It is increasing.

12,751. Is it confined to soles?—No, it consists of soles, mackerel, salmon, and nearly all kinds of fish.

12,752. Do they take all kinds of fish to the Paris market?—Yes, with the exception of plaice.

12,753. Are they all prime fish?—Yes.

12,754. Then the price in the Paris market is higher than it is in the London market if they can afford the additional cost of transport?—Yes.

12,755. You do not know except from the quantity you yourself sell how much may go in that way from the London market to Paris?—No.

12,756. How many boxes a day do you say you sell?—As many as 40 boxes.

12,757. In one day?—Yes.

12,758. What proportion of your whole sale per day would those 40 boxes be?—About one-third. Out of 120 boxes the Paris buyers would take about 40.

12,759. Do you know whether they take a considerable quantity from the other salesmen?—No.

12,760. Are you aware that they confine their purchases to you?—No, they do not.

12,761. You do not suppose that anything like one-

BILLINGSGATE.

J. T. Morgan.

18 Nov. 1863.

third of the fish sold in Billingsgate market is taken to the Paris market ?—No, certainly not.

12,762. Nothing approaching that ?—No, not one-twentieth part.

12,763. (*Mr. Lefevre.*) You said that you had been losing money lately ?—Yes, I should like to sell you my whole fleet.

12,764. Do you attribute that loss to any diminution in the quantity of fish ?—No, but because there are so many in the business that everything is very dear, and the American war affects us very considerably.

12,765. You have not found any falling off in the take of fish ?—No.

12,766. When did you last add to your fleet of boats ?—Last Sunday.

12,767. You have bought another boat ?—Yes.

12,768. Notwithstanding that you are ready to sell your whole fleet at once ?—Yes; with regard to the addition to my boats it occurred in this way. I had an old one that I got rid of, and got another in its place. The builder had been boreing me for some time, and at length I gave him the old one and got the new one.

12,769. (*Mr. Caird.*) Does the fact that it has not been a paying business to you of late years arise from the low price of the fish itself ?—No; I think the principal cause has been the scarcity of ice. I have been for six months running to the rail, and throwing two-thirds of the fish away because they would not pay.

12,770. Because they were so plentiful and abundant ?—No, because it would not pay to send up the common fish by rail. The expense is 4*s.* a basket, and that would not pay for packing them up.

12,771. Has the cost of transport increased lately ?—It has in some part.

12,772. Where have you landed the fish of which you are speaking ?—At Lowestoft, on the Eastern Counties Railway.

12,773. The cost of ice and the expense of railway carriage are too great for the common fish ?—Yes.

12,774. The consequence of which is, that you have destroyed a large quantity ?—Yes; if I could have come here with them I should have had tons and tons of poor people's fish.

12,775. Do you mean offal fish ?—Yes.

12,776. What amount of fish did you destroy ?—In July and August we threw away every bit of 10 tons a day. You must understand that if the cutters get 30 baskets of prime their orders are to leave the sea for them to London ?—Yes. When they come direct to London every day. If they have as much as 700 baskets of offal that counts as nothing, because they must come away with the prime.

12,777. The cost of ice and the railway fare make it a matter of consideration, whether the fish will fetch enough to pay the expense you would incur in bringing London there is no risk. In that case the hatches are not touched until we want the fish in the market.

12,778. Has the number of trawlers from London been increasing within the last few years ?—Yes, it has increased every year.

12,779. You think there is room for all that are on the trawling ground ?—Yes, plenty of room.

12,780. And for more ?—Yes.

12,781. Where is it that the fish you refer to are thrown away ?—They are thrown away on the ground on which they are caught.

12,782. Is a large proportion of your catch thrown away ?—Only when we have no ice. If we have ice, we pack everything and bring it to London.

12,783. When you are short of ice you bring only the prime fish ?—Yes, and the best of the offal.

12,784. The rest are thrown into the sea ?—Yes.

12,785. Because they will not pay ?—Yes. I paid the Eastern Counties Railway 140*l.* in July, and I found that I got for the fish about 14*l.* There were no buyers to buy that sort of fish.

12,786. Is a large proportion of the whole summer catch destroyed in that way ?—Not when we have had a severe winter and have got plenty of ice. There was no ice last winter. We had a mild winter and could get none.

12,787. May I ask you as a man having a large capital embarked in the trade, what may be the average expenditure in a year for ice. I do not wish to go into your private business, but I think that is an interesting fact to ascertain ?—Between 2,000*l.* and 3,000*l.*

12,788. Does the price of ice by the ton vary very much ?—Yes, according to the severity of the winter.

12,789. Where do you get it ?—Off the canals and ditches.

12,790. You do not take the North American ice ?—Only when we cannot get any other.

12,791. Is it much dearer ?—Yes, it is far too dear for us.

12,792. Do you buy it at so much per ton ?—At so much per cart. In the winter time we have 2,000 or 3,000 people men, women, and children, employed in collecting it for us.

12,793–4. Where ?—At Barking, in Essex.

12,795. Do you store it in ice houses ?—Yes, and as they go from London the vessels stop at the mouth of Barking Creek. They have 10 or 20 tons of ice put into them, and afterwards they proceed to sea.

12,796. If you have a mild winter and a short supply of ice, you feel the result of it in the summer ?—Yes.

14,797. (*Mr. Lefevre.*) What is the difference in the price of ice this summer and in a summer after a hard winter ?—I have bought it at 2*s.* a ton. The difference in the price this summer is about 40*s.* a ton.

12,798. (*Mr. Caird.*) Then it is of great consequence to you in your trade that you should have a hard winter ?—Yes.

12,799. It is a matter of considerable importance both to the public and to those engaged in the fishery business themselves ?—Yes.

12,800. Do you never buy ice other than that which is collected in the neighbourhood of Barking ?—Yes, we get it from Norway.

12,801. Do you import ice from Norway ?—Yes, I have had several cargoes this summer.

12,802. Do you import it every year ?—Not if we can get the ice at Barking.

12,803. If you can fill the ice houses in Barking you have a sufficient supply ?—Yes.

12,804. If you cannot do that, you have to import it from Norway ?—Yes.

12,805. (*Mr. Lefevre.*) What quantity of ice do you put into your boats in the summer time ?—From 8 to 35 tons.

12,806. And what quantity in the winter time ?—Generally from 5 up to 16 tons. We do not give them too much, if there is blowing weather.

The witness withdrew.

R. Hewett.

ROBERT HEWETT called and examined.

12,807. (*Mr. Caird.*) I understand, Mr. Hewett, that you are largely engaged in supplying the London market with fish ?—Yes.

12,808. Have you been so engaged for some time ?—Yes, for 20 years.

12,909. What may be the extent of the interest you have in it and the number of vessels and people yon have employed in the fishing ?—The firm I represent have between 50 and 60 vessels.

12,810. (*Mr. Lefevre.*) You are the son of Mr. Hewett who gave evidence to us at Yarmouth ?—Yes, I belong to the firm of Hewett Brothers.

12,811. (*Mr. Caird.*) You have between 50 and 60 vessels engaged in trawling and lining ?—Yes.

12,812. What number is engaged in each ?—We have only seven lining now.

12,813. Can the same vessel be sent either to trawling or lining ?—Yes.

12,814. Have you, in recent years, diminished the number engaged in lining and increased those engaged in trawling?—Our liners have been put on within the last four or five years. They are the only vessels that catch live haddocks for this market that I know of.

12,815. (*Mr. Lefevre.*) Where do they catch them?—On the Well Bank and at Botany Gut, and in fact all over the North Sea.

12,816. (*Mr. Caird.*) Were they put on specially for that object?—Yes.

12,817. Was there such a deficiency in the supply of that description of fish that you thought it a profitable trade to enter into?—Yes, there was none of that kind of fish caught as a regular thing. There was no regular supply at all of live haddock for this market.

12,818. How are they kept alive?—In the wells.

12,819. The smacks are well-smacks?—Yes.

12,820. Are there no other well-smacks except those?—Yes, we have several other well-vessels, but they are employed in trawling.

12,821. It has not been usual to have well-vessels engaged in trawling?—Of late years there have been a great many well-vessels engaged in trawling, but not nearly so many as dry-bottomed vessels, not in the proportion of one to three.

12,822. Do you find that the quality of the fish caught by the line is superior to that of those caught by the trawlers? Are the haddocks superior?—They are better when they come to the market because they have only been killed for 12 hours. The others have usually been dead for more than 48 hours and sometimes for three days.

12,823, Within how many years have you put on these seven line-vessels?—Within the last five years.

12,324. Do they fish on the same grounds the trawlers frequent?—Yes, they all fish on the same grounds.

12,825. In your opinion have the trawl-vessels not injured the line-fishing?—No, these seven vessels catch now and send to the market more fish than 14 vessels would have done 12 years ago.

12,826. What line-fishing is that?—Hand-lining.

12,827. To what do you ascribe that increase in the catch?—There are more fish, I believe, and they lose so much less time in their journeys. They put their fish out at Yarmouth every night. The old-fashioned way was that they sent their fish up in hatch-boats to the dock.

12,828. In your opinion, the same number of men can catch more with the same care on the same grounds than they could some years ago?—Not twice as much but half as much again.

12,829. Using the same vessels?—Yes, the same vessels, the same bait and everything.

12,830. Do you agree with the previous witnesses that the supply of fish to the London market is on the increase?—Yes.

12,831. All the different kinds of fish that come to London?—I do not know of any kind that has decreased except brills. I don't think there are as many brills in the market as there were 10 years ago.

12,832. Is there any reason for that?—I do not know.

12,833. Brills are caught by the trawlers, are they not?—Yes.

12,834. Do they frequent any particular fishing ground?—No.

12,835. With regard to the price of fish, do you agree that the price on the whole has been stationary?—I think it is about the same, but I have an idea that the very best fish fetch rather more than they used to do.

12,836. Is that on account of its better condition?—No, I think there is a greater demand for better fish than there used to be.

12,837. Are there more people to buy and eat them?—Yes, we call them West End fish.

12,838. It fetches more money?—Yes.

12,839. Is that the prime sort of fish—soles, cod, and turbot?—Yes, especially turbot.

12,840. Where are the best fish caught—the primest fish?—On all the banks from here to the Dogger. On the Brown Bank, the Swarte Bank, the White Bank, the Silver Pits, and the Dogger Bank.

12,841. Is there any peculiar excellence in Dogger Bank caught fish?—They are larger than the coast fish.

12,842. Are the cod from the Dogger Bank better than the fish caught upon any other bank on this coast?—No, not better than any other. The Dogger Bank cod we look upon as rather a small cod.

12,843. Where is the best turbot caught?—I don't think there is any difference.

12,844. The nearer banks are as good as those that are further off?—Yes, just as good. They may be a little smaller on the Dutch coast.

12,845. You do not find that by sending cutters to the Dogger Bank they bring a better quality of fish than from nearer home?—We get larger fish on the Dogger than on the Dutch coast.

12,846. I am not speaking of the Dutch coast, but of the banks on our own coast?—There are no regular banks on our own coast.

12,847. Not till you get as far north as the Dogger?—They fish at the back of the Leman—outside the Leman.

12,848. Do the trawlers frequent all the regular grounds off our coast?—Yes, all away along, on both sides of the deep water.

12,849. Is the quality of the fish they catch on all sides equal?—Yes; nobody can tell the difference. Nobody can say:—"That fish came from the Dogger and that from the coast."

12,850. Can you make a distinction between those caught off this coast and on the Dutch coast?—Yes, they are lighter coloured and smaller on the Dutch coast. Fish caught close on the coast are always smaller—both turbot, brill, and everything.

12,851. Then those caught on our coast are of a better quality than those caught on the Dutch coast?—Yes.

12,852. Are you yourself a fish salesman in the London market?—Yes.

12,853. Can you tell us anything as to the supply of fish to the inland markets compared with what it was as far as your own experience goes?—A very great deal more goes away from the London market than before.

12,854. Then you don't agree with the previous witness?—I agree with him to a certain extent, but I think he misunderstood you. A great deal more has been sent away this year than last year or the year before, but not so much in proportion to the whole supply that comes into London. That is what he meant.

12,855. There is a largely increased supply into the London market, and although a larger quantity now finds its way into the provinces than formerly it is not so large in proportion?—Precisely.

12,856. Do you think that with the increasing population of London there is a correspondingly increasing supply of fish?—Yes, about the same. That is proved by the price.

12,857. (*Mr. Lefevre.*) Are the inland towns not as well supplied as they used to be?—They have more fish but not as much as they used to have in proportion to the quantity that used to come to London.

12,858. (*Mr. Caird.*) Then practically, as a fish owner and fish salesman, do you find that the supply has kept pretty steadily up to the demand?—Pretty steadily up to the demand.

12,859. If the demand were much to increase would the supply be equally increased?—I am sure of it. I am convinced of it.

12,860. Do you find from your own experience, sending away vessels to sea constantly, and employing a considerable number of men to catch fish, that the fishing grounds are increasing or diminishing in their yield?—We find that each separate vessel catches more fish than it did 10 years ago, and 10 years ago it

BILLINGSGATE.

R. Hewett.

18 Nov. 1863.

caught more than 20 years ago. I know that from past experience.

12,861. You do not apprehend, by the increased population of London and the increased consumption of fish, that gradually the fishing grounds will be completely run out by being over-fished?—I am thoroughly convinced that if you send out double the number of vessels there will be no perceptible difference in the catch of each vessel. If you doubled the number suddenly there would be no perceptible difference.

12,862. You are aware that a great question has arisen between trawl-fishing and line-fishing; will you be so good as to tell us what proportion of the whole supply to the London market is got by the trawl fishermen as compared with the line fishermen?—I should think that the line fishermen do not bring 10 per cent. of the fish that come to this market. They do not bring much over 5 per cent. They may bring 7½, but of the whole quantity that comes to this market they certainly do not bring 10 per cent.

12,863. Any regulation that would materially interfere with trawl-fishing would lead to a diminution in the supply, and I suppose to an increase in the price?—Precisely.

12,864. That would be so?—Yes; if trawling were done away with to-morrow you would not have one-tenth part of the fish in the London market that you have now; nor would it come to land at all in England.

12,865. Do you find that practically you can man and keep a trawl-vessel going at a less expense than a line-fishing vessel of the same size?—One costs only 11*l.* a week and the other 16*l.* A regular line-fishing boat with a full number of hands costs 16*l.* a week.

12,866. You are speaking of boats of the same size?—Yes, from 80 up to 100 tons builder's measurement.

18,867. What is the average weight of fish caught by these boats comparatively in a week?—One catches 10 times the weight of the other. The trawler will catch 10 times the quantity caught by the line-boat.

12,868. In the same time?—Yes, give them day for day, or year for year, take the 12 months round, a trawl-vessel will catch 10 times the weight of fish that a line-boat will catch.

12,869. And they catch the kind of fish that is brought in the greatest bulk to the London market and consumed chiefly by the lower classes?—Yes.

12,870. What is the reason that you employ a vessel which costs you about 50 per cent. more per week in wages and otherwise, and yet yields you so much less fish in quantity?—There is so little of that sort of fish brought to the market—only a tenth part as compared with the other fish—that it is a scarce article. It is brought in very small quantities to the market by railway, and it is all sold as West End fish. If the number of the vessels employed in obtaining it were increased the high price it now brings would last no longer.

12,871. Then it only pays because it is a fish that brings an excessive price from the wealthy classes?—Exactly.

12,872. It goes into consumption in the West End?—Yes, and in the small towns in the country.

12,873. Is that applicable to all hook-caught fish?—No, it all depends on how it is got to the market. If it can be got in quantities sufficient to pay the carriage by railway then it is a very paying thing, but it would not answer in a small line boat. An undecked boat cannot catch enough to send by rail and may not get the low carriage for it. They cannot get the higher price.

12,874. Why not? Do not their fish come fresh enough to the market?—They cannot get it to the London market.

12,875. Not in prime order?—Exactly. First of all they cannot keep the fish alive. Our fish are kept alive until 5 o'clock in the evening; they are then killed, packed quickly, got upon the railway, started off at six, and sold here in the morning; so that only 12 hours have generally elapsed since they were swimming about.

12,876. (*Mr. Lefevre.*) It is brought in alive?—Yes, literally swimming alive.

12,877. How often do the boats come here?—When they get a certain amount. When we find that they are likely to be turning up, or if we fancy that they may get disease among them, then we come in quickly before such a thing does take place. We have only three or four boats of that sort engaged at a time. If we sent a large quantity of that sort of fish into the market there would be no demand for it. If we were to bring 100 boxes of live haddocks into the market to-morrow morning we could not sell more than 25 of them; the rest we should have to sell for less money than trawled haddocks would fetch.

12,878. (*Mr. Caird.*) What is the difference between the price of the live haddocks per box or per pound compared with the larger supply of trawl-caught haddocks?—If the supply of hooked haddocks is not more than 20 or 25 boxes, the one fetches a guinea or 1*l.*, and the other from 6*s.* to 8*s.*

12,879. The same weight?—The same number of haddocks; about 40 of them.

12,880. These vessels are employed purely for the supply of the West End and the wealthy consumers?—Yes.

12,881. And well-vessels supply the bulk?—Yes.

12,882. Do your trawl-vessels and line-vessels fish on the same ground?—Precisely; but not all at the same time.

12,883. They do go over the same ground?—Yes.

12,884. Have you ever had any complaint from the line fishermen that they have been interfered with?—Perhaps I may explain that that can rarely occur, although both are fishing on the same bank. Suppose there is a long-line vessel at work, and boats are also engaged in trawling, the trawlers know it is of no use going where the liners are at work, because they would only lose their gear. The liners pick out that part of the bank where there is a lot of stones and rough ground. It is only on such places that the fish will take the hook; it would be of no use for the liners to put down their bait where the trawlers work. All the haddocks we catch in the net are thoroughly well fed haddocks which would not take the hook; all the line-caught haddocks are hungry fish.

12,885. Then are we to understand that the hooked haddocks, although they bring a much higher price and are brought fresh to the market, are in reality inferior fish?—Everybody who understands the subject knows that very well.

12,886. That is really so?—Yes; the one is a fat well fed fish, and the other what we call a hungry fish.

12,887. Do your vessels ever fish within the bays and headlands of the coast?—Taking the year round, the nearest place we fish to the English coast is about 35 or 40 miles off.

12,888. It would do you no harm then, as a deep-sea fisherman, if a regulation were established preventing trawl-fishing within the headlands of the coast?—That would not interfere with the real trawler at all; no regular trawler fishes within seven or eight miles of the coast.

12,889. You would not object to such a regulation being enforced against you?—No, I believe it would do good in case they did such a thing; they might spoil the breed in the shallow waters.

12,890. That has been alleged in the north and stated to us as a fact. We have been told that if an end could be put to it, it would much contribute to prevent the destruction of young fish; do you think that it is so?—I believe there are a large number of small boats that destroy the brood, but the quantity destroyed will hardly make any difference to anybody.

12,891. You would not object to such a regulation being established?—No, it could not possibly bear injuriously upon the trawling trade; if there is any difference, it would do good.

12,892. Have you any knowledge of the herring trade?—No.

12,893. Nor of the oyster or shell-fish trade?—No, but I have of the mackerel trade. I sold more mackerel here last year than anyone else.

12,894. Do you yourself with your own vessels catch mackerel?—We bought foreign mackerel last year. There is one fact which is, perhaps, worth your while to know, about the making of seamen and apprentices; we have 240 apprentices who are continuously growing up to be men, and we reckon that we make from 50 to 60 seamen a year—thorough fellows, who have served at least their six years time to it.

12,895. Do they go into the mercantile service?—Either there, or into the navy, or into our own trade.

12,896. Do you think it is a good nursery for seamen?—There cannot be a doubt of it; we get them principally from the Unions of London. They are principally bound by the magistrates and the guardians of the poor.

12,897. (*Mr. Lefevre.*) Are they regularly indentured?—Yes, they are bound before the metropolitan magistrates; we have 240 of them, and they are every one of them registered at the Customs.

12,898. (*Mr. Caird.*) Do your vessels frequently assist vessels in distress at sea?—Very often; we are seldom or ever without a case of salvage on board.

12,899. (*Mr. Lefevre.*) Does that form a considerable part of your profits in the course of a year?—It does form a part, but not a considerable part.

12,900. What number of men do you employ besides the apprentices?—About the same number; there may be a few more.

12,901. Is not that rather a large proportion of apprentices to the number of men?—We try to keep as many apprentices as men, so that we may keep up a supply of men who have served their time to the trade. Our men object to have what they call sailors; they like men who have served their apprenticeship to it.

12,902. Is there any complaint on the part of the men as to the number of apprentices?—No; on the contrary, they could not get on very well without them.

12,903. Do your boats fish much off the coast of Holland?—Occasionally, at one time of the year.

12,904. Within what distance of the coast do they go?—Close to the beach, into three fathoms of water. It is a perfectly flat shore—all sand when they are fishing off the Hague. They go close in among the buoys when they are catching haddocks, but the fish are very small compared with what we catch on our own banks.

12,905. Do they catch young fish there?—Our nets would not hold them, but there is a quantity of small fish caught in the shallows.

12,906. By the English or by the foreign trawlers?—Not by the trawlers, but by foreign seine nets.

12,907. What is the size of the mesh of your trawl net?—The lower part when pulled out straight is smallest. We have a gauge; we do not go by inches. What we call the head is the largest part, and is twice the size of the other.

12,908. What is the length of your beam?—The shortest will be about 32; the longest is about 42.

12,909. Is there any inspection of your trawls by any Government officer?—No.

12,910. You never heard of such a thing?—No.

12,911. Do you keep statistics with regard to the quantity of fish caught by each boat?—We keep an account of the catch of every boat as it arrives every day.

12,912. Can you tell at the end of every year what each boat has caught?—Within a very little; it is not the exact weight, but what we call a basket.

12,913. Can you furnish us with the comparative quantities caught by the boats within the last 20 years?—Yes.

12,914. We shall be glad if you can give us a comparative list for the last 20 years, or as far back as you can go?—I can give you an average of each boat.

12,915. Have you added to your fleet lately?—Not very much within the last 10 years.

12,916. You have added seven line-boats?—No, they are the same vessels.

12,917. Can you turn trawlers into line-boats?—They are still trawlers if they were wanted. They are the same shaped vessels, and rigged in the same manner.

12,918. Have you added during the last 10 years to the number of your boats?—In the 10 years we have built about eight new vessels.

12,919. Have they been built to supply the place of others?—Principally to supply the place of others, but they have been larger vessels; they have been carriers principally.

12,920. You have not materially added to the number of your fleet within the last 10 years?—No.

12,921. I think you said that you have 50 vessels now?—Yes.

12,922. And of that number seven are engaged in line-fishing at the present moment?—Yes, and the rest are trawling.

12,923. How many are cutters?—Even the cutters trawl when they are there. Out of the whole number there are 22 cutters; but all the cutters trawl occasionally.

12,924. Do your fleet keep mostly together?—Yes, mostly together in a fleet under the command of one man.

12,925. How many fish together?—From 60 up to 120.

12,926. Then other boats fish with you?—Yes; ours form the nucleus of a fleet, under the command of a man in our pay.

12,927. One admiral looks after from 60 to 100 boats?—It will generally run about that.

12,928. How many cutters are necessary to keep them in communication with the markets?—They send away a vessel every day regularly if they are not stopped by calms. In that case they do not catch any large quantity of fish. Ten cutters will do the will work.

12,929. Constantly proceeding to market?—Yes.

12,930. And trawling themselves a little?—They have not much time to trawl if they are frequently running. They may trawl occasionally. Perhaps the captain knows he has to stop two nights and then he make a night's work.

12,931. I think your fleet has gone further north lately?—They have never been so far before.

12,932. Is that because the ground has been occupied by other boats, or because you found that the fish were falling off?—No; we used to fish as far north as the Silver Pits and Botany. That is deep water, and it is comparatively rough ground compared with the Dogger. The Dogger is shallow water, less rope is needed, and it is like a bowling green. We never lose any thing on it.

12,933. Are there no stones on it?—No.

12,934. How much further is the Dogger than where you have been accustomed to fish?—30 or 40 miles further.

12,935. Since your fleet has been off the Dogger Bank have you found it more convenient to send your boats to Yarmouth?—No; we always bring them to London, but we have taken them to Yarmouth this year on account of the want of ice.

12,936. You have sent them to Yarmouth this summer?—We always bring the fish to London.

12,937. Do your line-boats go out in the same fleet as the trawlers?—No; their fish cannot be carried by the cutters. They have to be put alive into the well, and they are killed just before they are packed. When a man starts lining he is utterly independent of any fleet.

12,938. He does not keep with the other liners?—No.

12,939. What is the nature of the line your liners use? They do not use the long-line?—No, a hand-line, a small line with a sprawl wire.

BILLINGSGATE.

R. Hewett.

18 Nov. 1863.

12,940. How many hooks?—Only two hooks on a line.

12,941. How many lines?—One to each person on board, a man and a boy. They will run from 9 hooks up to 12.

12,942. What is the length of line?—According to the depth of water; about 45 fathoms generally.

12,943. What depth do you fish in?—From 16 up to 40 fathoms.

12,944. What distance from the bottom?—We fish on the bottom. We keep the hooks playing about four inches from the bottom.

12,945. What weight of lead do you use?—4 lbs. of sprawl lead.

12,946. Where do you get your bait?—From Lynn and Boston.

12,947. Do you find any difficulty in obtaining it?—Sometimes, if there is rough weather, the boats are detained; then it comes by rail from Boston to Yarmouth, and is put into the vessels there.

12,948. Do you find the cost of bait an appreciable item in your expenses?—It is a very large item. Wages form the largest item, provisions the next, and bait the next; it is larger than sails or ropes or any thing of that kind.

12,949. Or depreciation of the vessel?—Perhaps not. It is about the fourth item.

12,950. Have you heard any complaints as to the difficulty of obtaining bait?—Very often. In fact, sometimes it is the difficulty of obtaining bait that makes us take the trawl on board again.

12,951. Do you sell for others?—Yes, for a great many.

12,952. On commission?—Yes.

12,953. Are fish sent up to London by rail from other parts of England?—Yes, by railw ay,water-carriage, and other means.

12,954. Do you sell for the fishermen on the Northumberland coast?—None of that fish ever comes to London.

12,955. What parts are the furthest from which they come to London?—In any quantity the furthest they come from is Hull.

12,956. And on the south coast?—From Plymouth in any quantity.

12,957. Do you sell for any foreign fishermen?—I have sold for mackerel fishermen this summer.

12,958. Have you sold fish caught by foreign trawlers?—No foreign trawled fish comes into this market.

12,959. Then you have only sold for long-line boats?—We sell for a great many with whom we are connected.

12,960. Are they all from London?—They sail from Grimsby in Lincolnshire. The crews live at Grimsby. The vessels stay there. They come in there and send their fish by rail in the same way that we send our haddocks from Yarmouth by rail.

12,961. Are their boats fitted for keeping the fish alive?—Yes, with wells.

12,962. Do you sell for line fishermen in open boats?—No.

12,963. (*Mr. Caird.*) Are there any grounds, within your knowledge, which have become fished out?—No, I never heard of any.

12,964. Do you get any Brixham fish here?—Occasionally.

12,965. Does any large supply come from Torbay?—Yes, there is a salesman now in the room who sells all that.

12,966. Is there any difference in the quality of the fish from Torbay compared with our own east coast fish?—Generally speaking they are newer, that is all. They are the same in quality if they were the same in age; but generally speaking they are newer.

12,967. They come fresher to the market?—Yes. They make short voyages, and their fish is almost the same as our line fish. Their boats go off, get in quickly, and send off by rail.

22,968. Do their fish fetch a higher price?—Yes; it is got at a greater expense.

12,969. The Torbay fish fetch a higher price?—Yes; but a great many of the Torbay boats send up in the same way as ours. They join our fleet and send up by our cutters.

12,970. Is there no difference except that they come fresher to the market?—No.

12,971. The quality of the fish is the same?—Just the same exactly.

12,972. The one produces much about the same kind of fish as the other?—Yes, just the same.

12,973. You referred to some kind of lead you called sprawl lead?—Yes.

12,974. What is it?—The lead that keeps the gear at the bottom. It takes it down and sinks it.

12,975. What is it like?—Like a plummet. The sprawl wire goes through it and the hook hangs at one end, so that it keeps the bait at the bottom.

12,976. It runs the line out quickly?—Yes.

12,977. I understood you to say that the liners prefer to fish on rough ground?—Yes.

12,978. And the trawlers prefer to fish on smooth ground?—Yes.

12,979. So that each description of boat will if possible, avoid the ground the other wants?—Yes.

12,980. (*Mr. Lefevre.*) I suppose the rough ground is pretty well known?—They find it out by the lead.

12,981. Between the Norfolk and Yorkshire coasts and Holland the rough ground is pretty well known by the fishermen?—Yes.

12,982. (*Mr. Caird.*) I suppose they put down the lead to ascertain what kind of bottom they are going to fish upon?—Yes; they arm the lead, throw it overboard and from the depth of water and the stuff they bring up they know precisely the spot they are on. They know then how far they are from the rough ground. They never fish towards the rough ground.

12,983. (*Mr. Lefevre.*) Do the long-line fishermen fish on the rough or the smooth ground?—They fish on that part of the Dogger Bank which is noted for being rough.

12,984. They look out for a rough rather than for a smooth bottom?—Yes.

12,985. (*Mr. Caird.*) You referred to a supply of mackerel from Norway?—Yes.

12,986. When did it begin to come to the London market?—About 18 months ago.

12,987. Does it come at the same season as the mackerel from our own coast?—Yes.

12,988. Is it sent in large quantities to this market?—Yes, in very large quantities indeed.

12,989. Does it form a large item in the whole supply?—Very large this last summer.

12,990. Is it packed in ice?—Yes.

12,991. Are the fish much the same in quality as our own fish?—They are very bright. The only difference we found was that on the average they were seven days old. They had been frozen in ice the whole time, so that they were very bright when taken out, and were only good for the day's consumption. They were very bright and nice when taken out.

12,992. They were caught by the Norwegian fishermen?—They were caught by the Norwegians, and brought home in our vessels.

12,993. Do you send your cutters there to bring them in?—Yes.

12,994. Is there a large supply brought in that way?—This last year more were brought from there than anywhere else.

12,995. Have you any idea of the number of tons, or cannot you speak off hand as to what it was?—No, I cannot; we brought more than all the rest brought.

12,996. Had it any effect on the price in the London market?—There was very little Ensglih-caught mackerel in the London market last year.

12,997. Then without that there would have been a small supply?—Yes, very small.

12,998. (*Mr. Lefevre.*) Can you give us a list of the items of expenditure on board the line boats and the trawl boats comparatively?—Yes.

12,999. Perhaps you will make up such a list?—I shall be very happy.

BILLINGSGATE.

R. Hewett.

18 Nov. 1863.

13,000. Are any of the trawl-boats sailing from London owned by the fishermen themselves?—Yes, but not a very great number. Do you mean are there a great number where the captain is the owner?

13,001. Yes?—Not a great many.

13,002. Men working their own vessels?—Not a great many.

13,003. Can you say how many?—I think if I said a dozen I should be beyond the mark. I think you may take it that there are not a dozen.

13,004. Do they generally attach themselves to a larger fleet?—Yes, if they are trawling.

13,005. You give your captains a share of the catch, do you not?—Yes.

13,006. How much a week besides?—14*s*.

13,007. Can you say what their share amounts to in the course of a year? How much in addition?—They earn altogether between 25*s*. and 30*s*. a week.

13,008. Is that as much as they used to earn when you can first recollect the trade?—I don't think there is much difference; I think it has always been about the same. If a man gets over 30*s*. a week for the 12 months it is considered a very good year, and so it was 20 years ago, and if he don't get 25*s*. he considers it a very bad one, and it was considered the same then; there is not much difference.

13,009. Then the men do not get any share in the take?—No, the men are all on wages.

13,010. Have you lost many boats by casualties?—Very few, until last winter; we were very unlucky then; we lost three.

13,011. Do you insure your boats?—No, we never insure them.

The witness withdrew.

E. Jex.

Edward Jex called and examined.

13,012. (*Mr. Caird.*) Are you a fish salesman, Mr. Jex?—Yes.

13,013. How long have you been engaged in that business?—About 10 years.

13,014. Do you sell all kinds of fish that come to the London market?—Yes, all kinds.

13,015. Does that include herrings?—Yes, herrings, mackerel, and shell-fish, such as oysters and whelks.

13,016. In your experience of 10 years, have you observed whether the supply to the London market has increased or diminished?—I don't think it has.

13,017. It has not increased or diminished?—I don't think it has.

13,018. It has remained much about the same?—Much about the same on the average, I think. There are not more fish now in the London market than there were 10 years ago. If anything there may be more; I think there are more.

13,019. Are there not more vessels employed in catching the fish now?—I do not think there has been any considerable increase.

13,020. Has there been an increase in the price?—Prices have averaged much the same.

13,021. Then has the supply in your opinion been stationary during the last ten years?—I think it has. There may have been a small increase, but it has not been great.

13,022. With regard to herrings, do you sell them largely?—Yes, very largely.

13,023. What may be the average supply of herrings now compared with what it was when you began business?—I believe there have been more herrings this year than have ever been known for a great number of years, and the herrings have been of an inferior class.

13,024. Is the quality not so good?—No, there have been so many shotten, small, and very inferior.

13,025. Do you get herrings at different seasons of the year for this market?—There are fresh herrings nearly all the year round.

13,026. But at a certain season they are of a better quality and kind than at others?—Decidedly.

13,027. At what season are the herrings the best?—In the Midsummer season; but the herrings ought to be in their prime at the latter end of October and beginning of November. At this time of the year they are chiefly shotten.

13,028. Is that unusual at this season?—Yes, they are a bad class of fish.

13,029. Are they coming in in large quantities?—Yes.

13,030. Is the supply unusually large?—Yes, we have had more than for many years.

13,031. Do you remember any year in which there was such a great abundance?—No, not within my experience.

13,032. Have you any accurate statement to give us as to the quantity supplied to the market here?—No.

13,033. Can you tell us how much comes into the market in a week, or a day, or a season?—No.

13,034. Is the price at the present time lower than it has previously been, or is it about the same?—Taking the whole summer, the prices have been lower than they have been in any one season within my experience.

13,035. Then this year the supply of herrings in the London market, and the prices, have been less than you have ever known before?—Yes, I believe so, and the fish are inferior.

13,036. Amongst what class of people is the largest consumption of herrings?—The poorer classes.

13,037. Then at this moment there is a large supply of fish which is consumed principally by the poor?—Yes.

13,038. Do you deal in sprats?—Yes, I sell a great many in the season.

13,039. Has the sprat season begun yet?—Yes, about a fortnight ago. There have been sprats here for two months from the westward, but only very few.

13,040. When does the sprat season begin?—About the 5th or 6th of November.

13,041. How long does it continue?—Until the end of February or the beginning of March.

13,042. Where do you get the principal supply of sprats from?—A great abundance in the season comes from Southampton.

13,043. Do they come by rail?—Yes, and a great many by water. Sometimes there are 20 or 30 boats in a day, and at other times only five or six.

13,044. Where do they come from?—According to where the fish lie. Sometimes they lie a great way down and sometimes only a short way down the river.

13,045. Do all the boats come from the Thames?—No, it is according to the season. As the season gets later the fish go lower down. Sometimes the boats go down to the Swin for them.

13,046. Are they caught all along the estuary of the river?—Yes, all down the river and in the river itself at times.

13,047. The great supply of sprats that comes here is caught either in the river or at no great distance from the mouth of the river?—Yes.

13,048. Do you get any by boats from distant parts of the coast?—We get them by railway, but not by boat. Sometimes we get them from as far as the Swin by boat.

13,049. By what conveyance, by boat or by rail, do you get the largest supply of sprats for the London market?—By rail.

13,050. And the largest supply you say comes from Southampton?—Formerly we had a large supply from Scotland, but the largest supply latterly has come from Southampton.

13,051. You still get sprats from Scotland?—The Scotch supply has fallen off lately, the expense of the carriage by rail is so great.

BILLINGSGATE.

E. Jex.

18 Nov. 1863.

13,052. Did they come up in as good condition from Scotland as from Southampton ?—They were in very good condition indeed.

13,053. Have you any knowledge of the quantity of sprats consumed in the London market ?—I have not. I think it is impossible to tell.

13,054. What do you imagine is the proportion as compared with the herrings ?—That would be a rum item to get at.

13,055. (*Mr. Lefevre.*) You get very large quantities of sprats ?—Yes, immense.

13,056. (*Mr. Caird.*) Do the sprats bear any proportion in weight to the herrings ?—No, take the season through, but the herring season lasts all the year round.

13,057. During the season is there as large a consumption of sprats as of herrings ?—In the sprat season I daresay there is.

13,058. Among the poorer classes in London do the sprats form a large proportion of what they eat during that season ?—I think so.

13,059. Is it a matter of great importance that they should be supplied with sprats compared with any other fish they may desire to have ?—There are a great many people who are particularly fond of sprats.

13,060. Are they cheaper than other fish ?—At times they are, but if there is a short supply they get unusually dear.

13,061. Are they the cheapest fish you have in the London market ?—In the full of the season I have no doubt they are. They are sold in large quantities and are the cheapest fish here.

13,062. Have you heard it stated that the system pursued in fishing for sprats is destructive to other fish ?—I believe they do catch a great many small fish.

13,063. Do you find many come to you as sprats ?—We did notice that from Scotland ; there were great quantities of young herrings among them.

13,064. (*Mr. Lefevre.*) Can you distinguish the young herring from the sprat ?—Yes, by the head.

13,065. (*Mr. Caird.*) Is it not the case in the river here that many small fish are caught along with the sprats ?—I daresay it is so in all rivers.

13,066. (*Mr. Lefevre.*) Are they sifted before they come here ; I mean are the sprats sifted from the others ?—No.

13,067. (*Mr. Caird.*) Has there been a large supply of eels in the market here ?—This year there has been a large supply.

13,068. Where do they come from ?—From Ireland chiefly, from the rivers and lochs there. We get a great many from the Shannon.

13,069. Are they fresh-water eels that you get ?—Yes.

13,070. Has there been an unusually large supply ?—There has been an unusually large supply this year.

13,071. (*Mr. Lefevre.*) Are they brought here alive ?—Sometimes, if the weather is cold, but if the weather is warm they come dead.

13,072. Are they ever bad ?—No, they are very good indeed. I never heard of their being condemned, and our inspectors are always round the market.

13,073. If they saw any bad fish they would condemn it ?—Yes.

13,074. Do the eels come to London by railroad ?—I believe they come over to Liverpool, and from Liverpool they are sent by rail.

13,075. (*Mr. Caird.*) Do you sell bloaters ?—Yes.

13,076. Is the supply large ?—Yes.

13,077. Is the price lower this year ?—Yes, very low indeed ; in fact some days ago we could hardly give them away.

13,078. Is the quality of the bloaters this year as good as usual ?—No, very inferior. Some days we get a supply of all full-roed herring, and the next they are all shotten and spent herring.

13,079. Then there is an increase in the supply of bloaters ?—Yes, a vast increase.

13,080. Do you sell smoked haddock ? — Frequently.

13,081. Is there an increase or diminution in them ?—I think there is a decrease in the quantity imported from the north country, but we have opened a trade here in smoking the trawled haddocks, so that we get an ample trade now without going to Scotland for them, and I have no doubt the fish are equally as good.

13,082. Then the supply is as large as it was ?—I believe it is larger.

13,083. But it is a home supply ?—Yes.

13,084. Do you sell dried cod ? — Yes, great quantities.

13,085. Where is it brought from ?—A great deal is consigned from Labrador and Newfoundland.

13,086. Is that supply increasing or diminishing ?—It has diminished lately. The price has also decreased. We have had a good deal from Scotland.

13,087. What is the reason the supply has decreased ?—The fishing has been very bad on both stations at Newfoundland. But in the north I believe it has been very good this year.

13,088. Do you sell barrelled cod ?—Yes.

13,089. What kind of cod is that ?—We have had some very superior from the north of Scotland this year.

13,090. Is it chiefly salt-fish ?—Yes. It is sent up in salt pickled in the barrels from Peterhead, Wick, and Edinburgh. I think there was an increased supply last year. They get them at the Faroe Islands, and they cure them for the Mediterranean and Spain. Very little comes here.

13,091. Have you any knowledge of shell-fish ?—Yes, of lobsters and crabs.

13,092. Is the supply of lobsters increasing or diminishing ?—It is decreasing.

13,093. Have you had any reason assigned for that decrease ?—No.

13,094. Is the price decreasing ?—I do not see any difference.

13,095. Is the supply of crabs increasing or diminishing ?—I don't think there has been much decrease in them. We have had a vast quantity at certain times of the year from the north. In fact, on some days the low prices which they fetched never could have paid them.

13,096. Do you know anything of the supply of shrimps ?—No.

13,097. (*Mr. Lefevre.*) You say that you get fresh herrings now all the year round ?—Mostly.

13,098. Where do they come from ?—We get them from Yarmouth at this time of the year.

13,099. Until when do you get fresh herrings from Yarmouth ?—Until about Christmas time.

13,100. Where do they come from after that ?—From Plymouth.

13,101. How long does that go on ?—I can hardly tell you ; about a month. I know we get them altogether nearly all the year round.

13,102. I should like to have the order of the places from which they come ?—I can hardly tell you the places in rotation. I don't get herrings from all these places although I know they are here. Most of those I get come from the north coast.

13,103. What is the earliest place from the north coast ?—From Scotland.

13,104. Do they come up fresh from Scotland ?—Yes. The first herrings we get are the spring herrings from Lowestoft.

13,105. What sort of herrings are they ?—They are very inferior. They ought never to be caught. I think they do an injury to every branch of the fishery. Sometimes they are sold as manure.

13,106. Are they bought by the lowest classes here ?—Yes, and even they cannot turn them into food. They are like lumps of chips to eat.

13,107. What is the quantity that comes to London ?—There is a very large quantity. Some boats go out and get a large haul and sell them at 2*d.* per 100.

13,108. Do large quantities come up to London ?—

Yes, and loads of them lie here. They cannot be sold at any price whatever.

13,109. After these spring herrings when do you get other herrings?—We next get the midsummer herring and the Isle of Man herring. They are a very fine class of fish.

13,110. When do you get them?—At the latter end of May and June.

13,111. They go to Liverpool I suppose, and are sent on here by train?—Yes, they come from Douglas to Liverpool by the steamer, and the midsummer herrings come from Yarmouth.

13,112. Do you think that the prohibition of the catch of spring herrings at Lowestoft would be beneficial?—Yes, to every class of fisherman. We have noticed this last year that the catch of the midsummer herring has nearly ceased. There has been a great decrease for the last year or two.

13,113. Have you observed any decrease in the quantity of the autumn herrings?—No.

13,114. They are caught off the same coast?—Yes.

13,115. Do you agree with the witness who told us that there is not so large a proportion of fish exported from London to the provincial towns as there was formerly?—I cannot answer for fresh fish, but there is a great quantity of dried fish sent off every day. I myself often send 200 or 300 pads of fish into the country.

13,116. Do you buy as well as sell?—Yes, I receive orders from all parts of the west of England. The herrings sent from London are chiefly sent to the West of England. I think that is chiefly because the railway does not run direct to the west of England. They therefore do not supply the west. We have the orders in London, and send the fish away.

13,117. London is the depôt?—Yes, at this time of the year.

13,118. Is it the same with respect to trawled fish brought into the port of London?—A great deal of fresh fish of all kinds goes in that way. They go away daily both to the West of England and to the midland counties.

13,119. Do you send the inferior qualities as well as the superior?—We don't send an inferior quality to these people. If we did they would soon send them back again.

13,120. I mean the inferior classes of fish—what they call the offal?—Yes, there are plenty sent to the provincial towns. They use a deal of offal fish. When the fish is of good quality I can send from 20 to 30 baskets of plaice, and 20 or 30 baskets of haddocks. I often receive orders to send down five or six pads of plaice, but I cannot send them because they fetch a high price in Billingsgate.

13,121. I suppose the telegraph has done a good deal towards equalizing the price all over the country?—Yes, we ourselves telegraph to state the prices.

13,122. Has that telegraphing told much on the price of fish in London?—I think it has increased the value of fish here in the market.

13,123. (*Mr. Caird.*) Do any pilchards come to the London market?—Very few. I have seen a few this year, but hardly any worth naming. In former years we got a great quantity from Yarmouth and Lowestoft at this time of the year, but I have seen none lately.

13,124. Do you sell many lobsters in the state called "berried"?—No.

13,125. Do they not come into the London market in that state?—No doubt they do.

13,126. Do you think they come in that state in large quantities?—I don't know.

13,127. Do you know whether they are preferred in that state?—I don't think they are.

13,128. Is there one of the inspectors here?—Not in the room. We have two in the market, but the market now is nearly over, and they will be going away.

13,129. Have the inspectors this year ordered a large quantity of fish to be destroyed?—I don't think they have. I have not seen any great quantity. In fact, on some days people have been obliged to go away without any fish at all. They say: "What are you "going to do with us, do you mean to starve us? We "have been a fortnight without any haddocks or "plaice." That is a cry I have heard day after day and week after week.

13,130. Has there been a decrease in the quantity of fish this year?—There has been an increase in the customers as there has been an increase in the population.

13,131. The demand is increasing?—The demand is increasing faster than we can get the fish.

The witness withdrew.

WILLIAM EDWARDS called and examined.

W. Edwards.

13,132. (*Mr. Caird.*) Are you a fish salesman in London?—I have been a fish salesman about 17 years—not the whole time in London, but a portion of the time at Hastings in the county of Sussex. I was a trawler, a herring man, and a mackerel and line fisher 35 years before that.

13,133. Do you sell all the different kinds of fish that come to the London market?—Not all; I am not much acquainted with oysters, whelks, and the like of that.

13,134. But all other kinds of fish?—Yes, the greatest portion of them.

13,135. Do you think during the time you have been engaged as a fish salesman that the supply of fish to the London market has increased or diminished?—It has increased wonderfully this summer, especially with regard to coast plaice caught on the coast from here and off Margate sands and the Kentish Knock.

13,136. That increase has been especially in plaice?—Especially in plaice this summer.

13,137. Is that upon ground that has long been trawled upon?—From the time of my first going to sea, including the time of the man I was apprenticed to, will be upwards of 110 years. His time and mine will extend to that, and I have heard him say that every year in his experience more fish came.

13,138. Then you can speak from your own experience and the experience of the man you were apprenticed to, over a period of 110 years?—Yes, from what I recollect him saying and from what I recollect myself.

13,139. During all that time the system of trawl-fishing has been practised on the coast to which you refer?—Yes.

13,140. That is on the Sussex and Kent coasts?—Yes.

13,141. During that time the same grounds have been trawled over?—Yes.

13,142. Do you find now that the catch of fish on those grounds is as good as it used to be?—Better.

13,143. You think it is improving?—Yes.

13,144. There are more vessels upon it?—Yes, more this summer than ever.

13,145. Do the same vessels take more fish than they used to do?—The same vessels take more fish than they ever did.

13,146. Each vessel has a larger catch?—Yes, larger this summer than ever I knew before.

13,147. Then from your own knowledge and experience, you don't agree with those who say that the fishing grounds have been fished out?—No.

13,148. You think there is no foundation for such a statement?—Not in the least. A few years ago—as far back as 30 years ago—I have known in the month of May a great many turbots and doreys caught with the hook off Hastings, and at the same time they have been caught in the trawl. But they never come now, they seem to have entirely forsaken the ground.

13,149. Do you mean where the trawlers go?—Both where hookers and trawlers go. The liners fish a few miles from the coast on the rough ground, while

BILLINGSGATE.

W. Edwards.

18 Nov. 1863.

the trawlers go further out amongst the smooth ground.

13,150. They seem to have forsaken that ground?—Yes, entirely. Yet within a few miles of it on the banks there are as many turbot as ever.

13,151. For what reason do you imagine they have changed their fishing ground?—I think the small quantity of mackerel in the English Channel of late years has something to do with it.

13,152. What have they to do with it?—There is nothing for them to feed upon. I believe all ground-fish feed upon the fish of the season, whether mackerel or herring. For instance, at this time of the year, I think it would be of no use to bait the hook with mackerel in order to catch turbot, but if it is baited with herring I think he will take it.

13,153. Speaking of the supply of turbot to the London market, has there been any decrease in it?—No, there has been a large increase this year.

13,154. Is the quality as good as ever it used to be?—Yes.

13,155. And of all other kinds of fish that come here?—Yes, because the facilities for exportation are greater.

13,156. Do you hold the opinion that any increased demand can be met by an increased supply?—I don't know; it is rather curious to say that.

13,157. Have you found in your experience that an increased demand has hitherto been met by an increased supply?—Yes.

13,158. Have you seen any reason to doubt that it would continue to be the same?—Not at all. We keep improving the net and tackle that we use, and we go wherever we think there is a fresh spot of ground. In the year 1838, I believe, I was the first man who ever broke out of Rye Bay to go to what was then called "No Rest," in a south-westerly direction from Dungeness in the English Channel. Formerly we never thought of going down on the western tide in more than six or seven, or eight fathoms of water, and then we had the lead constantly going. If we dropped into a little greater draught of water it was haul in towards the banks directly; but now we go into 24, 25, or 26, or even 30 fathoms, both English and French. I know one piece of ground now that I intend to go over next year.

13,159. Do you expect on ground that has never been trawled over to get more fish?—Yes.

13,160. That does not seem to be the opinion of others?—These fish have never been disturbed; and we always find if there is a certain class of fish which we can catch lying between two railways that it pays us to fish there. If we find fish there we can cover the one market or the other every day, so as to have the fish in London the morning after it is caught.

13,161. (*Mr. Lefevre.*) Any wind will serve?—Yes.

13,162 (*Mr. Caird.*) Do you regulate your fishing by the facilities you have of coming to market?—Yes, if possible.

13,163. Do your vessels make that in some degree a guide as to the places where they will try for fish?—Yes, and the drifters have a little to do with it.

13,164. What are the drifters?—The herring and mackerel boats. Their nets float on the water, and you can't fish with the trawl among them. You are far better off if you are 7, 8, or 10 miles under their lee.

13,165. (*Mr. Lefevre*). You know it is illegal to fish within three miles of them?—Yes, I am aware of that. On the coast of Suffolk I could catch plenty of large soles, larger than are now coming to Billingsgate but I don't go there because I know there is a fleet of herring men there.

13,166. (*Mr. Caird.*) Independent of the Acts of Parliament, it would be inconvenient for you to fish where the herring men are?—No trawler wishes to go where there are drifters.

13,167. I think you said that some change has been made in your trawls?—Yes.

13,168. What change has been made within your experience?—In former years we used a beam running from 27 or 28 feet up to 42. Now the general run of the beam with the improved kind of vessels is from 36 to 42 feet.

13,169. Have you altered the mesh?—The mesh is about the same. I think no one can regulate the mesh better than the fisherman who uses it. It is not to his interest to destroy the goose that lays the golden eggs. That would not pay him, and the matter therefore may be safely left in his hands. I know what the Act of Parliament says, but I never adhered to it very strictly myself.

13,170. (*Mr. Lefevre.*) You have nobody to look after your nets?—No.

13,171. You think it would be better left to you to decide what beam and mesh you should use?—Yes, it would be of no use to put an old-fashioned beam alongside of these vessels now. A beam no thicker than my arm and heads 160 lbs in weight would be of very little use for the vessels we use now, some of them upwards of 60 tons. They would run away as if they had nothing at all overboard.

13,172. Then you think it is not unusual for the trawlers to have a beam larger than the legal size?—Yes, the generality of them are larger than the legal size, and the heads are of greater weight; we have one vessel with trawl heads 4 cwt. and if she breaks her beam again we are going to have an iron one. I certainly mean to try it. There is the same improvement in the drift-net fishing. When I first went herring catching it was a good fleet to have 50 pieces 7 or 10 deep. Now we have about 70 with 101 pieces in each fleet each 11 score deep. You were asking just now about the mackerel that came from Norway. This very year they fell off in the Channel the very day they came from Norway. We had 8,600 pads on the coast on Monday, but I don't think there were 600 on the whole coast during the season afterwards.

13,173. (*Mr. Caird.*) Do you think the fish had gone across?—No; there was no breeze in the bay for the drifters, and you can't catch them without a breeze.

13,174. Do you agree with the other witnesses as to the supply of fish to the London market keeping progressive?—Yes, I believe it is on the increase every year.

13,175. Do you agree that the principal supply is furnished by trawl-vessels?—Yes.

13,176. A very large proportion of it?—Yes, I should say more than 100 to 1.

13,177. Has the price increased or diminished, or continued stationary, on the average, in your experience?—I think the price is about the same as it was when I first went. We had very cheap fish then, and very dear fish; it is now a little more equalised. Last week and this week we consider exceptions, but it is much the same, taking 12 months. I think the price is much more equal than it was. From the 1st of January to the end of December I don't see much difference, taking one year with another. There is no 14*l.* or 15*l.* for a little basket of fish now; and we seldom get only 2*s.* or 3*s.* for a basket. I have been selling 100 mackerel at Brighton for 18 guineas, and I have ended in the same season by selling them for 4*s.* a hundred.
